PRINCIPAL UNSIGNED ARTICLES

AUSTRIA, LOWER (Ger. Niederösterreich or Österreich unter der Enns, "Austria below the river Enns"), an archduchy and crownland of Austria, bounded E. by Hungary, N. by Bohemia and Moravia, W. by Bohemia and Upper Austria, and S. by Styria. It has an area of 7658 sq. m. and is divided into two parts by the Danube, which enters at its most westerly point, and leaves it at its eastern extremity, near Pressburg. North of this line is the low hilly country, known as the Waldviertel, which lies at the foot and forms the continuation of the Bohemian and Moravian plateau. Towards the W. it attains in the Weinberger Wald, of which the highest point is the Peilstein, an altitude of 3478 ft., and descends towards the valley of the Danube through the Gföhler Wald (2368 ft.) and the Manhartsgärberge (1758 ft.). Its most south-easterly offshoots are formed by the Bisamberg (1180 ft.), near Vienna, just opposite the Kahlenberg. The southern division of the province is, in the main, mountainous and hilly, and is occupied by the Lower Austrian Alps and their offshoots. The principal groups are: the Voralpe (5802 ft.), the Dürrenstein (6156 ft.), the Ötscher (6205 ft.), the Raxalpe (6589 ft.) and the Schneeberg (6806 ft.), which is the highest summit in the whole province. To the E. of the famous ridge of Semmering are the groups of the Wechsel (5700 ft.) and the Leithagebirge (1674 ft.). The offshoots of the Alpine group are formed by the Wiener Wald, which attains an altitude of 2029 ft. in the Schöpf and ends N.W. of Vienna in the Kahlenberg (1404 ft.) and Leopoldsberg (1380 ft.).

Lower Austria belongs to the watershed of the Danube, which with the exception of the Lainsitz, which is a tributary of the Moldau, receives all the other rivers of the province. Its principal affluents on the right are: the Enns, Ybbs, Erlauf, Pielach, Traisen, Wien, Schwechat, Fischa and Leitha; on the left the Isper, Krems, Kamp, Göllersau and the March. Besides the Danube, only the Enns and the March are navigable rivers. Amongst the small Alpine lakes, the Erlaufsee and the Lunzer See are worth mentioning. Of its mineral springs, the best known are the sulphur springs of Baden, the iodine springs of Deutsch-Altenburg, the iron springs of Pyrawarth, and the thermal springs of Vöslau. In general the climate, which varies with the configuration of the surface, is moderate and healthy, although subject to rapid changes of temperature. Although 43.4% of the total area is arable land, the soil is only of moderate fertility and does not satisfy the wants of this thickly-populated province. Woods occupy 34.2%, gardens and meadows 13.1% and pastures 3.2%. Vineyards occupy 2% of the total area and produce a good wine, especially those on the sunny slopes of the Wiener Wald. Cattle-rearing is not well developed, but game and fish are plentiful. Mining is only of slight importance, small quantities of coal and iron-ore being extracted in the Alpine foothill region; graphite is found near Mühldorf. From an industrial point of view, Lower Austria stands, together with Bohemia and Moravia, in the front rank amongst the Austrian provinces. The centre of its great industrial activity is the capital, Vienna (q.v.); but in the region of the Wiener Wald up to Semmering, owing to its many waters, which can be transformed into motive power, many factories are spread. The principal industries are, the metallurgic and textile industries in all their branches, milling, brewing and chemicals; paper, leather and silk; cloth, objets de luxe and millinery; physical and musical instruments; sugar, tobacco factories and foodstuffs. The very extensive commerce of the province has also its centre in Vienna. The population of Lower Austria in 1900 was 3,100,493, which corresponds to 405 inhabitants per sq. m. It is, therefore, the most densely populated province of Austria. According to the language in common use, 95% of the population
AUSTRIA, UPPER—AUSTRIA-HUNGARY

was German, 4.66% was Czech, and the remainder was composed of Poles, Slovaks, Ruthenians, Croats and Italians. According to the religion 92.47% of its inhabitants were Roman Catholics; 9.07% were Jews; 2.22% were Protestants and the remainder, belonging to the Greek church. In the matter of education, Lower Austria is one of the most advanced provinces of Austria, and 99.8% of the children of school-going age attended school regularly in 1900. The local diet is composed of 78 members, of which the archbishop of Vienna, the bishop of St Pölten and the rector of the Vienna University are members ex officio. Lower Austria sends 64 members to the Imperial Reichsrat at Vienna. For administrative purposes, the province is divided into 22 districts and three towns with autonomous municipalities: Vienna (1,662,269), the capital (since 1905 including Floridsdorf, 36,991), Wiener-Neustadt (28,438) and Waidhofen on the Ybbs (4447). Other principal towns are: Baden (12,447), Bruck on the Leitha (5134), Schwechat (8241), Korneuburg (8208), Stokerau (10,213), Krems (12,657), Mödling (15,304), Reichenaun (7457), Neunkirchen (10,831), St Pölten (14,510) and Klosterneuburg (11,595). The original archduchy, which included Upper Austria, is the nucleus of the Austrian empire, and the oldest possession of the house of Habsburg. For its history see the article Austria. See F. Umlauf, Das Erzherzogtum Österreich unter den Enns, vol. i. of the collection Die Länder Österreich-Ungarns in Wort und Bild (Vienna, 1881–1889, 15 vols.); Die österreichisch-ungarische Monarchie in Wort und Bild, vol. 4 (Vienna, 1886–1902, 24 vols.).

AUSTRIA, UPPER (Ger. Oberösterreich or Österreich ob der Enns, "Austria above the river Enns"). an archduchy and crown-land of Austria, bounded N. by Bohemia, W. by Bavaria, S. by Salzburg and Styria, and E. by Lower Austria. It has an area of 4,651 sq. m. Upper Austria is divided by the Danube into two unequal parts. Its smaller northern part is a prolongation of the southern angle of the Bohemian forest and contains as culminating points the Plöckstein (4510 ft.) and the Sterntal (3690 ft.). The southern part belongs to the region of the Eastern Alps, containing the Salzkammergut and Upper Austrian Alps, which are found principally in the district of Salzkammergut (q.v.). To the north of these mountains, stretching towards the Danube, is the Alpine foothill region, composed partly of terraces and partly of swelling mountainous formations, on which agriculture is important. The Danube, the most important river of Austria-Hungary, is the chief water-fall of the country. It is a wooded chain of waterfalls, with many branches, rich in brown coal and calcining in the Gößberg (2950 ft.). Upper Austria belongs to the watershed of the Danube, which flows through it from west to east, and receives here on the right the Inn with the Salzach, the Tauern, the Enns with the Steyr and on its left the Great and Little Mühl rivers. The Schwarzenberg canal between the Great Mühl and the Moldau establishes a direct navigable route between the Danube and the Elbe. The climate of Upper Austria, which varies according to the altitude, is, on the whole; moderate; it is somewhat severe in the north, but is mild in Salzkammergut. The population of the duchy in 1900 was 809,918, which is equivalent to 174.8 inhabitants per sq. m. It has the greatest density of population of any of the Alpine provinces. The inhabitants are almost exclusively of German stock and Roman Catholics. For administrative purposes, Upper Austria is divided into two autonomous municipalities, Linz (38,778) the capital, and Steyr (37,552) and 12 districts. Other principal towns are Wels (12,187), Ischl (6646) and Gmunden (7126). The local government, under the bishop of Linz is ex officio, is composed of 50 members, who are appointed by the emperor, who has the title of Reichskanzler, on the advice of the Reichsrat at Vienna. The soil in the valleys and on the lower slopes of the hills is fertile, indeed 35.08% of the whole area is arable. Agriculture is well developed and relatively large quantities of the principal cereals are produced. Upper Austria has the largest proportion of meadows in all Austria, 18.54%, while 2.49% is lowland and Alpine pasture. Of the remainder, woods occupy 34.05%, gardens 1.99% and 40.63% is unproductive. Cattle-breeding is also in a very advanced stage and together with the timber-trade forms a considerable resource of the province. The principal mineral wealth of Upper Austria is salt, of which it extracts nearly 50% of the total Austrian production. Other important products are lignite, gypsum and a variety of valuable stones and clays. There are about thirty mineral springs, the best known being the salt baths of Ischl and the iodine waters at Hall. The principal industries are the iron and metal manufactures, chiefly centred at Steyr. Next in importance are the machine, linen, cotton and paper manufactures, the milling, brewing and distilling industries and shipbuilding. The principal articles of export are salt, stone, timber, live-stock, woollen and iron wares and paper.

See Edbacher, Landeskunde von Oberösterreich (Linz, 2nd ed., 1883); Vanssa, op. cit. in the preceding article.

AUSTRIA-HUNGARY, or the Austro-Hungarian Monarchy (Ger. Österreichisch-ungarische Monarchie or Österreichisch-ungarisches Reich), the official name of a country situated in central Europe, bounded E. by Russia and Rumania, S. by Rumania, Servia, Turkey and Montenegro, W. by the Adriatic Sea, Italy, Switzerland, Liechtenstein, and the German Empire, and N. by the German Empire and Russia. It occupies about the sixteenth part of the total area of Europe, with an area (1905) of 239,077 sq. m. The monarchy consists of two independent states, the former Emperor Franz Joseph I and the latter the emperor of the empire (Reichskanzler), unoffically called Austria (q.v.) or Cisleithania; and the "lands of St Stephen's Crown," unoffically called Hungary (q.v.) or Transleithania. It received its actual name by the diploma of the emperor Francis Joseph I. of the 14th of November 1868, replacing the name of the Austrian Empire under which the dominions under his sceptre were formerly known. The Austro-Hungarian monarchy is very often called unoffically the Dual Monarchy. It had in 1901 a population of 45,405,267 inhabitants, comprising therefore within its borders, about one-eighth of the total population of Europe. By the Berlin Treaty of 1878 the principalities of Bosnia and Herzegovina with an area of 19,702 sq. m., and a population (1895) of 1,591,936 inhabitants, owning Turkey as suzerain, were placed under the administration of Austria-Hungary, and their annexation in 1908 was recognized by the Powers in 1909, so that they became part of the dominions of the monarchy.

Government.—The present constitution of the Austro-Hungarian monarchy (see AUSTRIA) is based on the Pragmatic Sanction of 1713, whereby the succession to the throne is settled in the dynasty of Habsburg-Lorraine, descending by right of primogeniture and lineal succession to male heirs, and, in case of their extinction, to the female line, and whereby the indivisibility and indivisibility of the monarchy are determined; is based, further, on the diploma of the emperor Francis Joseph I. of the 20th of October 1860, whereby the constitutional form of government is introduced; and, lastly, on the so-called Ausgleich or "Compromise," concluded on the 8th of February 1867, whereby the relations between Austria and Hungary were regulated.

The two separate states—Austria and Hungary—are completely independent of each other, and each has its own parliament and its own government. The unity of the monarchy is expressed in the common head of the state, who bears the title Emperor of Austria and Apostolic King of Hungary, and in the common administration of a series of affairs, which affect both halves of the Dual Monarchy. These are: (1) foreign affairs, including diplomatic and consular representation abroad; (2) military affairs, including the armed forces and the annual voting of recruits, and the special army of each state; (3) finance in so far as it concerns joint expenditure.

For the administration of these common affairs there are three joint ministries: the ministry of foreign affairs and of the imperial and royal house, the ministry of war, and the ministry of finance. It must be noted that the authority of the joint ministers is restricted to common affairs, and that they are not allowed to direct or exercise any influence on affairs of government affecting separately one of the halves of the monarchy.
The minister of foreign affairs conducts the international relations of the Dual Monarchy, and can conclude international treaties. But commercial treaties, and such state treaties as impose burdens on the state, or parts of the state, or involve a change of territory, require the parliamentary assent of both states. The minister of war is the head for the administration of all military affairs, except those of the Austrian Landwehr and of the Hungarian Honvéd, which are committed to the ministries for national defence of the two respective states. But the supreme command of the army is vested in the monarch, who has the power to take all measures regarding the whole army. It follows, therefore, that the total armed power of the Dual Monarchy forms a whole under the supreme command of the sovereign. The minister of finance has charge of the finances of common affairs, prepares the joint budget, and administers the joint state debt. (Till 1906 the provinces of Bosnia and Herzegovina were also administered by the minister of finance, excepting matters exclusively dependent on the minister of war.) For the control of the common finances, there is appointed a joint supreme court of accounts, which audits the accounts of the joint ministries.

**Budget.** Side by side with the budget of each state of the Dual Monarchy, there is a common budget, which comprises the expenditure necessary for the common affairs, namely for the conduct of foreign affairs, for the army, and for the ministry of finance. The revenues of the joint budget consist of the revenues of the joint ministries, the net proceeds of the customs, and the quota, or the proportional contributions of the two states. The quota is fixed for a period of years, and generally coincides with the duration of the customs and commercial treaty. Until 1897 Austria contributed 70% and Hungary 30% of the joint expenditure, remaining after deduction of the common revenue. It was then decided that from 1897 to July 1907 the quota should be 60% for Austria and 33 1/3% for Hungary. In 1907 Hungary’s contribution was raised to 36 4/10%. Of the total charges 2% is first of all debited to Hungary on account of the incorporation with this state of the former military frontier.

The Budget estimates for the common administration were as follows in 1905:

**Debt.** Besides the debts of each state of the Dual Monarchy, there is a general debt, which is borne jointly by Austria and Hungary. The following table gives in millions sterling the amount of the general debt for the years 1875-1905:

<table>
<thead>
<tr>

**Delegations.** The constitutional right of voting money applicable to the common affairs and of its political control is exercised by the Delegations, which consists of sixty members, chosen for one year, one-third of them by the Austrian Herrenhaus (Upper House) and the Hungarian Table of Magnates (Upper House), and two-thirds of them by the Austrian and the Hungarian Houses of Representatives. The delegations are annually summoned by the monarch alternately to Vienna and to Budapest. Each delegation has its separate sitting, both alike public. Their decisions are reciprocally communicated in writing, and, in case of non-agreement, their deliberations are renewed. Should three such interchanges be made without agreement, a common plenary sitting is held of an equal number of both delegations; and these collectively, without discussion, decide the question by common vote. The common decisions of both houses require for their validity the sanction of the monarch. Each delegation has the right to formulate resolutions independently, and to call to account and arraign the common ministers. In the exercise of their office the members of both delegations are irresponsible, enjoying constitutional immunity.

**Army.** The military system of the Dual Monarchy is similar in both states, and rests since 1868 upon the principle of the universal and personal obligation of the citizen to bear arms. Its military force is composed of the common army (K. und K.); the special armies, namely the Austrian (K.K.) Landwehr, and the Hungarian Honvéd, which are separate national institutions, and the Landsturm or levy-in-mass. As stated above, the common army stands under the administration of the joint minister of war, while the special armies are under the administration of the respective ministries of national defence. The yearly contingent of recruits for the army is fixed by the military bills voted by the Austrian and Hungarian parliaments, and is generally determined on the basis of the population, according to the last census returns. It amounted in 1905 to 103,100 men, of which Austria furnished 59,211 men, and Hungary 43,889. Besides 10,000 men are annually allotted to the Austrian Landwehr, and 12,500 to the Hungarian Honvéd. The term of service is 2 years (3 years in the cavalry) with the colours, 7 or 8 in the reserve and 2 in the Landwehr; in the case of men not drafted to the active army the same total period of service is spent in various special reserves.

For the military and administrative service of the army the Dual Monarchy is divided into 16 military territorial districts (15 of which correspond to the 15 army corps) and 108 supplementary districts (105 for the army, and 3 for the navy). In 1902, since which year no material change was made in the formal organization of the army, there were 5 cavalry divisions and 31 infantry divisions, formed in 15 army corps, which are located as follows:—1. Cracow, II. Vienna, III. Graz, IV. Budapest, V. Pressburg, VI. Temesvár, VII. Prague, IX. Josephstadt, X. Peresznye, XI. Lemberg, XII. Hermannstadt, XIII. Agram, XIV. Innsbruck, XV. Sarajewo. In addition there is the military district of Zara. The usual strength of cavalry divisions (4 brigades, 8 or 9 regiments, 32 or 36 battalions), 1 cavalry brigade (18 squadrons), and 1 artillery brigade (16-18 batteries or 1 heavy, 1 field, 1 mountain) can be organized within the framework of the army budget. The infantry is organized into line regiments, Jäger and Tirolese regiments, the cavalry into dragoons, lancers, Uhans and hussars, the artillery into regiments. The Austrian Landwehr (which retains the old designation K.K.) formerly
AUSTRIA-HUNGARY

applied to the Austrian regular army) is organized in 8 divisions of varying strength, the "Royal Hungarian" Landwehr or Honvéd in 7 divisions, both Austrian and Hungarian Landwehr having in addition cavalry (Uhlans and hussars) and artillery. It is probable that a Landwehr or Honvéd division will, in war, form part of each army corps except in the case of the Vienna corps, which has 3 divisions of peace. The remaining men of military age (up to 42) as usual form the Landsturm. It is to be noted that this Landsturm comprises many men who would elsewhere be classed as Landwehr.

The strength of the Austro-Hungarian army on a peace footing was as follows in 1905:

<table>

The troops stationed in Bosnia and Herzegovina in 1905 (376 officers and 6372 men) are included in the total for the common army.

The peace strength of the active army in combattants is thus about 350,000 officers and men, inclusive of the two Landwehr and the Austrian artillery, cavalry, and infantry, and the 2nd class guards, the Hungarian artillery, guards, the gendarmerie, &c. The numbers of the Landsturm and the war strength of the whole armed forces are not published. It is estimated that the first line army in war would consist of 400,000 infantry, 49,000 cavalry, 76,000 artillery, 21,000 engineers, &c., besides train and non-combatant soldiers. The Landwehr and Honvéd would yield 210,000 infantry and 18,000 cavalry, and other reserves 223,000 men. These figures give an approximate total strength of 1,147,000, not inclusive of Landsturm.

The principal fortifications in Austria-Hungary are: Cracow and Przemysl in Galicia; Komirá, the centre of the inland fortifications, Pętárvarad, Z-Arad and Temesvár in Hungary; Sremsko, Mostar and Biak in Bosnia-Herzegovina. The fortifications, especially those in Tirol, have numerous fortifications whose centre is formed by Trent and Frangesfeste; while all the military roads leading into Carinthia have been provided with strong defensive works, as at Malborgeth, Predik Pass, &c. The two capitals, Vienna and Budapest, on the Adriatic coast, the naval harbour of Pola is strongly fortified with sea and land defences; hence come Trieste, and several places in Dalmatia, notably Zara and Cattaro.

The Austro-Hungarian navy is mainly a coast defence force, and includes also a flotilla of monitors for the Danube. It is administered by the naval department of the ministry of war.

The most important place of derivation and of destination for the Austro-Hungarian trade is the German empire with about 40% of the imports, and about 60% of the exports. Next in importance comes Great Britain, afterwards Italy, 100, United States of America, Russia, Switzerland, Belgium, the Balkan states and South America in about the order named. The principal articles of import are cotton and cotton goods, wool and woolen goods, silk and silk goods, coffee, tobacco and metals. The principal articles of export are wood, sugar, cattle, glass and glassware, iron and ironware, eggs, cereals, millinery, fancy goods, earthenware and pottery, and leather goods.

The Austro-Hungarian Bank.—Common to the two states of the monarchy is a "Austro-Hungarian Bank," which possesses a legal exclusive right to the issue of bank-notes. It was founded in 1816, and had the title of the Austrian National Bank until 1878, when it received its actual name. In virtue of the new bank statute of the year 1899 the bank is a joint-stock company, with a stock of 8,780,000 crowns. The bank's notes of issue must be covered to the extent of two-fifths by legal specie (gold and current silver) in reserve; the rest of the paper circulation, according to bank usage. The state, under certain conditions, takes a portion of the clear profits of the bank, and the supervision exercised over it by the state are established on a footing of equality, both states having each the same influence. The accounts of the bank at the end of 1900 were as follows: capital, £8,750,000; bank's reserve fund, £48,250; note circulation, £62,251,000; cash, £55,754,000. In 1907 the reserve fund was £54,029; note circulation, £58,101,000; cash, £50,036,625. The charter of the bank, which expired in 1897, was renewed until the end of 1910. In the Hungarian ministerial crisis of 1899 the question of the renewal of the charter played a conspicuous part, the more extreme members of the Independent party demanding the establishment of separate banks for Austria and Hungary with, at most, common superintendence (see History, below).

The empire of Austria, as the official designation of the territories ruled by the Habsburg monarchy, dates back only to 1804, when Francis II., the last of the Holy Roman emperors, proclaimed himself emperor of Austria as "Emperor Francis I. His motive in so doing was to guard against the great house of Habsburg being relegated to a position inferior to the "Leopold Bonaparte," in the event of a final collapse of the Holy Roman Empire, or of the possible election of Napoleon as his own successor on the throne of Charlemagne. The title emperor of Austria, then, replaced that of "Imperator Romanorum semper Augustus" when the Holy Empire came to an end in 1806. From the first, however, it was no more than a title, which represented but ill the actual relation of the Habsburg sovereigns to their several states.

king of Bohemia. The interests of the Austrian margraves and dukes were not confined to the acquisition of wealth either in land or chattels. Vienna became a centre of culture and learning, and many religious houses were founded and endowed. The acme of the early prosperity of Austria was reached under Duke Leopold II., surnamed the Glorious, who reigned from 1194 to 1230. He gave a code of municipal law to Vienna, and rights to other towns, welcomed the Minnesingers to his brilliant court, and left to his subjects an enduring memory of valour and wisdom. Leopold and his predecessors were enabled, owing to the special position of Austria, to act practically as independent rulers. Cherishing the privilege of 1156, they made treaties with foreign kings, and arranged marriages with the great families of Europe. With full control of jurisdiction and of commerce, no great bishopric nor imperial city impeded the course of their authority, and the emperor interfered only to settle boundary disputes.

The main lines of Austrian policy under the Babenbergs were warfare with the Hungarians and other eastern neighbours, and a general attitude of loyalty towards the emperors. The story of the Hungarian wars is a monotonous record of defeats, and the assistance given to them was not the last of the fortunes of the Empire and ending in the gradual eastern advance of Austria. The traditional loyalty to the emperors, which was cemented by several marriages between the imperial house and the Babenbergs, was, however, departed from by the margrave Leopold II., and by Duke Frederick II. During the investiture struggle Leopold deserted the emperor Henry IV., who deprived him of Austria and conferred it upon Vratislav II., duke of the Bohemians. Unable to maintain his position, Vratislav was soon driven out, and in 1083 Leopold again obtained possession of the mark, and was soon reconciled with Henry. Very similar was the result of the conflict between the emperor Frederick II. and Duke Frederick II. Ignoring the privilege of 1156, the emperor claimed certain rights in Austria, and summoned the duke to his Italian diets. Frederick, who was called the Quarelsome, had irritated both his neighbours and his subjects, and complaints of his exactions and confiscations reached the ears of the emperor. After the duke had three times refused to appear before the princes, Frederick placed him under ban, declared the Babenbergs of Austria and Styria to be vacant, and, aided by the king of Bohemia, the duke of Bavaria and other princes, invaded the country in 1236. He met with very slight opposition, declared the duchies to be immediately dependent upon the Empire, made Vienna an imperial city, and imposed other changes upon the constitution of Austria. After his departure, however, the duke returned, and in 1239 was in possession of his former power, while the changes made by the emperor were ignored. Continuing his career of violence and oppression, Duke Frederick was killed in battle by the Hungarians in June 1246, when the family of Babenberg became extinct.

The duchies of Austria and Styria were now claimed by the emperor Frederick II. as vacant feuds of the Empire, and their government was entrusted to Otto II., duke of Bavaria. Frederick, however, who was in Italy, harassed and afflicted, could do little to assert the imperial authority, and his enemy, Pope Innocent IV., bestowed the two duchies upon Hermann V., count of Styria, whose wife, by the way, was a niece of the Babenbergs. Hermann was invested by the German king, William, count of Holland, but he was unable to establish his position, and law and order were quickly disappearing from the duchies. The deaths of Hermann and of the emperor in 1250, however, paved the way for a settlement. Weary of struggle and disorder, and despairing of any help from the central authority, the estates of Austria met at Trübensee in 1251, and chose Ottakar, son of Wenceslaus I., king of Bohemia, as their duke. This step was favoured by the pope, and Ottakar, eagerly accepting the offer, strengthened his position by marrying Margaret, a sister of Duke Frederick II., and in return for his investiture promised

his assistance to William of Holland. Styria appears at this time to have shared the fortunes of Austria, but it was claimed by Bela IV., king of Hungary, who conquered the land, and made a treaty with Ottakar in 1254 which confirmed him in his possession. The Hungarian rule was soon resented by the Styrians, and Ottakar, who had become king of Bohemia in 1253, took advantage of this resentment, and interfered in the affairs of the duchy. A war with Hungary was the result, but on this occasion victory rested with Ottakar, and by a treaty made with Bela, in March 1261, he was recognized as duke of Styria. In 1269 Ottakar inherited the duchy of Carinthia on the death of Duke Ulrich III., and, his power having now become very great, he began to aspire to the German throne. He did something to improve the condition of the duchies by restoring order, introducing German colonists into the eastern districts, and seeking to benefit the inhabitants of the towns.

In 1273 Rudolph, count of Habsburg, became German king, and his attention soon turned to Ottakar, whose power menaced the occupant of the German throne. Finding some support in Austria, Rudolph questioned the title of the duchies in 1275, and undertook to recover the imperial lands which had been in the possession of the emperor Frederick II. Ottakar was summoned twice before the diet, the imperial court declared against him, and in July 1275 he was placed under the ban. War was the result, and in November 1276 Ottakar submitted to Rudolph, and renounced the duchies of Austria, Styria and Carinthia. For some time the three duchies were administered by Rudolph in his capacity as head of the Empire, of which they formed part. Not content with this tie, however, which was personal to himself alone, the king planned to make them hereditary possessions of his family, and to transfer the headquarters of the Habsburgs from the Rhine to the Danube. Some opposition was offered to this scheme; but the perseverance of the king overcame all difficulties, and one of the most important events in European history took place on the 27th of December 1282, when Rudolph invested his sons, Rudolph and Albert, with the duchies of Austria and Styria. He retained Carinthia in his own hands until 1296, when, with the help of Meinhard IV., count of Tirol. The younger Rudolph took no part in the government of Austria and Styria, which was undertaken by Albert, until his election as German king in 1298. Albert appears to have been rather an arbitrary ruler. In 1288 he suppressed a rising of the people of Vienna, and he made the fullest use of the ducal power in asserting his real or supposed rights. At this time the principle of primogeniture was unknown in the house of Habsburg, and for many years the duchies were ruled in common by two, or even three, members of the family. After Albert became German king, his two elder sons, Rudolph and Frederick, were successively associated with him in the government, and after his death in 1308, his four younger sons shared at one time or another in the administration of Austria and Styria. In 1314 Albert's son, Frederick, was chosen German king in opposition to Louis IV., duke of Upper Bavaria, afterwards the emperor Louis IV., and Austria was weakened by the efforts of the Habsburgs to sustain Frederick in his contest with Louis, and also by the struggle carried on between another brother, Leopold, and the Swabians. A series of deaths among the Habsburgs during the first half of the 14th century left Duke Albert II., and his four sons as the only representatives of the family. Albert ruled the duchies alone from 1344 to 1356, and after this date his sons began to take part in the government. The most noteworthy of these was Duke Rudolph IV., a son-in-law of the emperor Charles IV., who showed his interest in learning by founding the university of Vienna in 1365. Rudolph's chief aim was to make Austria into an independent state, and he forged a series of privileges the purport of which was to free the duchy from all its duties towards the Empire. A sharp contest with the emperor followed this proceeding, and the Austrian duke, annoyed that
AUSTRIA-HUNGARY

Magyars and Slavs never willingly recognized a style which ignored their national rights and implied the superiority of the German elements of the monarchy; to the Germans it was a poor substitute for a title which had represented the political unity of the German race under the Holy Empire. For long after the Vienna Congress of 1814-1815 the “Kaiser” as such exercised a powerful influence over the imaginations of the German people outside the Habsburg dominions; but this was because the title was still surrounded with its ancient halo and the essential change was not at once recognized. The outcome of the long struggle with Prussia, which in 1866 finally broke the spell, and the proclamation of the German empire in 1871 left the title of emperor of Austria stripped of everything but a purely territorial significance. It had, moreover, by the compact with Hungary of 1867, ceased even fully to represent the relation of the emperor to all his dominions; and the title which had been devised to cover the whole of the Habsburg monarchy sank into the official style of the sovereign of but a half; while even within the Austrian empire proper it is resented by those peoples which, like the Bohemians, wish to obtain the same recognition of their national independence as was conceded to Hungary. Thus in the account of the origin and development of the Habsburg monarchy under this heading, it is merely for the sake of convenience. The first nucleus round which the present dominions of the house of Austria gradually accumulated was the mark which lay along the south bank of the Danube, east of the river Enns, founded about A.D. 800 as a defence for the Frankish kingdom against the Slavs. Although its total length from east to west was only about 60 m., it was associated in the popular mind with a large and almost unbroken tract of land in the east of Europe. This fact, together with the position of the mark with regard to Germany in general and to Bavaria in particular, accounts for the name Österreich (Austria), i.e. east empire or realm, a word first used in a charter of 966, where the phrase in regione vulgari nomine Ostarrichi occurs. The development of this small mark into the Austro-Hungarian monarchy was a slow and gradual process, and falls into two main divisions, which almost coincide with the periods during which the dynasties of Babenberg and Habsburg have respectively ruled the land. The energies of the house of Babenberg were chiefly spent in enlarging the area and strengthening the position of the mark itself, and when this was done the house of Habsburg set itself with remarkable perseverance and marvellous success to extend its rule over neighbouring territories. The many vicissitudes which have attended this development have not, however, altered the European position of Austria, which has remained the same for over a thousand years. Standing sentinel over the valley of the middle Danube, and barring the advance of the Slavs on Germany, Austria, whether mark, duchy or empire, has always been the meeting-place of the Teuton and the Slav. It is this fact which gives it a unique interest and importance in the history of Europe, and which unites the ideas of the Germans to-day with those of Charlemagne and Otto the Great.

The southern part of the country now called Austria was inhabited before the opening of the Christian era by the Taursici, a Celtic tribe, who were subsequently called the Norici, and who were conquered by the Romans about 20 B.C. Their land was afterwards included in the provinces of Pannonia and Noricum, and under Roman rule, Vindobona, the modern Vienna, became a place of some importance. The part of the country north of the Danube was peopled by the Marcomanni and the Quadi, and both of these tribes were frequently at war with the Romans, especially during the reign of the emperor Marcus Aurelius, who died at Vindobona in A.D. 180 when campaigning against them. Christianity and civilization obtained entrance into the land, but the increasing weakness of the Roman empire opened the country to the inroads of the barbarians, and during the period of the great migrations it was ravaged in quick succession by a number of these tribes, prominent among whom were the Huns. The lands on both banks of the river shared the same fate, due probably to the fact which Gibbon has drawn attention, that during this period the Danube was frequently frozen over. About 500 the district was settled by the Slovenes, or Corutanes, a Slavonic people, who formed part of the kingdom of Samo, and were afterwards included in the extensive kingdom of the Avars. The Franks claimed some authority over this people, and probably some of the princes of the Slovenes had recognized this claim, but it could not be regarded as serious while the Avars were in possession of the land. In 791 Charlemagne, after he had established his authority over the Bavariai or Bavarians, crossed the river Enns, and moved against the Avars. This attack was followed by campaigns on the part of his lieutenants, and in 805 the Avars were finally subdued, and their land incorporated with the Frankish empire. This step brought the later Austria definitely under the rule of the Franks, and during the struggle Charlemagne erected a mark, called the East Mark, to defend the eastern border of his empire. A series of margraves ruled this small district from 799 to 907, but as the Frankish empire grew weaker, the mark suffered more and more from the ravages of its eastern neighbours. During the 11th century, which saw the rise of the Babenberg family, the mark was overran by the Moravians, and then by the Magyars, or Hungarians, who destroyed the few remaining traces of Frankish influence.

A new era dawned after Otto the Great was elected German king in 936, and it is Otto rather than Charlemagne who must be regarded as the real founder of Austria. In August 955 he gained a great victory over the Magyars on the Lechfeld, freed Bavaria from their presence, and re-established the East Mark for the defence of his kingdom. In 976 his son, the emperor Otto II., entrusted the government of this mark, soon to be known as Austria, to Leopold, a member of the family of Babenberg (q.v.), and its administration was conducted with vigour and success. Leopold and his descendants ruled Austria until the extinction of the family in 1246, and by their skill and foresight raised the mark to an important place among the German states. Their first care was to push its eastern frontier down the Danube valley, by colonizing its eastern borders of the mark, and the success of this work may be observed in the growth of the cities of the Lower Danube, the raising of Tulln, and finally about 1140 to Vienna. The country as far as the Leitha was subsequently incorporated with Austria, and in the other direction the district between the Enns and the Inn was added to the mark in 1156, an important date in Austrian history. Anxious to restore peace to Germany in this year, the new king, Frederick I., raised Austria to the rank of a duchy, and conferred upon it exceptional privileges. The investiture was bestowed not only upon Duke Henry but upon his second wife, Theodora; in case of a failure of male heirs the duchy was to descend to females; and if the duchy had no children he could nominate his successor. Controlling all the jurisdiction of the land, the duke's only duties towards the Empire were to appear at any diet held in Bavaria, and to send a contingent to the imperial army for any campaigns in the countries bordering upon Austria. In 1186 Duke Leopold I. made a treaty with Ottakar IV., duke of styria, an arrangement which brought Styria and upper Austria to the Babenberg family, and in 1222, and in 1220 Duke Leopold II., purchased some lands from the bishop of Freising, and took the title of lord of Carniola. When the house of Babenberg became extinct in 1246, Austria, stretching from Passau almost to Pressburg, had the frontiers which it retains to-day, and this increase of territory had been accompanied by a corresponding increase in wealth and general prosperity. The chief reason for this prosperity was the growth of trade along the Danube, which stimulated the foundation, or the growth, of towns, and brought considerable riches to the ruler. Under the later Babenbergs Vienna was regarded as one of the most important of German cities, and it was computed that the duke was as rich as the archbishop of Cologne, or the margrave of Brandenburg, and was surpassed in this respect by only one German prince, the...
Austria was not raised to the dignity of an electorate by the Golden Bull of 1356, did not shrink from a contest with Charles. In 1361, however, he abandoned his pretensions, but approved the title of archduke (q.v.) and in 1364 declared that the possessions of the Habsburgs were indivisible. Meanwhile the acquisition of neighbouring territories had been steadily pressed on. In 1335 the duchy of Carinthia, and a part of Carniola, were inherited by Dukes Albert II. and Otto, and in 1363 Rudolph IV. obtained the county of Tirol. In 1364 Carniola was made into an hereditary duchy; in 1374 part of Istria came under the rule of the Habsburgs; in 1382 Trieste submitted voluntarily to Austria, and at various times during the century, other smaller districts were added to the lands of the Habsburgs.

Rudolph IV. died childless in 1365, and in 1370 his remaining brothers, Leopold III. and Albert III., made a division of their lands, by which Albert retained Austria proper and Carniola, and Leopold got Styria, Carinthia and Tirol. Leopold was killed in 1386 at the battle of Sempach, and Albert became guardian for his four nephews, who subsequently ruled their lands in common. The senior line which ruled in Austria was represented after the death of Duke Albert III. in 1395 by his son, Duke Albert IV., and then by his grandsons, Duke Frederick V. of Carinthia, and Duke Albert married Elizabeth, daughter of Sigismund, king of Hungary and Bohemia, and on the death of his father-in-law assumed these two crowns. He died in 1439, and just after his death a son was born to him, who was called Ladislaus Posthumus, and succeeded to the duchy of Austria and to the kingdoms of Hungary and Bohemia. William and Leopold, the two eldest sons of Duke Leopold III., and, with their younger brothers Ernest and Frederick, the joint rulers of Styria, Carinthia and Tirol, died early in the 15th century, and in 1436 Ernest and Frederick made a division of their lands. Ernest became duke of Styria and Carinthia, and Frederick, count of Tirol. Ernest was succeeded in 1424 by his sons, Frederick and Albert, and Frederick in 1439 by his son, Sigismund, and these three princes were reigning when King Albert II. died in 1439. Frederick, who succeeded Albert as German king, and was soon crowned emperor as Frederick III., acted as guardian for Sigismund of Tirol, who was a minor, and also became regent of Austria in consequence of the infirmity of Ladislaus. However, when Ladislaus died, and disorder, owing partly to the feebleness of his own character, partly to the wish of his brother, Albert, to share his dignities. The Tirolean soon grew weary of his government, and, in 1446, Sigismund was declared of age.

The estates of Austria were equally discontented and headed an open revolt, the object of which was to remove Ladislaus from Frederick's charge and deprive the latter of the regency. The leading spirit in this movement was Ulrich Eizing (Eitzing or von Eiczinger, d. before 1463), a low-born adventurer, ennobled by Albert II., in whose service he had accumulated vast wealth and power. In 1457 he organized an armed league, and in December, with the aid of the populace, made himself master of Vienna, whither he had summoned the estates. In March 1452 he was joined by Count Ulrich of Cilli, while the Hungarians and the powerful party of the great house of Rosenberg in Bohemia attached themselves to the league. Frederick, who had hurried back from Italy, was besieged in August in the Vienna Neustadt, and was forced to yield, first to Ladislaus, and then the latter, whose influence had meanwhile eclipsed that of Eizing. Ladislaus now ruled nominally himself, under the tutelage of Count Ulrich.

The country was, however, distracted by quarrels between the party of the high aristocracy, which recognized the count of Cilli as its chief, and that of the lesser nobles, citizens, and populace, who followed Eizing. In September 1453 the latter, by a successful bemühte, succeeded in ousting Count Ulrich, and remained in power till February 1455, when the count once more entered Vienna in triumph. Ulrich of Cilli was killed before Belgrade in November 1456; a year later Ladislaus himself died (November 1457). Meanwhile Styria and Carinthia were equally unfortunate under the rule of Frederick and Albert; and the death of Ladislaus led to still further complications. Austria, which had been solemnly created an archduchy by the emperor Frederick in 1453, was claimed by the three remaining Habsburg princes, and lower Austria was secured by Frederick, while Albert obtained upper Austria. Both princes were unpopular, and in 1462 Frederick was attacked by the inhabitants of Vienna; and was forced to surrender lower Austria to Albert, whose spendthrift habits soon made his rule disliked. A further struggle between the brothers was prevented by Albert's death in 1463, when the estates did homage to Frederick. The emperor was soon again at issue with the Austrian nobles, and was attacked by Matthias Corvinus, king of Hungary, who drove him from Vienna in 1485. Although hemmed in by the inroads of the Turks, Matthias pressed on, and by 1487 was firmly in possession of Austria, Styria and Carinthia, which seemed quite lost to the Habsburgs.

The decline in the fortunes of the family, however, was to be arrested by Frederick's son, Maximilian, afterwards the emperor Maximilian I., who was the second founder of the greatness of the house of Habsburg. Like his father, Austria, and, in 1486, Maximilian attacked the Hungarians, and in 1490 he had driven them from Austria, and recovered his hereditary lands. In the same year he made an arrangement with his kinsman, Sigismund of Tirol, by which he brought this country under his rule, and when the emperor Frederick died in 1493, Maximilian united the whole of the Austrian lands under his sway. Continuing his acquisitions of territory, he inherited the possessions of the counts of Görz in 1500, added some districts to Tirol by intervening in a succession war in Bavaria, and acquired Gradisca in 1512 as the result of a struggle with Venice. He did much for the better government of the Austrian duchies. Bodies were established for executive, financial and judicial purposes, the Austrian lands constituted one of the imperial circles which were established in 1512, and in 1548 representatives of the Austrian lands were permitted to proceed, in the name of the emperor, to make war on the Turks. In these ways Maximilian proved himself a capable and energetic ruler, although his plans for making Austria into a kingdom, or an electorate, were abortive.

At the close of the middle ages the area of Austria had increased to nearly 50,000 sq. m., but its internal condition does not appear to have improved in proportion to this increase in size. The rulers of Austria lacked the prestige which attached to the electoral office, and, although five of them had held the position of German king, the four who preceded Maximilian had added little or nothing to the power and dignity of this position. The ecclesiastical organization of Austria was imperfect, so long as there was no archbishopric within its borders, and its clergy owed allegiance to foreign prelates. The work of unification which was so successfully accomplished by Maximilian was aided by two events, the progress of the Turks in south-eastern Europe, and the loss of most of the Habsburg possessions on the Rhine, which ended in 1555 the separate existence of the separate states of Austria, and the second turned the attention of the Habsburgs to the possibilities of expansion in eastern Europe.

(A. W. H.)
and Hungary. Austria and Spain were thus divided, and, in spite of the efforts of the archduke Charles in the Spanish Succession War, were never again united, for at the battle of Mohács, on the 28th of August 1526, Suleiman the Magnificent defeated and killed Louis, king of Bohemia and of Hungary, whose sister Anne had married Ferdinand. By this victory the Turks conquered and retained, till the peace of Karlowitz in 1699, the greater part of Hungary. During most of his life Ferdinand was engaged in combating the Turks and in attempting to secure Hungary. In John Zápolya, who was supported by Suleiman, Ferdinand found an active rival. The Turks besieged Vienna in 1530 and made several invasions of Hungary and Austria. At length Ferdinand agreed to pay Suleiman an annual tribute for the small portion—about 12,228 sq. m.—of Hungary which he held. During Charles V.'s struggles with the German Protestants, Ferdinand preserved a neutral attitude, which contributed to gain Germany a short period of internal peace. Though Ferdinand himself did not take a leading part in German religious or foreign politics, the period was one of intense interest to Austria. Throughout the years from 1530 to 1648 there are, said Stubbs, two distinct ideas in progress which may be regarded as attempts to unite the whole of the Empire, a unity in the short period. The Reformation is one, the claims of the House of Austria is the other. Austria did not benefit from the reign of Charles V. The emperor was too much absorbed in the affairs of the rest of his vast dominions, notably those of the Empire, rent in two by religious differences and the secular ambitions for which those were the excuse, to give any effective attention to its needs. The peace of Augsburg, 1555, which recognized a dualism within the Empire in religion as in politics, marked the failure of his plan of union (see CHARLES V.; GERMANY; MAURICE OF SAXONY); and meanwhile he had been able to accomplish nothing to rescue Hungary from the Turkish yoke. It was left for his brother Ferdinand, a ruler of consummate wisdom (1556-1592) "to establish the modern Habsburg-Austrian empire with its exclusive territorial interests, its administrative experiments, its intricacies of religion and of race."

Before his death Ferdinand divided the inheritance of the German Habsburgs between his three sons. Austria proper was left to his eldest son Maximilian, Tirol to the archduke Ferdinand; and Styria with Carinthia and Carniola to the archduke Charles. Under the emperor Maximilian II. (1564-1576), who was also king of Bohemia and Hungary, a liberal policy preserved peace, but he was unable to free his government from its humiliating position of a tributary to the Turk, and he could do nothing to found religious liberty within his dominions on a permanent basis. The whole of Austria and nearly the whole of Styria were mainly Lutheran; in Bohemia, Silesia and Moravia, various forms of Christian belief struggled for mastery; and Catholicism was almost confined to the mountains of Tirol. The accession of Rudolph II. (1576-1612), a fanatical Spanish Catholic, changed the situation entirely. Under him the Jesuits were encouraged to press on the counter-Reformation. In the early part of his reign there was hardly any government at all. In Bohemia a state of semi-independence existed, while Hungary preferred the Turk to the emperor. In both kingdoms he had failed to assert his sovereign power except in fitful attempts to extirpate heresy. With anarchy prevalent within the Austrian dominions some action became necessary. Accordingly in 1606 the archdukes made a compact agreeing to acknowledge the archduke Matthias as head of the family. This arrangement proved far from successful. Matthias, who was emperor from 1612 to 1619, proved unable to restore order, and when he died Bohemia was practically independent. His successor Ferdinand II. (1619-1637) was strong of will; and resolved to win back Germany to the Catholic faith. As archduke of Styria he had crushed out Protestantism in that duchy, and having been elected king of Bohemia in 1618

1 Rudolph V. as archduke of Austria, II. as emperor.

was resolved to establish there the rule of the Jesuits. His attempt to do so led to the outbreak of the Thirty Years' War (see BOHEMIA; THIRTY YEARS' WAR). Till 1620 the fortunes of Austria brightened under the active rule of Ferdinand, who was assisted by Maximilian of Bavaria and the Catholic League, and by Wallenstein. The Palatinate was conquered, the Danish king was overthrown, and it seemed that Austria would establish its predominance over the whole of Germany, and that the Baltic would become an Austrian lake. The fortunes of Austria never seemed brighter than in 1628 when Wallenstein began the siege of Stralsund. His failure, followed by the arrival of Gustavus Adolphus in Germany in 1630, proved the death blow of Austrian hopes. In 1632 Gustavus Adolphus was killed, in 1634 Wallenstein was assassinated, and in 1635 France entered into the war. The Thirty Years' War now ceased to be a religious struggle between Catholicism and Protestantism; it resolved itself into a return to the old political strife between France and the Habsburgs. Till 1648 the Bourbon and Habsburg powers continued the war, and at the peace of Westphalia, 1648, Ferdinand III. (1637-1657) was forced to yield Alsace to France, to grant territorial supremacy, including the right of making alliances, to the states of the Empire, and to acknowledge the concurrent jurisdiction of the imperial chamber and the Aulic council. The disintegration of the Holy Roman Empire was now practically accomplished, and though the possession of the imperial dignity continued to give the rulers of Austria prestige, the Habsburgs henceforward devoted themselves to their Austrian interests rather than to those of the Empire.

In 1657 Leopold I., who had already ruled the Austrian dominions for two years, succeeded his father Ferdinand and was crowned emperor in the following year. His long reign of 48 years was of great importance for Austria, as determining both the internal character and the external policy of the monarchy. The long struggle with France to which the ambitions of Louis XIV. gave rise, and which culminated in the War of Spanish Succession, belongs less to the history of Austria proper than to that of Germany and of Europe. Of more importance to Austria itself was the war with Sweden (1657-60) which resulted in the peace of Oliva, by which the independence of Poland was secured and the frontier of Hungary safeguarded, and the campaigns against the Turks (1662-64 and 1683-99), by which the Ottoman power was driven from Hungary, and the Austrian attitude towards Turkey and the Slav peoples of the Balkans determined for a century to come. The first war, due to Ottoman aggression in Transylvania, ended with Montecuculi's victory over the grand vizier at St Gothard on the Raab on the 1st of August 1664. The general political situation prevented Leopold from taking full advantage of this, and the peace of Vasvár (August 10) left the Turks in possession of Nagyvarad (Grosswardein) and the fortress of Ersekújvár (Neuhäusel), Transylvania being recognized as an independent principality. The next Turkish war was the direct outcome of Leopold's policy in Hungary, where the persecution of the Protestants and the suppression of the constitution in 1658, led to a widespread conspiracy. This was more especially suppressed; and though afterwards a period of arbitrary government (1672-1679), the patinate and the constitution, with certain concessions to the Protestants, were restored, the discontent continued. In 1683, invited by Hungarian malcontents and spurred on by Louis XIV., the Turks burst into Hungary, overran the country and appeared before the walls of Vienna. The victory of the 12th of September, gained over the Turks by John Sobieski (see JOHN III. SÖBIESKI, KING OF POLAND) not only saved the Austrian capital, but was the first of a series of successes which drove the Turks permanently beyond the Danube, and established the power of Austria in the East. The victories of Charles of Lorraine at Pártkány (1683) and Esztergom (Gran) (1685) were followed by the capture of Budapest (1686) and the defeat of the Ottomans at
AUSTRIA-HUNGARY

Mohács (1688). In 1688 the elector took Belgrade; in 1691 Louis William I. of Baden won the battle of Sanklament, and, on the 1st of September 1697 Prince Eugene gained the crowning victory of Zenta. This was followed, on the 26th of January 1699, by the peace of Karlowitz, by which Slavonia, Transylvania and all Hungary, except the banat of Temesvár, were ceded to the Austrian crown. Leopold had wisely decided to initiate a conciliatory policy in Hungary. At the diet of Pressburg (1687–1688) the Hungarian crown had been made hereditary in the house of Habsburg, and the crown prince Joseph had been crowned hereditary king of Hungary (q.v.). In 1697 Transylvania was united to the Hungarian monarchy. A further fact of great prospective importance was the immigration, after an abortive rising against the Turks, of some 30,000 Slav and Albanian families into Slavonia and southern Hungary, where they were granted by the emperor Leopold a certain autonomy and the recognition of the Orthodox religion.

By the conquest of Hungary and Transylvania Leopold completed the edifice of the Austrian monarchy, of which the foundations had been laid by Ferdinand I. in 1526. He had also done much for its internal consolidation. By the death of the archduke Sigismund in 1665 he not only gained Tirol, but a considerable sum of money, which he used to buy back the Silesian principalities of Oppeln and Ratibor, pledged by Ferdinand III. to the Poles. In the administration of his dominions, too, Leopold succeeded in strengthening the authority of the central government. The old estates, indeed, survived; but the emperor kept the effective power in his own hands, and to his reign are traceable the first beginnings of that system of centralized bureaucracy which was established under Maria Theresa and survived, for better or for worse, till the revolution of 1848. It was under Leopold, also, that the Austrian standing army was established in spite of much opposition; the regiments raised in 1672 were never disband. For the intellectual life of the country Leopold did much. In spite of his intolerant attitude towards religious dissent, he proved himself an enlightened patron of learning. He helped in the establishment of the universities of Innsbruck and Olmütz; and under his auspices, after the defeat of the Turks in 1683, Vienna began to develop from a mere frontier fortress into one of the most brilliant capitals of Europe. (See Leopold I.)

Leopold died in 1705 during the war of Spanish Succession (1702–13), which he left as an evil inheritance to his sons Joseph I. (d. 1711) and Charles VI. The result of the war was a further aggrandizement of the house of Austria; but not to the extent that had been hoped. Apart from the fact that British and Austrian troops had been unable to deprive Philip V. of his throne, it was from the point of view of Europe at large by no means desirable that Charles VI. should succeed in reviving the empire of Charles V. By the treaty of Utrecht, accordingly, Spain was left to the House of Bourbon, while that of Austria received the Spanish Netherlands, Sardinia and Naples.

The treaty of Karlowitz, and the settlement of 1713–1714, marked a new starting-point in the history of Austria. The efforts of Turkey to regain her ascendancy in eastern Europe at the expense of the Habsburgs had resulted in failure, and henceforward Turkish efforts were confined to resisting the steady development of Austria in the direction of Constantinople. The treaties of Utrecht, Rastadt and Baden had also re-established and strengthened the position of the Austrian monarchy in western Europe. The days of French invasions of Germany had for the time ceased, and revenge for the attacks made by Louis XIV. was found in the establishment of Austrian supremacy in Italy and in the substitution of Austrian for Spanish dominion in the Netherlands.

The situation, though apparently favourable, was full of difficulty, and only a statesman of uncommon dexterity could have guided Austria with success through the ensuing years. Composed of a congeries of nationalities which included Czechs, Magyars, Ruthenians, Rumanians, Germans, Italians, Flemings and other races, and with territories separated by many miles, the Habsburg dominions required from their ruler patience, tolerance, administrative skill and a full knowledge of the currents of European diplomacy. Charles VI. possessed none of these qualities; and when he died in 1740, the weakness of the scattered Habsburg empire rendered it an object of the cupidities of the continental powers. Yet, though the War of Spanish Succession had proved a heavy drain on the resources of the hereditary dominions of the Austrian crown, Charles VI. had done much to compensate for this by the successes of his arms in eastern Europe. In 1716, in alliance with Venice, he declared war on the Turks; Eugene's victory at Peterwardein involved the conquest of the banat of Temesvár, and was followed in 1717 by the capture of Belgrade. By the treaty signed at Passarowitz on the 21st of July 1718, the banat, which rounded off Hungary and Belgrade, with the northern districts of Servia, were annexed to the Habsburg monarchy.

Important as these gains were, the treaty none the less once more illustrated the perpetual sacrifice of the true interests of the hereditary dominions of Austria to the exigencies of the Habsburg to its European entanglements. Had the war continued, the Turks would undoubtedly have extended her conquests down the Danube. But Charles was anxious about Italy, then in danger from Spain, which under Alberoni's guidance had occupied Sardinia and Sicily. On the 2nd of August 1718, accordingly, Charles joined the Triple Alliance, henceforth the Quadruple Alliance. The coercion of Spain resulted in a peace by which Charles obtained Sicily in exchange for Sardinia. The shifting of the balance of power that followed belongs to the history of Europe (q.v.); for Austria the only important outcome was that in 1731 Charles found himself isolated. Being without a son, he was now anxious to secure the throne for his daughter Maria Theresa, in accordance with the Pragmatic Sanction of the 19th of April 1713, in which he had pronounced the indivisibility of the monarchy, and had settled the succession on his daughter, in default of a male heir. It now became his object to secure the adhesion of the powers to this instrument. In 1731 Great Britain and Holland agreed to respect it, in return for the cession of Parma, Piacenza and Guastalla to Don Carlos; but the hostility of the Bourbon powers continued, resulting in 1733 in the War of Polish Succession, the outcome of which was the acquisition of Lorraine by France, and of Naples, Sicily and the Tuscan ports by Don Carlos, while the power of the Habsburg monarchy in northern Italy was strengthened by the acquisition of Parma, Piacenza and Guastalla. At the same time Spain and Sardinia adhered to the Pragmatic Sanction. Francis, the dispossessed duke of Lorraine, was to be compensated with Tuscany. On the 12th of February 1736 he was married to the archduchess Maria Theresa, and on the 11th of May following he signed the formal act ceding Lorraine to France.

The last years of Charles VI. were embittered by the disastrous outcome of the war with Turkey (1735–1739), on which he had felt compelled to embark in accordance with the terms of a treaty of alliance with Russia signed in 1735. After a campaign of varying fortunes the Turks beat their imperial troops at Krotzka on the 23rd of July 1739 and laid siege to Belgrade, where on the 1st of September a treaty was signed, which, with the exception of the banat, surrendered everything that Austria had gained by the treaty of Passarowitz. On the 20th of October 1740, Charles died, leaving his dominions in no condition to resist the attacks of the powers, which, in spite of having adhered to the Pragmatic Sanction, now sought to profit from their weakness. Yet for their internal development Charles had done much. His religious attitude was moderate and tolerant, and he did his best to promote the enlightenment of his subjects. He was zealous, too, for the promotion of trade and industry, and, besides the East India Company which he established at Ostend, he encouraged the development of Trieste and Flume as sea-ports and centres of trade with the Levant.
The accession of Maria Theresa to the throne of the Habsburgs marks an important epoch in the history of Austria. For a while, indeed, it seemed that the monarchy would survive the dissolution of the Holy Roman Empire. The 18th century witnessed the breach of a solemn compact was lightly regarded; and Charles VI. had neglected the advice of Prince Eugene to leave an effective army of 200,000 men as a more solid guarantee of the Pragmatic Sanction than the signatures of the powers. As it was, the Austrian forces, disorganized in the long confusion of the Turkish wars, were in no condition to withstand Frederick the Great, when in 1740, at the head of the splendid army bequeathed to him by his father, he invaded Silesia (see Austrian Succession, War 02). The Prussian victory at Mollwitz (April 10, 1741) brought into the field against Austria all the powers which were ambitious of expansion at her expense: France, Bavaria, Spain, Saxony and Sardinia. Nor was the peril wholly external. Apart from the perennial discontent of the Magyars and Slavs, the confusion and corruption of the administration, and the misery caused by the ruin of the finances, had made the Habsburg dynasty unpopular even in its German states, and in Vienna itself a large section of public opinion was loudly in favour of the claims of Charles of Bavaria. Yet the war, if it revealed the weakness of the Austrian monarchy, revealed also unexpected sources of strength. Not the least of these was the character of Maria Theresa herself, who to the fascination of a young and beautiful woman added a very masculine quality of self-discipline and the heart's approval, and to her wise and timely concessions, the Hungarians had rallied to her support, and for the first time in history Austria awoke not only to a feeling of enthusiastic loyalty to a Habsburg monarch, but also to the realization that their true interests were bound up with those of Austria (see Hungary: History). Although, then, as the result of the war, Silesia was by the treaty of Dresden transferred from Austria to Prussia, while in Italy by the treaty of Aix-la-Chapelle in 1748, cessions were made at the expense of the house of Habsburg to the Spanish Don Philip and to Sardinia, the Austrian monarchy as a whole had displayed a virility that had astonished the world, and was in some respects stronger than at the beginning of the struggle, notably in the great improvement in the army and in the possession of generals schooled by the experience of active service.

The period from 1747 to 1756, the year of the outbreak of the Seven Years' War, was occupied in preparations for carrying into effect the determination of Maria Theresa to recover the lost provinces. To give any chance of success, it was recognized that a twofold change of system was necessary: in internal and in external affairs. To strengthen the internal a complete revolution of its administration was begun under the auspices of Count F. W. Haugwitz (1700-1765); the motley system which had survived from the middle ages was gradually replaced by an administrative machinery uniformly organized and centralized; and the army especially, hitherto patched together from the quotas raised and maintained by the various diets and provincial estates, was withdrawn from their interference. These reforms were practically confined to the central provinces of the monarchy; for in Hungary, as well as in the outlying territories of Lombardy and the Netherlands, it was recognized that the conservative temper of the peoples made any revolutionary change in the traditional system inadvisable.

Meanwhile, in foreign affairs, it had become clear that for Austria the enemy to be dreaded was no longer France, but Prussia, and Kaunitz prepared the way for a diplomatic revolution, which took effect when, on the 1st of May 1756, Austria and France concluded the first treaty of Versailles. The long rivalry between Bourbons and Habsburgs was thus ended, and France and Austria remained in alliance or at peace until the outbreak of the French Revolution. So far as Austria was concerned, the Seven Years' War (q.v.) in which France and Austria were ranged against Prussia and Great Britain, was an attempt on the part of Maria Theresa to recover Silesia. It failed; and the peace of Hubertshburg, signed on the 15th of February 1763, left Germany divided between Austria and Prussia, whose rivalry for the hegemony was to last until the victory of Königgrätz (1866) definitely decided the issue in favour of the Hohenzollern monarchy. With the dissolution of Silesia, a large part of the Habsburg empire was lost to France, with which Maria Theresa was left to look for "compensation" elsewhere. The most obvious direction in which this could be sought was in Bavaria, ruled by the decadent house of Wittelsbach, the secular rival of the house of Habsburg in southern Germany. The question of the annexation of Bavaria by conquest or exchange had occupied the minds of Austrian statesmen throughout the century: it would not only have removed a perpetual menace to the peace of Austria, but would have given to the Habsburg monarchy an overwhelming strength in South Germany. The matter came to an issue in 1777, on the death of the elector Maximilian III. The heir was the elector palatine Charles Theodore, but Joseph II., who had been elected emperor in 1765, in succession to his father, and appointed co-regent with his mother—claimed the inheritance, and prepared to assert his claims by force. The result was the so-called War of Bavarian Succession. As a matter of fact, however, though the armies under Frederick and Joseph were face to face in the field, the affair was settled without actual fighting; Maria Theresa, fearing the chances of another struggle with Prussia, overruled her son at the last moment, and by the treaty of Teschen agreed to be content with the cession of the Quarter of the Inn (Innviertel) and some other districts.

Maria Theresa was the widow of the late elector of Bavaria, by whom she had received the crown of the Habsburgs, and the war with Turkey, by which the empire of the sultans was advanced to the Black Sea and threatened to establish itself south of the Danube, were productive of consequences of enormous importance to Austria in the East. Russian control of the Danube was a far more serious menace to Austria than the neighbourhood of the decadent Ottoman power; and for a while the policy of Austria towards the Porte underwent a change that foreshadowed her attitude towards the Eastern Question in the 19th century. In spite of the reluctance of Maria Theresa, Kaunitz, in July 1771, concluded a defensive alliance with the Porte. He would have exchanged this for an active co-operation with Turkey, could Frederick the Great have been persuaded to promise at least neutrality in the event of a Russo-Austrian War. But Frederick was unwilling to break with Russia, with whom he was negotiating the partition of Poland; Austria in these circumstances dared not take the offensive; and Maria Theresa was compelled to purchase the modification of the extreme claims of Russia in Turkey by agreeing to, and sharing in, the spoliation of Poland. Her own share of the spoils was the acquisition, by the first treaty of partition (August 5, 1772), of Galicia and Lodomeria. Turkey was left in the lurch; and Austrian troops even occupied portions of Moldavia, in order to secure the communication between the new Polish provinces and Transylvania. At Constantinople, too, Austria once more supported Russian policy, and was rewarded, in 1777, by the acquisition of Bukovina from Turkey. In Italy the influence of the House of Austria had been strengthened by the marriage of the archduke Ferdinand with the heiress of the d'Estes of Modena, and the establishment of the archduke Leopold in the grand-duchy of Tuscany.

In internal affairs Maria Theresa may be regarded as the practical founder of the united Austrian state. The new system of centralization has already been referred to. It only remains to add that, in carrying out this system, Maria Theresa was too wise to fall into the errors afterwards made by her son and successor. She was no doctrinaire, and consistently acted on the principle once laid down by Machiaveli, that while changing the substance, the prince should be careful to preserve the form of old institutions. Alongside the new bureaucracy, the old estates survived in somnolent inactivity, and even in Hungary, though the ancient constitution was left untouched, the diet was only summoned four times during the reign, and reforms were carried out, without protest, by royal ordinance. It was under Maria Theresa, too,
that the attempt was first made to make German the official language of the whole monarchy; an attempt which was partly successful even in Hungary, especially so far as the army was concerned, though Latin remained the official tongue of the diet, the county-assemblies and the courts.

The social, religious and educational reforms of Maria Theresa also mark her reign as the true epoch of transition from medieval to modern conditions in Austria. In religious matters the empress, though a devout Catholic and herself devoted to the Holy See, was carried away by the prevailing reaction, in which her ministers shared, against the pretensions of the papacy. The anti-papal tendency, known as Febronianism (q.v.), had made immense headway, not only among the laity but among the clergy in the Austrian dominions. By a new law, papal bulls could not be published without the consent of the crown, and the direct intercourse of the bishops with Rome was forbidden; the privileges of the religious orders were curtailed; and the education of the clergy was brought under state control. It was, however, only with reluctance that Maria Theresa agreed to carry out the papal bull suppressing the Society of Jesus; and, while declaring herself against persecution, she could never be persuaded to accept the views of Kaunitz and Joseph in favour of toleration. Parallel with the assertion of the rights of the state as against the church, was the revolution effected in the ecclesiastical system of the monarchy. This, too, was taken from the control of the church; the universities were remodelled and modernized by the introduction of new faculties, the study of ecclesiastical law being transferred from that of theology to that of jurisprudence, and the elaborate system of elementary and secondary education was established, which survived with slight modification till 1869.

The death of Maria Theresa in 1780 left Joseph II. free to attempt the drastic revolution from above, which had been restrained by the wise statesmanship of his mother. He was himself a strange incarnation at once of doctrinaire liberalism and the old Habsburg autocracy. Of the essential conditions of his empire he was constitutionally unable to form a conception. He was a disciple, not of Machiavelli, but of Rousseau; and his scattered dominions, divided by innumerable divergences of racial and class prejudice, and encumbered with traditional institutions to which the people clung with passionate conservatism, he regarded as so much vacant territory on which to build up his ideal state. He was, in fact, a Revolutionist who happened also to be a Habsburg emperor. "Reason" and "enlightened philosophy" were his watchwords; opposition to his wise measures he regarded as obscurantist and unreasonable, and unreason, if it proved stubborn, as a vice to be corrected with whips. In this spirit he at once set to work to reconstruct the state, on lines that strangely anticipated the principles of the Constituent Assembly of 1789. He refused to be crowned or to take the oath of the local constitutions, and divided the whole monarchy into thirteen departments, to be governed under a uniform system. In ecclesiastical matters his policy was also that of "reform from above," the complete subordination of the clergy to the state, and the severance of all effective ties with Rome. This treatment of the "Fakirs and Ulama" (as he called them in his letters), who formed the most powerful element in the monarchy, would alone have ensured the failure of his plans, but failure was made certain by the introduction of the conscription, which turned even the peasants, whom he had done much to emancipate, against him. The threatened revolt of Hungary, and the actual revolt of Tirol and of the Netherlands (see Belgium: History) together with the disasters of the war with Turkey, forced him, before he died, to the formal reversal of the whole policy of reform.

In his foreign policy Joseph II. had been scarcely less unhappy. In 1784 he had resumed his plan of acquiring Bavaria for Austria by negotiating with the elector Charles Theodore its exchange for the Netherlands, which were to be erected for his benefit into a "Kingdom of Burgundy." The elector was not unwilling, but the scheme was wrecked by the opposition of the heir to the Bavarian throne, the duke of Zweibrücken, in response to whose appeal Frederick the Great formed, on the 23rd of July 1785, a confederation of German princes (Fürstenbund) for the purpose of opposing the threatened preponderance of Austria. Prussia was thus, for the first time formally recognized as the protector of the German states against Austrian ambition, and had at the same time become the centre of an anti-Austrian alliance, which embraced Sweden, Poland and the maritime powers. In these circumstances the war with Turkey, on which Joseph embarked, in alliance with Russia, in 1788, would hardly have been justified by the most brilliant success. The first campaign, however, which he conducted in person was a dismal failure; the Turks followed the Austrian army, disorganized by disease, across the Danube, and though the transference of the command to the veteran marshal Loudon somewhat retrieved the initial disasters, his successes were more than counterbalanced by the alliance, concluded on the 31st of January 1790, between Prussia and Turkey. Three weeks later, on the 20th of February 1790, Joseph died broken-hearted.

The situation needed all the statesmanship of the new ruler, Leopold II. This was less obvious in his domestic than in his foreign policy, though perhaps equally present. As grand-duke of Tuscany Leopold had won the reputation of idealism and of a passionate love of liberty; and these qualities as "Josephinism" had not been justified by its results, and the progress of the Revolution in France was beginning to scare even enlightened princes into reaction. Leopold, then, reverted to the traditional Habsburg methods; the old supremacy of the Church, regarded as the one effective bond of empire, was restored; and the Einheitstaat was once more resolved into its elements, with the old machinery of diets and estates, and the old abuses. It was the beginning of that policy of "stability" associated later with Metternich, which was to last till the cataclysm of 1848. For the time, the policy was justified by its results. The spirit of revolutionary France had not yet touched the heart of the Habsburg empire, and national rivalries were expressed, not so much in expansive ambitions, as in a somnolent clinging to traditional privileges. Leopold, therefore, who made his début on the European stage as the executor of the ban of the Empire against the insurgent Liégeois, was free to pose as the champion of order against the Revolution, without needing to fear the resentment of his subjects. He played this rôle with consummate skill in the negotiations that led up to the treaty of Reichenbach (August 15, 1790), which ended the war between Prussia and Austria, and paved the way for Guevgo with Turkey (September 10). Leopold was now free to deal with the Low Countries, which were reduced to order before the end of the year. On the 4th of August 1791, was signed at Sistova the definitive peace with Turkey, which practically established the status quo.

On the 6th of October 1790, Leopold had been crowned Roman emperor at Frankfort, and it was as emperor, not as Habsburg, that he first found himself in direct antagonism to the France of the Revolution. The fact that Leopold's sister, Marie Antoinette, was the wife of Louis XVI. had done little to cement the Franco-Austrian alliance, which since 1763 had been practically non-existent; nor was it now the mainspring of his attitude towards revolutionary France. But by the decree of the 4th of August, which in the general abolishment of feudal rights involved the possessions of many German princes enclaves in Alsace and Lorraine, the Constituent Assembly had made the first move in the war against the established European system. Leopold protested as sovereign of Germany; and the protest was soon enlarged into one made in the name of Europe. The circular letter of Count Kaunitz, dated the 6th of July 1791, calling on the sovereigns to unite against the Revolution, was at once the beginning of the Concert of Europe, and in a sense the last manifesto of the Holy Roman Empire as "the centre of political unity." But the common policy proclaimed in the famous declaration of Pillnitz (August 27), was soon wrecked upon the particular interests of the powers. Both Austria and Prussia
were much occupied with the Polish question, and to have plunged into a crusade against France would have been to have left Poland, where the new constitution had been proclaimed on the 3d of May, to the mercy of Russia. Towards the second half of events in France, therefore, Leopold assumed at first a studiously moderate attitude; but his refusal to respond to the demand of the French government for the dispersal of the corps of émigrés assembled under the protection of the German princes on the frontier of France, and the insistence on the rights of princes dispossessed in Alsace and Lorraine, precipitated the crisis. On the 25th of January 1792 the French Assembly adopted the decree declaring that, in the event of no satisfactory reply having been received from the emperor by the 1st of March, war should be declared. On the 7th of February Austria and Prussia signed at Berlin an offensive and defensive treaty of alliance. This was ushered in the series of stupendous events which were to change the face of Europe and profoundly to affect the destinies of Austria. Leopold himself did not live to see the beginning of the struggle; he died on the 1st of March 1792, the day fixed by the Legislative Assembly as that on which the question of peace or war was to be decided.

The events of the period that followed, in which Austria necessarily played a conspicuous part, are dealt with elsewhere (see EUROPE - FREEDOM OF PRUSSIAN WARS - NAPOLEONIC CAMPAIGNS). Here it will only be necessary to mention those which form permanent landmarks in the progressive consolidation of the Austrian monarchy. Such was the second partition of Poland (January 23, 1793), which eliminated the “buffer state” on which Austrian statesmanship had hitherto laid such importance, and brought the Austrian and Russian frontiers into contact. Such, too, was the treaty of Campo Formio (October 17, 1797) which ended the first revolutionary war. By this treaty the loss of the Belgian provinces was confirmed, and though Austria gained Venice, the establishment of French preponderance in the rest of Italy made a breach in the tradition of Habsburg supremacy in the peninsula, which was to have its full effect only in the struggles of the next century. The rise of Napoleon, and his masterful interference in Germany, produced a complete and permanent revolution in the relations of Austria to the German states. The campaigns which issued in the treaty of Lunéville (February 9, 1801) practically sealed the fate of the old Empire. Even the venerable name to the present of the Habsburg house was lost in the years that followed. Francis II. determined to forestall the possible indignity of the subordination of his family to an upstart dynasty. On the 14th of May 1804, Napoleon was proclaimed emperor of the French; on the 11th of August Francis II. assumed the style of Francis I., hereditary emperor of Austria. Two years later, when the defeat of Austerlitz had led to the treaty of Pressburg (January 1, 1806), by which Austria lost Venice and Tirol, and Napoleon's Confederation of the Rhine had broken the unity of Germany, Francis formally abdicated the title and functions of Holy Roman emperor (August 6, 1806).

Austria had to undergo further losses and humiliations, notably by the treaty of Vienna (1809), before the outcome of Napoleon's Russian campaign in 1812 gave her the opportunity for recuperation and revenge. The skillful diplomacy of Metternich, who was now at the head of the Austrian government, enabled Austria to take full advantage of the situation created by the disaster to Napoleon in Russia. Gradually, Austria commenced to press on Russia her claims to the Eastern provinces and other outlying territories in western Germany, and by acquiring in the establishment of Prussia in the Rhine provinces, she abdicated to Prussia her position as the bulwark of Germany against France, and hastened the process of her own gravitation towards the Slavonic East to which the final impetus was given in 1866.

In order to understand the foreign policy of Austria, inseparably associated with the name of Metternich, during the period from the close of the congress of Vienna to the outbreak of the revolutions of 1848, it is necessary to know something of the internal conditions of the monarchy before and during this time. In 1792 Leopold II. had been succeeded by his son Francis II. His popular designation of "our good Kaiser Franz" this monarch owed to a certain simplicity of address and bonhommie which pleased the Viennese, certainly not to his serious qualities as a ruler. He shared to the full the autocratic temper of the Habsburgs, their narrow-mindedness and their religious and intellectual obscurantism; and the qualities which would have been estimable in a private family, and an excellent head clerk, were hardly those required by the conditions of the Austrian monarchy during a singularly critical period of its history.

The personal character of the emperor, moreover, gained a special importance owing to the modifications that were made in the administrative system of the empire. This had been originally organized in a series of departments: Aulic chanceries for Austria, for Hungary and Transylvania, a general Aulic chamber for finance, domains, mines, trade, post, &c., an Aulic council...
of war, a general directory of accounts, and a chancrey of the household, court and state. The heads of all these departments had the rank of secretaries of state and met in council under the royal presidency. In course of time, however, this body became too unwieldy for an effective cabinet, and Maria Theresa established the council of state. During the early years of the reign of Francis, the emperor kept himself in touch with the various departments by means of a cabinet minister; but he had a passion for detail, and after 1805 he himself undertook the function of keeping the administration together. At the same time he had no personal contact with ministers, who might communicate with him only in writing, and for months together never met for the discussion of business. The council of state was, moreover, itself soon enlarged and subdivided; and in course of time the emperor alone represented any synthesis of the various departments of the administration. The jurisdiction of the heads of departments, moreover, was strictly defined, and all that lay outside this was reserved for the imperial discretion. Whatever was covered by established precedent could be settled by the department at once; but matters falling outside such precedent, however insignificant, had to be referred to the throne. A system so inelastic, and so deadening to all initiative, could have but one result. Gradually the officials, high and low, subjected to an elaborate system of checks, refused to take any responsibility whatever; and the minutest administrative questions were handed up, through all the stages of the bureaucratic hierarchy, to be shelved and forgotten in the imperial cabinet. For Francis could not possibly himself deal with all the questions of detail arising in his vast empire, even had he desired to do so. In fact, his attitude towards all troublesome problems was summed up in his favourite phrase, "Let us sleep upon it"; questions unanswered would answer themselves.

The result was the gradual atrophy of the whole administrative machinery. The Austrian government was not consciously tyrannical, even in Italy; and Francis himself, though determined to be absolute, intended also to be paternal. Nor would the cruelties inflicted on the bolder spirits who dared to preach reform, which made the Austrian government a by-word among the nations, alone have excited the passionate spirit of revolt which carried all before it in 1848. The cause of this is to be sought rather in the daily friction of a system which had ceased to be efficient and only succeeded in irritating the public opinion it was powerless to curb.

Metternich himself was fully conscious of the evil. He recognized that the fault of the government lay in the fact that it did not govern, and he depledged that his own function, in a decadent age, was to prop up gasping institutions. He was far from fawning on them; and he was too clear-sighted not to see that, sooner or later, change was inevitable. But his interest was in the fascinating game of diplomacy; he was ambitious of playing the leading part on the great stage of international politics; and he was too consummate a courtier to risk the loss of the imperial favour by any insistence on unpalatable reforms, which, after all, would perhaps only reveal the necessity for the complete revolution which he feared.

The alternative was to use the whole force of the government to keep things as they were. The disintegrating force of the ever-simmering racial rivalries could be kept in check by the army; Hungarian regiments garrisoned Italy. Italian regiments guarded Galicia, Poles occupied Austria, and Austrians Hungary. The peril from the infiltration of "revolutionary" ideas from without was met by the erection round the Austrian dominions of a ring of states and censors, which had, however, no more success than is usual with such expedients. The peril from the independent growth of Liberalism within was guarded against by a rigid supervision of the press and the re-establishment of clerical control over education. Music alone flourished,

Thus, while the number of recruits, though varying from year to year, could be settled by the war department, the question of the claim of a single censurate for exemption, on grounds not recognized by precedent, could only be settled by imperial decree.

Forbidden books were the only ones read, and forbidden newspapers the only ones believed.

free from government interference; but, curiously enough, the movements, in Bohemia, Croatia and elsewhere, for the revival of the national literatures and languages—which were to issue in the most difficult problem facing the Austrian government at the opening of the 20th century—were encouraged in isolated circles, as tending to divert attention from political to purely scientific interests. Meanwhile the old system of provincial diets and estates was continued or revived (in 1816 in Tirol and Vorarlberg, 1817 in Galicia, 1818 in Carniol, 1828 in the circle of Salzburg), but they were in no sense representative, clergy and nobles alone being eligible, with a few delegates from the towns, and they had practically no functions beyond registering the imperial decrees, relative to recruiting or taxation, and dealing with matters of local police. Even the ancient right of petition was seldom exercised, and then only to meet with the imperial disfavour. And this stagnation of the administration was accompanied, as might have been expected, by economic stagnation. Agriculture languished, hampered, as in France before the Revolution, by the feudal privileges of a noble caste which no longer gave any equivalent service to the state; trade was strangled by the system of high tariffs at the frontier and internal octrois; and finally public credit was shaken to its foundations by lavish issues of paper money and the neglect to publish the budget.

The maintenance within the empire of a system so artificial and so unsound, involved in foreign affairs the policy of preventing the success of any movements by which it might be threatened. The triumph of Liberal principles or of national aspirations in Germany, or elsewhere in Europe, might easily, as the events of 1848 proved, shatter the whole rotten structure of the Habsburg monarchy, which survived only owing to the apathy of the populations it oppressed. This, then, is the explanation of the system of "stability" which Metternich succeeded in imposing for thirty years upon Europe. If he persuaded Frederick William III. that the grant of a popular constitution would be fatal to the Prussian monarchy, this was through no love of Prussia; the Carlsbad Decrees and the Vienna Final Act were designed to keep Germany quiet, lest the sleep of Austria should be disturbed; the lofty claims of the Troppau Protocol were but to cover an Austrian aggression directed to purely Austrian ends; and in the Eastern Question, the moral support given to the "legitimate" authority of the sultan over the "rebel" Greeks was dictated solely by the interest of Austria in maintaining the integrity of Turkey. (See Europe: History; Germany: History; Alexander I. of Russia; Metternich, &c.)

Judged by the standard of its own aims Metternich's diplomacy was, on the whole, completely successful. For fifteen years after the congress of Vienna, in spite of frequent alarms, the peace of Europe was not seriously disturbed; and even in 1830, the revolution at Paris found no echo in the great body of the Austrian dominions. The isolated revolts in Italy were easily suppressed; and the insurrection of Poland, though it provoked the lively sympathy of the Magyars and Czechs, led to no actual movement in the Habsburg states. For a moment, indeed, Metternich had meditated taking advantage of the popular feeling to throw the weight of Austria into the scale in favour of the Poles, and thus, by re-establishing a Polish kingdom under Austrian influence, to restore the barrier between the two empires which the partition of Poland had destroyed. But cautious counsels prevailed, and by the victory of the Russian arms the status quo was restored (see Poland).

The years that followed were not wanting in signs of the coming storm. On the 2nd of March 1835 Francis I. died, and was succeeded by his son Ferdinand I. The new emperor was personally amiable, but so enfeebled by epilepsy as to be incapable of ruling; a veiled regency had to be constituted to carry on the government, and the vices of the administration were further accentuated by weakness and divided counsels at the centre. Under these circumstances

1 In Hungary the diet was not summoned at all between 1811 and 1825, nor in Transylvania between 1811 and 1834.
popular discontent made rapid headway. The earliest symptoms of political agitation were in Hungary, where the diet began to show signs of vigorous life, and the growing Slav separatist movements, especially in the south of the kingdom, were rousing the old spirit of Magyar ascendency (see HUNGARY: History). For everywhere the Slav populations were growing restive under the German-Magyar domination. In Bohemia the Czech literary movement had developed into an organized resistance to the established order, which was attacked under the disguise of a criticism of the English administration in Ireland. “Repeal” became the watchword of Bohemian, as of Irish, nationalists (see BOHEMIA). Among the southern Slavs the “Illyrian” movement, voiced from 1836 onward in the Illyrian National Gazette of Ljudevit Gaj, was directed in the first instance to a somewhat shadowy Pan-Slav union, which, on the interference of the Austrian government in 1844, was exchanged for the more definite object of a revival of “the Trinine Kingdom” (Croatia, Slavonia, Dalmatia) independent of the Hungarian crown (see CROATIA, &c.). In the German provinces also, in spite of Metternich’s censors and police, the national movements in Germany had gained an entrance, and, as the revolution of 1848 in Vienna was to show, the most advanced revolutionary views were making headway.

The most important of all the symptoms of the approaching cataclysm was, however, the growing unrest among the peasants. As had been proved in France in 1789, and was again to be shown in Russia in 1906, the success of any political revolution depended ultimately upon the attitude of the peasant class. In this lies the main significance of the rising in Galicia in 1846. This was in its origin a Polish nationalist movement, hatched in the little independent republic of Cracow. As such it had little importance; though, owing to the incompetence of the Austrian commander, the Poles gained some initial successes. More fatal was the attitude of the Orthodox Ruthenian peasantry, who were divided from their Catholic Polish overlords by centuries of religious and feudal oppression. The Poles had sought, by lavish promises, to draw them into their ranks; their reply was to rise in support of the Austrian government. In the fight at Gdow (February 26th), where Benedek laid the foundations of the military reputation that was to end so tragically at Königgrätz, skill and scythe wrought more havoc in the rebel ranks than the Austrian musketry. Since, in spite of this object-lesson, the Polish nobles still continued their offers, the peasants consulted the local Austrian authorities as to what course they should take; and the local authorities, unaccustomed to being set at nought, without consulting Vienna, practically gave them carte blanche to do as they liked. A hideous jacquerie followed for three or four days; during which cartloads of dead were carried into Tarnow, where the peasants received a reward for every “ rebel ” brought in.

This affair was not only a scandal for which the Austrian government, through its agents, was responsible; but it placed the authorities at Vienna in a serious dilemma. For the Ruthenians, elated by their victory, refused to return to work, and demanded the abolition of all feudal obligations as the reward of their loyalty. To refuse this claim would have meant the indefinite prolongation of the crisis; to concede it would have been to invite the peasantry of the whole empire to put forth similar demands on pain of a general rising. On the 13th of April 1846 an imperial decree abolished some of the more burdensome feudal obligations; but this concession was greeted with so fierce an outcry, as an authoritative endorsement of the atrocities, that it was again revoked, and Count Franz von Stadion was sent to restore order in Galicia. The result was, that the peasants saw that though their wrongs were admitted, their sole hope of redress lay in a change of government, and added the de facto weight of their resentment to the forces making for revolution. It was the union of the agrarian with the nationalist movements that made the downfall of the Austrian system inevitable.

The material for the conflagration in Austria was thus all prepared when in February 1848 the fall of Louis Philippe fanned into a blaze the smouldering fires of revolution throughout Europe. On the 3rd of March, Kossuth, in the diet at Pressburg, delivered the famous speech which was the declaration of war of Hungarian Liberalism against the Austrian system. “ From the charnel-house of the Vienna cabinet,” he exclaimed, “ a pestilential air breathes on us, which dulls our nerves and paralyses the flight of our spirit.” Hungary liberated was to become the centre of freedom for all the races under the Austrian crown, and the outcome was to be a new “ fraternization of the Austrian peoples.” In the enthusiasm of the moment the crucial question of the position to be occupied by the conflicting nationalities in this “fraternal union” was overlooked. Germanism had so far served as the basis of the Austrian system, not as a national ideal, but because “it formed a sort of unnational mediating, and common element among the contradictory and clamorous racial tendencies.” But with the growth of the idea of German unity, Germanism had established a new ideal, of which the centre lay beyond the boundaries of the Austrian monarchy, and which was bound to be antagonistic to the aspirations of other races. The new doctrine of the fraternization of the Austrian races would inevitably soon come into conflict with the traditional German ascendency strengthened by the new sentiment of a united Germany. It was sown by the violence born in Austria and in Germany, for the revolution suffered shipwreck.

Meanwhile events progressed rapidly. On the 11th of March a meeting of “young Czechs” at Prague drew up a petition embodying nationalist and liberal demands; and on the same day the diet of Lower Austria petitioned the crown to summon a meeting of the delegates of the diets to set the Austrian finances in order. To this last proposal the government, next day, gave its consent. But in the actual temper of the Viennese the slightest concession was dangerous. The hall of the diet was invaded by a mob of students and workmen, Kossuth’s speech was read and its proposals adopted as the popular programme, and the members of the diet were forced to lead a tumultuous procession to the Hofburg, to force the assent of the government to a petition based on the catch-words of the Revolution. The authorities, taken by surprise, were forced to temporize and agreed to lay the petition before the emperor. Meanwhile round the hall of the diet a riot had broken out; the soldiers intervened and blood was shed. The middle classes now joined the rebels; and the riots had become a revolution. They were deterred by the violence born in the mob, which on the evening of the 13th of March, escaped from the Hofburg and passed into exile in England.

The fall of Metternich was the signal for the outbreak of the storm, not in Austria only, but throughout central Europe. In Hungary, on the 31st of March, the government was forced to consent to a new constitution which virtually erected Hungary into an independent state. On the 8th of April a separate constitution was promised to Bohemia; and if the petition of the Croats for a similar concession was rejected, this was due to the armed mob of Vienna, which was in close alliance with Kossuth and the Magyars. The impotence of the Austrian government in this crisis was due to the necessity of keeping the bulk of the Austrian forces in Italy, where the news of Metternich’s fall had also led to a concerted rising against the Habsburg rule (see ITALY). Upon the fortunes of war in the peninsula depended the ultimate issue of the revolutions so far as Austria was concerned.

The army and the prestige of the imperial tradition were, in fact, the two sheet-anchors that enabled the Habsburg monarchy to weather the storm. For the time the latter was the only one available; but it proved invaluable, especially in Germany, in preventing any settlement, until Radeck’s victory of Novara had set free the army, and thus once more enabled Austria to back her policy by force. The Austrian government, in no position to refuse, had consented to send delegates from its German provinces to the parliament of united Germany, which met at Frankfort on the 18th of May 1848. The question at
once arose of the place of the Austrian monarchy in united Germany. Were only its German provinces to be included? Or was it to be incorporated? As to the first, the Austrian government would not listen to the suggestion of a settlement which would have split the monarchy in half and subjected it to a double allegiance. As to the second, German patriots could not stomach the inclusion in Germany of a vast non-German population. The dilemma was from the first so obvious that the parliament would have done well to have recognized at once that the only possible solution was that arrived at, after the withdrawal of the Austrian delegates, by the exclusion of Austria altogether and the offer of the crown of Germany to Frederick William of Prussia. But the shadow of the Holy Empire, immemorially associated with the house of Habsburg, still darkened the counsels of German statesmen. The Austrian archduke John had been appointed regent, pending the election of an emperor; and the political leaders could neither break loose from the tradition of Austrian hegemony, nor reconcile themselves with the idea of a mutilated Germany, till it was too late, and Austria was once more in a position to re-establish the system devised by her diplomacy at the congress of Vienna. (See Germany: History.)

This fatal procrastination was perhaps not without excuse, in view of the critical situation of the Austrian monarchy during 1848. For months after the fall of Metternich Austria was practically without a central government. Vienna itself, where on the 14th of March the establishment of a National Guard was authorized by the emperor, was ruled by a committee of students and citizens, who arrogated to themselves a voice in imperial affairs, and imposed their will on the distracted ministry. On the 15th of March the government proposed to summon a central committee of local diets; but this was far from satisfying public opinion, and on the 25th of April a constitution was proclaimed, including the whole monarchy with the exception of Hungary and Lombardy-Venetia. This was, however, met by vigorous protests from Czechs and Poles, while its provisions for a partly nominated senate, and the indirect election of deputies, excited the wrath of radical Vienna. Committees of students and national guards were formed; on the 13th of May a Central Committee was established; and on the 15th a fresh insurrection broke out, as a result of which the government once more yielded, recognizing the Central Committee, admitting the right of the National Guard to take an active part in politics, and promising the convocation of a National Convention on the basis of a single chamber elected by universal suffrage. On the 17th the emperor left Vienna for Innsbruck "for the benefit of his health," and thence, on the 20th, issued a proclamation in which he cast himself on the loyalty of his faithful provinces, and, while confirming the concessions of March, ignored those of the 15th of May. The flight of the emperor had led to a revolution of feeling in Vienna; but the issue of the proclamation and the attempt of the government to disperse the students by closing the university, led to a fresh outbreak on the 26th. Once more the ministry conceded all the demands of the insurgents, and even went so far as to hand over the public treasury and the responsibility of keeping order to a newly constituted Committee of Public Safety.

The tide was now, however, on the turn. The Jacobinism of the Vienna democracy was not really representative of any widespread opinion even in the German parts of Austria, while its loud-voiced Germanism excited the lively opposition of the other races. Each of these had taken advantage of the March troubles to press its claims, and everywhere the government had shown the same yielding spirit. In Bohemia, where the attempt to hold elections for the Frankfort parliament had broken down on the opposition of the Czechs and the conservative German aristocracy, a separate constitution had been promulgated on the 8th of April; on March the 23rd the election by the diet of Agram of Baron Joseph Jellachich as ban of Croatia was confirmed, as a concession to the agitation among the southern Slavs; on the 18th of March Count Stadion had proclaimed a new constitution for Galicia. Even where, as in the case of the Serbs and Roumans, the government had given no formal sanction to the national claims, the emperor was regarded as the ultimate guarantee of their success; and deputations from the various provinces poured into Innsbruck protesting their loyalty.

To say that the government deliberately adopted the Machiavellian policy of mastering the revolution by setting race against race would be to pay too high a compliment to its capacity. The policy was forced upon it; and was only pursued consciously when it became obvious. Count Stadion began it in Galicia, where, before bombarding insurgent Cracow into submission (April 26), he had won over the Ruthenian peasants by the abolition of feudal dues and by forwarding a petition to the emperor for the official recognition of their language alongside Polish. But the great object lesson was furnished by the events in Prague, where the quarrel between Czechs and Germans, radicals and conservatives, issued on the 12th of June in a rising of the Czech students and populace. The suppression of this rising, and with it of the revolution in Bohemia, on the 16th of June, by Prince Windischgrätz, was not only the first victory of the army, but was the signal for the outbreak of a universal race war, in which the idea of constitutional liberty was sacrificed to the bitter spirit of national rivalry. The parliament at Frankfort hailed Windischgrätz as a national hero, and offered to send troops to his aid; the German revolutionists in Vienna welcomed every success of Radetzky's army in Italy as a victory for Germanism. The natural result was to drive the Slav nationalities to the side of the imperial government, since, whether at Vienna or at Budapest, the radicals were their worst enemies.

The 16th of June had been fatal to the idea of an independent Bohemia, fatal also to Pan-Slav dreams. To the Czechs the most immediate peril now seemed that from the German parliament, and in the interests of their nationality they were willing to depend upon the issue of the struggle against German nationalism. The Bohemian diet, summoned for the 10th, never met. Writs were issued in Bohemia for the election to the Austrian Reichsrath; and when, on the 10th of July, this assembled, the Slav deputies were found to be in a majority. This fact, which was to lead to violent trouble later, was at first subordinate to other issues, of which the most important was the question of the emancipation of the peasants. After long debates the law abolishing feudal services—the sole permanent outcome of the revolution—was carried on the 31st of August, and on the 7th of September received the imperial consent. The peasants thus received all that they desired, and their vast weight was henceforth thrown into the scale of the government against the revolution.

Meanwhile the alliance between the Slav nationalities and the conservative elements within the empire had found a powerful representative in Jellachich, the ban of Croatia. At first his activity was looked at askance, and his name was held as a "Ilyrian," but he had apparently identified himself with the "Ilyrian" party, had broken off all communications with the Hungarian government, and, in spite of an imperial edict issued in response to the urgency of Batthyány, had summoned a diet to Agram, which on the 6th of June decreed the separation of the "Triune Kingdom" from Hungary. The imperial government, which still hoped for Magyar aid against the Viennese revolutionists, repudiated the action of the ban, accused him of disobedience and treason, and deprived him of his military rank. But his true motives were soon apparent; his object was to play off the nationalism of the "Ilyrians" against the radicalism of Magyars and Germans, and thus to preserve his province for the monarchy; and the Hungarian radicals played into his hands. The fate of the Habsburg empire depended upon the issue of the campaign in Italy, which would have been lost by the withdrawal of the Magyar and Croatian regiments; and the Hungarian government chose this critical moment to tamper with the relations of the army to the monarchy. In May a National Guard had been established;
and the soldiers of the line were invited to join this, with the promise of higher pay; on the 1st of June the garrison of Pest took the oath to the Constitution. On the 9th Jellachich issued a proclamation to the Croatian regiments in Italy, bidding them remain and fight for the emperor and the common Fatherland. His loyalty to the tradition of the imperial army was thus announced, and the alliance was cemented between the army and the southern Slavs.

Jellachich, who had gone to Innsbruck to lay the Slav view before the emperor, was allowed to return to Agrag, though not as yet formally reinstated. Here the diet passed a resolution denouncing the dual system and demanding the restoration of the union of the empire. Thus was proclaimed the identity of the Slav and the conservative points of view; the radical "Illyrian" assembly had done its work, and on the 9th of July Jellachich, while declaring it "permanent," proroged it indefinitely "with a paternal greeting," on the ground that the safety of the Fatherland depended now "more upon physical than upon moral force." The diet thus proroged never met again. Absolute master of the forces of the banat, Jellachich now waited until the intractable politicians of Pest should give him the occasion and the excuse for setting the imperial army in motion against them.

The occasion came to be long postponed. Every day the rift between the dominant radical element in the Hungarian parliament and imperial court was widened. Kossuth and his followers were evidently aiming at the complete separation of Hungary from Austria; they were in sympathy, if not in alliance, with the German radicals in Vienna and Frankfort; they were less than half-heated in their support of the imperial arms in Italy. The imperial government, pressed by the Magyar nationalists to renounce Jellachich and all his works, equivocated and procrastinated, while within its councils the idea of a centralized state, to replace the loose federalism of the old empire, slowly took shape under the pressure of the military party. It was encouraged by the news from Italy, where, on the 25th of July, Radetzky had won the battle of Custozza, and on the 6th of August the Austrian standard once more floated over the towers of Milan. At Custozza Magyar hussars, Croats from the Military Frontier, and Tirolese sharpshooters had fought side by side. The possibility was obvious of combating the radical and nationalist revolution by means of the army, with its spirit of comradeship in arms and its imperialist traditions.

So early as the beginning of July, Austrian officers, with the permission of the minister of war, had joined the Serb insurgents who, under Stratemirović, were defying the Magyar power in the banat. By the end of August the breach between the Austrian and Hungarian governments was open and complete; on the 4th of September Jellachich was reinstated in all his honours, and on the 11th he crossed the Drave to the invasion of Hungary. The die was thus cast; and, though efforts continued to be made to arrange matters, the time for moderate counsels was passed. The conservative leaders of the Hungarian nationalists, Eötvös and Deák, retired from public life; and, though Batthyány resigned to remain in office, the slender hope that this gave of peace was ruined by the flight of the palatine (September 24) and the murder of Count Lamberg, the newly appointed commissioner and commander-in-chief in Hungary, by the mob at Pest (September 27). The appeal was now to arms; and the fortunes of the Habsburg monarchy were bound up with the fate of the war in Hungary (see HUNGARY: History).

On the 16th an imperial rescript appointed him a field-marshal and commander-in-chief of all the Austrian armies except that of Italy. Meanwhile, of the Reichsrath, the members of the right and the Slav majority had left Vienna and announced a meeting of the diet at Brün for the 20th of October; all that remained in the capital was a rump of German radicals, impotent in the hands of the proletariat and the students. The defence of the city was hastily organized under Bem, an ex-officer of Napoleon; but in the absence of help from Hungary it was futile. On the 28th of October Windischgrätz began his attack; on the 1st of November he was master of the city.

The fall of revolutionary Vienna practically involved that of the revolution in Frankfort and in Pest. From Italy the congratulations of Radetzky's victorious army came to Windischgrätz, from Russia the even more significant commendations of the emperor Nicholas. The moral of the victory was painted for all the world by the military execution of Robert Blum, whose person, as a deputy of the German parliament, should have been sacrosanct. The time had, indeed, not yet come to attempt any conspicuous breach with the constitutional principle; but the new ministry was such as the imperial sentiment would approve, inimical to the German ideals of Frankfort, devoted to the restoration of the Habsburg monarchy. At its head was Prince Felix Schwarzenberg (65), "an army-chancellor," a statesman at once strong and unscrupulous. On the 27th of November a proclamation announced that the continuation of Austria as a united state was necessary both for Germany and for Europe. On the 2nd of December the emperor Ferdinand, bound by too many personal obligations to the revolutionary parties to serve as a useful instrument for the new policy, abdicated, and his nephew Francis Joseph ascended the throne. The proclamation of the new emperor was a gage of defiance thrown down to Magyars and German unionists alike: "Firmly determined to preserve undimmed the lustre of our crown," it ran, "but prepared to share our rights with the representatives of our peoples, we trust that with God's aid and in common with our peoples we shall succeed in uniting all the countries and races of the monarchy in one great body politic."

While the Reichsrath, transferred to Kremsier, was discussing "fundamental rights" and the difficult question of how to reconcile the theological unity with the actual dualism of the present, the Austrian troops were brought to the plains of Hungary. The Hungarian retreat after the bloody battle of Kapolna (February 26-27, 1849) was followed by the dissolution of the Kremsier assembly, and a proclamation in which the emperor announced his intention of granting a constitution to the whole monarchy "one and indivisible." On the 4th of March the constitution was published; but it proved all but as distasteful to Czechs and Croats as to the Magyars, and the speedy successes of the Hungarian arms made it, for the while, a dead letter. It needed the intervention of the emperor Nicholas, in the loftiest spirit of the Holy Alliance, before even an experimental unity of the Habsburg dominions could be established (see HUNGARY: History).

The capitalisation of Villágó, which ended the Hungarian insurrection, gave Schwarzenberg a free hand for completing the work of restoring the status quo ante and the influence of Austria in Germany. The account of the process by which this was accomplished belongs to the history of Germany (q.v.). Here it will suffice to say that the terms of the Convention of Pressburg (November 30, 1849) seemed at the time to be a complete triumph for Austria over Prussia. As a matter of fact, however, the convention was, in the words of Count Beust, "not a Prussian humiliation, but an Austrian weakness." It was in the power of Austria to crush Prussia and to put an end to the dual influence in the Confederation which experience had proved to be unworkable; she preferred to re-establish a discredited system, and to leave to Prussia time and opportunity to gather strength for the inevitable conflict.

In 1851 Austria had apparently triumphed over all its
difficulties. The revolutionary movements had been suppressed, the attempt of Prussia to assume the leadership in Germany defeated, the old Federal Diet of 1815 had been restored. Vienna again became the centre of a despotic government the objects of which were to Germanize the Magyars andSlavs, to check all agitation for a constitution, and to suppress all attempts to secure a free press. For some ten years the Austrian dominion groaned under one of the worst possible forms of autocratic government. The failure of the Habsburg emperor to perpetuate this despotic régime was due (1) to the Crimean War, (2) to the establishment of Italian unity, and (3) to the successful assertion by Prussia of its claim to the leadership in Germany. The disputes which resulted in the Crimean War revealed the fact that "gratitude" plays but a small part in international affairs. In the minds of Austrian statesmen the question of the free navigation of the Danube, which would have been impeded by a Russian occupation of the Principalities, outweighed their sense of obligation to Russia, on which the emperor Nicholas had rashly relied. That Austria at first took no active part in the war was due, not to any sentimental weakness, but to the refusal of Russia to allow her to participate with her allies in a Sardinian attack on her Italian provinces. But, on the withdrawal of the Russian forces from the Principalities, these were occupied by Austrian troops, and on the 2nd of December 1854, a treaty of alliance was signed at Vienna, between Great Britain, Austria and France, by which Austria undertook to occupy Moldavia and Walachia during the continuation of the war and "to defend the frontier of the Principalities against any return of the Russian forces." By Article III., in the event of war between Russia and Austria the alliance both offensive and defensive was to be made effective (Hertslet, No. 252). With the progressive disasters of the Russian arms, however, Austria grew bolder, and it was the ultimatum delivered by her to the emperor Alexander II. in December 1855, that forced Russia to come to terms (Treaty of Paris, March 30, 1856).

Though, however, Austria by her diplomatic attitude had secured, without striking a blow, the settlement in her sense of the Eastern Question, she emerged from the contest without allies and without friends. The "Holy Alliance" of the three autocratic northern powers, cemented at Münchengrätz in 1833, which had gained for Austria the decisive intervention of the tsar in 1849, had been hopelessly shattered by her attitude during the Crimean War. Russia, justly offended, drew closer her ties with Prussia, where Bismarck was already hatching the plans which were to mature in 1866; and, if the attitude of Napoleon in the Polish question prevented any revival of the alliance of Tilsit, the goodwill of Russia was assured for France in the coming struggle with Austria in Italy. Already the isolation of Austria had been conspicuous in the congress of Paris, where Cavour, the Sardinian plenipotentiary, laid bare before assembled Europe the scandal of her rule in Italy. It was emphasized during the campaign of 1859, when Sardinia, in alliance with France, laid the foundations of united Italy. The plans of the Austrian government for reconquering the lost provinces of the armistice of Villafranca, was due, not to love of Austria, but to fear of the undue aggvidgement of France. The campaign of 1859, and the diplomatic events that led up to it, are dealt with elsewhere (see ITALY, ITALIAN WARS, NAPOLEON III., CAVOUR). The results to Austria were two-fold. Externally, she lost all her Italian possessions except Venice; internally, her failure led to the necessity of conciliating public opinion by constitutional concessions.

The proclamation on the 26th of February 1861 of the new constitution for the whole monarchy, elaborated by Anton von Schmerling, though far from satisfying the national aspirations of the races within the empire, at least gave Austria a temporary popularity in Germany; the liberalism of the Habsburg monarchy was favourably contrasted with the "reactionary" policy of Prussia, where Bismarck was defying the majority of the diet in his determination to build up the military power of Prussia. The meeting of the princes summoned to Frankfort by the emperor Francis Joseph, in 1863, revealed the ascendency of Austria among the smaller states of the Confederation; but it revealed also the impossibility of any consolidation of the Confederation without the co-operation of Prussia, which stood outside. Bismarck had long since decided that the matter could only be settled by the exclusion of Austria altogether, and that the means to this end would not be discussion, but "Blood and Iron." The issue was forced by the developments of the tangled Schleswig-Holstein Question (q.v.), which led to the definitive breach between the two great German powers, to the campaign of 1866, and the collapse of Austria on the field of Königgrätz (July 3. See SEVEN WEEKS' WAR). (W. A. P.; A. H.)

The war of 1866 began a new era in the history of the Austrian empire. By the treaty of Prague (August 23, 1866) the emperor surrendered the position in Germany which his ancestors had held for so many centuries; Austria and Tirol, Bohemia and Salzburg, ceased to be German, and eight million Germans were cut off from all political union with their fellow-countrymen. At the time the surrender of Venetia completed the work of 1859, and the last remnant of the old-established Habsburg dominion in Italy ceased. The war was immediately followed by a reorganization of the government. The Magyar nation, as well as the Czechs, had refused to recognize the new state of affairs. Thus the question of the dual monarchy.

1 For the separate political histories of Austria and Hungary see the section on II. Austria Proper, below. and HUNGARY; the present section deals with the history of the whole monarchy as such.
that there should be constitutional government in the rest of the monarchy as well as in Hungary, and a parliament in which all the other territories should be represented. From both the Hungarian and the Austrian parliament there was to be elected a Delegation, consisting of sixty members; to these Delegations the ministers of the commonwealth were to be responsible, and to them the estimates for the joint services were to be submitted. The annual meetings were to be held alternately in Vienna and in Pest. They were very careful that these Delegations should not overshadow the parliaments by which they were appointed. The Delegations were not to sit together; each was to meet separately; they were to communicate by writing, every document being accompanied by a translation in Magyar or German, as the case might be; only if after three times exchanging notes they failed to agree was there to be a common session; in that case there would be no discussion, and they were to vote in silence; a simple majority was sufficient. There were to be three ministers for common purposes—(1) for foreign affairs; (2) for war; (3) for finance; these ministers were responsible to the Delegations, but the Delegations were really given no legislative power. The emperor of war controlled the common army, and the laws determining the method of which the army was to be recruited had to be voted separately in each of the parliaments. The minister of finance had to lay before them the common budget, but they could not raise money or vote taxes; after they had passed the budget the money required had to be provided by the separate parliaments. Even the determination of the proportion which each half of the monarchy was to contribute was not left to the Delegations. It was to be fixed once every ten years by separate committees chosen for that purpose from the Austrian Reichsrath and the Hungarian parliament, the so-called Quota-Deputations. In addition to these “common affairs” the Hungarians, indeed, recognized that there were certain other matters which it was desirable should be managed on identical principles in the two halves of the monarchy—namely, customs and excise currency; the army and common railways. For these, however, no common institutions were created; they must be arranged by agreement; the ministers must confer and then introduce identical acts in the Hungarian and the Austrian parliaments.

The main principles of this agreement were decided during the spring of 1867; but during this period the Austrians were not really consulted at all. The negotiations on behalf of the court of Vienna were entrusted to Beust, whom the emperor appointed chancellor of the empire and also minister-president of Austria. He had no previous experience of Austrian affairs, and was only anxious at once to bring about a settlement which would enable the empire to take a strong position in international politics. In the summer of 1867, however (the Austrian Reichsrath having met), the two parliaments each elected a deputation of fifteen members to arrange the financial settlement. The first matter was the debt, amounting to over 3000 million gulden, in addition to the floating debt, which had been contracted during recent years. The Hungarians laid down the principle that they were in no way responsible for debts contracted during a time when they had been deprived of their constitutional liberties; they contended, however, to pay each year 200 million gulden towards the interest. The whole responsibility for the payment of the remainder of the interest, amounting annually to over a hundred million gulden, and the management of the debt, was left to the Austrians. The Hungarians wished that a considerable part of it should be repudiated. It was then agreed that the two states should form a Customs Union for the next ten years; the customs were to be paid to the common exchequer; all sums required in addition to this to meet the expenses were to be provided as to 30% by Hungary and as to 70% by Austria. After the financial question had been thus settled, the whole of these arrangements were then, on the 21st and the 24th of December 1867, enacted by the two parliaments, and the system of dualism was established.

The acts were accepted in Austria out of necessity; but no parties were really satisfied. The Germans, who accepted the principle of dualism, were indifferent at the financial arrangements; for Hungary, while gaining more than an equal share of power, paid less than one-third of the common expenses. On the other hand, according to British ideas of taxable capacity, Hungary paid, and still pays, more than her share. The Germans, however, could at least hope that in the future the financial arrangements might be revised; the complaints of the Slav races were political, and within the constitution there was no means of remedy, for, while the settlement gave to the Hungarians all that they demanded, it deprived the Bohemians or Galicians of any hope that they would be able to obtain similar independence. Politically, the principle underlying the agreement was that the empire should be divided into two portions; in one of these the Magyars were to rule, in the other the Germans; in either section the Slav races—the Serbs and Croats, the Czechs, Poles and Slovenes—were to be placed in a position of political inferiority.  

The logical consistency with which the principle of Dualism was carried out is shown in a change of title. By a letter to Beust of the 14th of November 1868 the emperor ordered that he should henceforward be styled, not as before, “Emperor of Austria, King of Hungary, King of Bohemia, etc.” but “Emperor of Austria, King of Hungary, King of Bohemia.” It was also necessary by signifying the separation of the two districts over which he rules. His shorter style is “His Majesty the Emperor and King,” and “His Imperial and Apostolic Royal Majesty;” the lands over which he rules are called “The Austro-Hungarian Empire.” The new terminology, “Imperial and Royal” (“Kaiserlich und Königlich”), has since then been applied to all those branches of the public service which belong to the common ministries; the Austrian Kingdom has been reduced to the Austrian-Hungarian Realm.” The new terminology, “Imperial and Royal” (“Kaiserlich und Königlich”), has since then been applied to all those branches of the public service which belong to the common ministries; the Austrian Kingdom has been reduced to the Austrian-Hungarian Realm. The new terminology, “Imperial and Royal” (“Kaiserlich und Königlich”), has since then been applied to all those branches of the public service which belong to the common ministries; the Austrian Kingdom has been reduced to the Austrian-Hungarian Realm. The new terminology, “Imperial and Royal” (“Kaiserlich und Königlich”), has since then been applied to all those branches of the public service which belong to the common ministries; the Austrian Kingdom has been reduced to the Austrian-Hungarian Realm. The new terminology, “Imperial and Royal” (“Kaiserlich und Königlich”), has since then been applied to all those branches of the public service which belong to the common ministries; the Austrian Kingdom has been reduced to the Austrian-Hungarian Realm.

The settlement with Hungary consisted then of three parts:—(1) the political settlement, which was to be permanent and has since remained part of the fundamental constitution of the monarchy; (2) the periodical financial settlement, determining the partition of the common expenses as arranged by the Quota-Deputations and ratified by the parliaments; (3) the Customs Eun and the agreement as to currency—a voluntary and terminable arrangement made between the two governments and parliaments. The history of the common affairs which fall under the management of the common ministries is, then, the history of the foreign policy of the empire and of the army. It is with this and this alone that the Delegations are occupied, and it is to this that we must now turn. The annual meetings call for little notice; they have generally been, at the request of the Hungarian ministers, postponed and justified his policy; according to the English custom, red books, sometimes containing important despatches, have been laid before them; but the debates have caused less embarrassment to the government than is generally the case in parliamentary assemblies, and the army budget has generally been passed with few and unimportant alterations.

For the first four years, while Beust was chancellor, the foreign policy was still influenced by the feelings left by the war of 1866. We do not know how far there was a real intention to revenge Königgrätz and recover the position lost in Germany. This would be at least a possible policy, and one to which Beust by his previous history would be inclined. There were sharp passages of arms with the

AUSTRIA-HUNGARY

Russian government regarding the position of the South German states; a close friendship was maintained with France; there were meetings of the emperor and of Napoleon at Salzburg in 1868, and the next year at Paris; the death of Maximilian in Mexico cast a shadow over the friendship, but did not destroy it. The opposition of the Hungarians and financial difficulties probably prevented a warlike policy. In 1870 there were discussions preparatory to a formal alliance with France against the North German Confederation, but nothing was signed. The war of 1870 put an end to all ideas of this kind; the German successes were so rapid that Austria was not exposed to the temptation of intervening, a temptation that could hardly have been resisted had the result been doubtful or the struggle prolonged. The absorption of South Germany in the German empire took away the chief cause for friction; and from that time warm friendship, based on the maintenance of the established order, has existed between the two empires. Austria gave up all hope of regaining her position in Germany; Germany disclaimed all intention of acquiring the German provinces of Austria. Beust’s retirement in 1871 put the finishing touch on the new relations. His successor, Count Andrassy, a Hungarian, established a good understanding with Bismarck; and in 1872 the visit of the emperor Francis Joseph, accompanied by his minister, to Berlin, was the final sign of the reconciliation with his uncle. The tsar was also present on that occasion, and for the next six years the close friendship between the three empires removed all danger of war. Three years later the full reconciliation with Italy followed, when Francis Joseph consented to visit Victor Emmanuel in Venice.

The outbreak of disturbance in the Balkans ended this period of calm. The insurrection in Bosnia and Herzegovina immediately affected Austria; refugees in large numbers crossed the frontier and had to be maintained by the government. The political problem presented was very difficult. The sympathy of the Slav inhabitants of the empire made it impossible for the government of Vienna to regard with indifference the sufferings of Christians in Turkey. Active support was impossible, because the Hungarians, among whom the events of 1848 had obliterated the remembrance of the earlier days of Turkish conquest, were full of sympathy for the Turks. It was a cardinal principle of Austrian policy that she could not allow the erection of new Slav states on her southern frontier. Moreover, the disturbances were fomented by Russian agents, and any increase of Russian influence (for which the Pan-Slav party was working) was full of danger to Austria. For a time the mediation of Germany preserved the good understanding between the two eastern empires. In 1875 Andrassy drafted a note, which was accepted by the powers, requiring Turkey to institute the reforms necessary for the good government of the provinces. Turkey agreed to do this, but the insurgents required a guarantee from the Powers that Turkey would keep her engagements. This could not be given, and the rebellion continued and spread to Bulgaria. The lead then passed to Russia, and Austria, even after the outbreak of war, did not oppose Russian measures. At the beginning of 1877 a secret understanding had been made between the two powers, by which Russia undertook not to annex any territory, and in other ways not to take steps which would be injurious to Austria. The advance of the Russian army on Constantinoople, however, was a serious menace to Austrian influence; Andrassy therefore demanded that the terms of peace should be submitted to a European conference, which he suggested should meet at Vienna. The peace of San Stefano violated the engagements made by Russia, and Andrassy was therefore compelled to ask for a credit of 60 million gulden and to mobilize a small portion of the army; the money was granted unanimously in the Hungarian Delegation, though the Magyars disliked a policy the object of which appeared to be the defense of Turkey against Russia, but an agreement with Russia which would give Austria compensation at the expense of Turkey; in the Austrian Deputation it was voted only by a majority of 39 to 20, for the Germans were alarmed at the report that it would be used for an occupation of part of the Turkish territory.

The active share taken by Great Britain, however, relieved Austria from the necessity of having recourse to further measures. By an arrangement made beforehand, Austria was requested at the congress of Berlin to undertake the occupation and administration of Bosnia and Herzegovina—an honourable but arduous task. The provinces could not be left to the Turks; Austria could not allow them to fall under Russian influence. The occupation was immediately begun, and 60,000 Austrian troops, under the command of General Philippovich, crossed the frontier on the 29th of July. The work was, however, more difficult than had been anticipated; the Mahomedans offered a strenuous resistance; military operations were attended with great difficulty in the mountainous country; 200,000 men were required, and they did not succeed in overcoming the distance till after some months of obstinate fighting. The losses on either side were very heavy; even after the capture of Sarajevo in August, the resistance was continued; and besides those who fell in battle, a considerable number of the insurgents were put to death under military law. The opposition in the Delegations, which met at the end of the year, was so strong that the government had to be content with a credit to cover the expenses for 1879 of less than half what they had originally asked, and the supplementary estimate of 40,000,000 gulden for 1878 was not voted till the next year. In 1879 the Porte, after long delay, recognized the occupation on the distinct understanding that the sovereignty of the sultan was acknowledged. A civil administration was then established, the provinces not being attached to either half of the empire, but placed under the control of the joint minister of finance. The government during the first two years was very successful; the Christian population were disappointed at finding that they still had, as in the old days, to pay rent to the Mahomedan beggars. There were difficulties also between the Roman Catholics and the members of the Greek Church. In 1881 disturbances in Dalmatia spread over the frontier into Herzegovina, and another expedition had to be sent to restore order. When this was done Benjamin de Kallay was appointed minister, and under his judicious government order and prosperity were established in the provinces. In accordance with another clause of the treaty of Berlin, Austria was permitted to place troops in the sanjak of Novi-Bazar, a district of great strategic importance, which separated Servia and Montenegro, and through which the communication between Bosnia and Salonica passed. This was done in September 1879 an agreement with Turkey having specified the numbers and position of the garrison. Another slight alteration of the frontier was made in the same year, when, during the delimitation of the new frontier of Montenegro, the district of Spizza was incorporated in the kingdom of Dalmatia.

The congress of Berlin indirectly caused some difficulties with Italy. In that country was a large party which, under the name of the “Irredentists,” demanded that those Italian-speaking districts, South Tirol, Istria and Trieste, which were under Austrian rule, should be joined to Italy; there were public meetings and riots in Italy; the Austrian flag was torn down from the consulate in Venice and the embassy at Rome insulted. The excitement spread across the frontier; there were riots in Trieste, and in Tirol it was necessary to make some slight movement of troops as a sign that the Austrian government was determined not to surrender any territory. For a short time there was apprehension that the Italian government might not be strong enough to resist the movement, and might even attempt to realize these wishes by means of an alliance with Russia; but the danger quickly passed away.

In the year 1879 the European position of the monarchy was

1 See General Le Brun, Souvenirs militaires (1866-1870, Paris, 1895); also, Baron de Worms, op. cit., and the article on Beust.
placed on a more secure footing by the conclusion of a formal alliance with Germany. In the autumn of that year Bismarck visited Vienna and arranged with Andrassy, the treaty by which Germany bound herself to support Austria against an attack from Russia, Austria-Hungary pledging herself to help Germany against a combined attack of France and Russia; the result of this treaty, of which the tsar was informed, was to remove, at least for the time, the danger of war between Austria-Hungary and Russia. It was the last achievement of Andrassy, who had already resigned, but it was maintained by his successor, Baron Haymerle, and after his death in 1881 by Count Kalnoky. It was strengthened in 1882 by the adhesion of Italy, for after 1881 the Italians required support, owing to the French occupation of Tunis, and after five years it was renewed. Since that time it has been the foundation on which the policy of Austria-Hungary has depended, and it has survived all dangers arising either from commercial differences (as between 1880 and 1890) or national discord. The alliance was naturally very popular among the German Austrians; some of them went so far as to attempt to use it to influence internal policy, and suggested that fidelity to this alliance required that there should be a minister of foreign affairs, which supported Germany in their internal struggle with the Slavs; they represented it as a national alliance of the Teutonic races, and there were some Germans in the empire who supported them in this view. The governments on both sides could of course give no countenance to this theory; Bismarck especially was very careful never to let it be supposed that he desired to exercise influence over the internal affairs of his ally. Had he done so, the strong anti-German passions of the Czechs and Poles, always inclined to an alliance with France, would have been aroused, and no government could have maintained the alliance. After 1880, the exertions of Count Kalnoky again established a fairly good understanding with Russia, as was shown by the meetings of Francis Joseph with the tsar in 1884 and 1885, but the outbreak of the Bulgarian question in 1885 again brought into prominence the supposed interests of Russia and Austria-Hungary. In the December of this year Austria-Hungary indeed decisively interfered in the war between Bulgaria and Servia, for at this time Austrian influence predominated in Servia, and after the battle of Slivnitza, the Russian minister Prince Alexander of Bulgaria that if he advanced farther he would be met by Austro-Hungarian as well as Servian troops. But after the abdication of Alexander, Count Kalnoky stated in the Delegations that Austria-Hungary would not permit Russia to interfere with the independence of Bulgaria. This decided step was required by Hungarian feeling, but it was a policy in which Austria-Hungary could not depend on the support of Germany, for—as Bismarck stated—Bulgaria was not worth the bones of a single Pomeranian grenadier. Austria-Hungary also differed from Russia as to the position of Prince Ferdinand of Bulgaria, and during 1886–1887 much alarm was caused by the massing of Russian troops on the Galician frontier. Councils of war were summoned to consider how this exposed and distant province was to be defended, and for some months war was considered inevitable; but the danger was averted by the renewal of the Triple Alliance and the other decisive steps taken at this time by the German government (see Germany). Since this time the foreign policy of Austria-Hungary has been peaceable and unambitious; the close connexion with Germany has so far been maintained, though during the last few years it has been increasingly difficult to prevent the violent passions engendered by national enmity at home from reacting on the foreign policy of the monarchy; it would scarcely be possible to do so, were it not that discussions on foreign policy take place not in the parlaments but in the Delegations where the numbers are fewer and the passions cooler. In May 1895 Count Kalnoky had to retire, owing to a difference with Bánfly, the Hungarian premier, arising out of the struggle with Rome. He was succeeded by Count Goluchowski, the son of a well-known Polish statesman. In 1898 the expulsion of Austrian subjects from Prussia, in connexion with the Anti-Polish policy of the Prussian government, caused a passing irritation, to which Count Thun, the Austrian premier, gave an obstruction which the foreign office of the government in recent years have been to maintain Austro-Hungarian trade and influence in the Balkan states by the building of railways, by the opening of the Danube for navigation, and by commercial treaties with Rumania, Servia and Bulgaria; since the abdication of King Milan especially, the affairs of Servia and the growth of Russian influence in that country have caused serious anxiety.

The disturbed state of European politics and the great increase in the military establishments of other countries made it desirable for Austria also to strengthen her military resources. The army. The bad condition of the finances rendered it, however, impossible to carry out any very great measures. In 1868 there had been introduced compulsory military service in both Austria and Hungary; the total of the army available in war had been fixed at 800,000 men. Besides this joint army placed under the joint ministry of war, there was in each part of the monarchy a separate militia and a separate minister for national defence. Austria-Hungary this national force of citizens was kept quite distinct from the regular army, and for the command of the latter was taken in Dalmatia and Tirol, where there was a separate local militia, the Landwehr, as it was called, was practically organized as part of the standing army. At the renewal of the periodical financial and economic settlement (Ausgleich) in 1877 no important change was made, but in 1882 the system of compulsory service was extended to Bosnia and Herzegovina, and a reorganization was carried out, including the introduction of army corps and local organization on the Prussian plan. This was useful for the purposes of speedy mobilization, though there was some danger that the local and national spirit might penetrate into the army. In 1886 a law was carried in either parliament creating a Landsturm, and providing for the arming and organization of the whole male population up to the age of forty-two in case of emergency, and in 1889 a small increase was made in the annual number of recruits. A further increase was made in 1892–1893. In contrast, however, with the military history of other continental powers, that of Austria-Hungary shows a small increase in the army during the year. There have been signs of an attempt to tamper with the use of German as the common language for the whole army. This, which is now the principal remnant of the old ascendancy of German, and the one point of unity for the whole monarchy, is a matter on which the government and the monarch allow no concession, but in the Hungarian parliament protests against it have been raised, and in 1890 and 1900 it was necessary to punish recruits from Bohemia, who answered the roll call in the Czechish žde instead of the German hier.

In those matters which belong to the periodical and terminable agreement, the most important is the Customs Union, which was established in 1867, and it is convenient to treat separately the commercial policy of the dual state. At first the customs tariff in Austria-Hungary, as in most other countries, was based on a number of commercial treaties with Germany, France, Italy, Great Britain, &c., each of which specified the maximum duties that could be levied on certain articles, and all of which contained a "most favoured nation" clause. The practical result was a system very nearly approaching to the absence of any customs duties, and for the period for which these treaties lasted a revision of the tariff could not be carried out by means of legislation. After the year 1873, a strong movement in favour of protective duties made itself felt among the Austrian manufacturers who were affected by the competition of German, English and Belgian goods, and Austria was influenced by the general movement in economic thought which about this time caused the reaction.

2 Matlekovics, Die Zollpolitik der österreichisch-ungarischen Monarchie (Leipzig, 1891), gives the Hungarian point of view; Bazant, Die Handelspolitik Österreich-Ungarns (1875–1892, Leipzig, 1894).
against the doctrines of free trade. Hungary, on the other hand, was still in favour of free trade, for there were no important manufacturing industries in that country, and it required a secure market for agricultural produce. After 1875 the commercial treaties expired; Hungary thereupon also gave notice to terminate the commercial union with Austria, and negotiations began as to the principle on which it was to be renewed. This was done during the year 1877, and in the new treaty, while raw material was still imported free of duty, a low duty was placed on textile goods as well as on corn, and the excise on sugar and brandy was raised. All duties, moreover, were to be paid in gold—this at once involving a considerable increase.

The tariff treaties with Great Britain and France were not renewed, and all attempts to come to some agreement with Germany broke down, owing to the change of policy which Bismarck was adopting at this period. The result was that the system of commercial treaties ceased, and Austria-Hungary was free to introduce a fresh tariff depending simply on legislation, an "autonomous tariff" as it is called. With Great Britain, France and Germany, there was now only a "most favoured nation" agreement; fresh commercial treaties were made with Italy (1879), Switzerland and Servia (1881). During 1881–1882 Hungary, desiring means of retaliation against the duties on corn and the impediments to the importation of cattle recently introduced into Germany, withdrew her opposition to protective duties; the tariff was completely revised, protective duties were introduced on all articles of home production, and high finance duties on other articles such as coffee and petroleum. At the same time special privileges were granted to articles imported by sea, so as to foster the trade of Trieste and Fiume; as in Germany, a subvention was granted to the great shipping companies, the Austrian Lloyd and Adria; the area of the Customs Union was enlarged so as to include Trieste, Istria and Dalmatia, as well as Bosnia and Herzegovina. In 1887 a further increase of duties was laid on corn (this was the desire of Hungary as against Rumania), for a vigorous customs war was being carried on at this time) and on woollen and textile goods. Austria, therefore, during these years completely gave up the principle of free trade, and adopted a nationalist policy similar to that which prevailed in Germany. A peculiar feature of these treaties was that the government was empowered to impose an additional duty (Revisionszoll) on goods imported from countries in which Austria-Hungary received unfavourable treatment. In 1881 this was fixed at 10% (5% for some articles), but in 1887 it was raised to 30 and 50% respectively.

In 1892 Austria-Hungary joined with Germany, Italy, Belgium, and Switzerland in commercial treaties to last for twelve years, the object being to secure to the states of central Europe a stable and extended market; for the introduction of high tariffs in Russia and America had crippled industry. Two years later Austria-Hungary also arranged with Russia a treaty similar to that already made between Russia and Germany; the reductions in the tariff secured in these treaties were applicable also to Great Britain, with which there still was a most favoured nation treaty, though this introduced gave commercial security till the year 1903.

The result of these and other laws was an improvement in financial conditions, which enabled the government at last to take in hand the long-delayed task of reforming the currency. Hitherto the currency had been partly in silver (gulden) and partly in gold ("Austrian currency" which had been introduced in 1857, partly in paper money, which took the form of notes issued by the Austro-Hungarian Bank. This institution had, in 1867, become a national bank; it had been obliged to authorize the bank to suspend cash payments, and the wars of 1859 and 1866 had rendered abortive all attempts to rechristen them. The notes, therefore, formed an inconvertible paper currency. The bank by its charter had the sole right of issuing notes, but during the war of 1866 the government, in order to raise money, had itself issued notes (Staatsnoten) to the value of 312 million gulden, thereby violating the charter of the bank. The operation began in 1892 was therefore threshold: (1) the substitution of a gold for a silver standard; (2) the redemption of the Staatsnoten; (3) the assumption by the government of the entire debt.

In 1896 Austria-Hungary had taken part in the monetary conference which led to the formation of the Latin Union; it was intended to join the Union, but this was not done. A first step, however, had been taken in this direction in that an issue of gold coins, of the value of eight and four gulden. No attempt was made to regulate the relations of these coins to the "Austrian" silver coinage; the two issues were not brought into connexion, and every payment in gold, whether in silver, was definitely agreed that it should be paid in gold. In 1879, owing to the continued depreciation of silver, the free coinage of silver was suspended. In 1892 laws introducing a completely new coinage were carried in both parliaments, in accordance with agreements made by the ministers. The unit in the new currency was to be the krona, divided into two golds, and at almost the same value (24-25th) as the franc. (The twenty-krona piece in gold weighs 6.775 gr., the twenty-farc piece 6.453.)

The gold coin was equal to .42 of the gold gulden, and it was declared in 1896 to be the silver coinage, but the silver gulden was to be redeemed for the depreciation of silver. The first step towards putting this act into practice was the issue of one-krona pieces (silver), which circulated as half gulden; and of nickel coins; all the copper coins and other silver pieces were recalled from circulation. The coinage of the gold four- and eight-gulden was suspended. Nothing more could be done till the supply of gold had been increased. The bank was required to buy gold (during 1892 it had bought 150 million krona); a further condition was that the gulden had, when the currency was stabilized, be convertible at the rate of the new silver one-krona pieces and gulden, and in bank notes, the coins and notes being provided by the bank, and in exchange the newly-coined gold was paid to the bank to be kept as a reserve to cover the issue of new gulden. This agreement with the Latin Union was a source of confusion, for the Austrian and Hungarian banks had to pay to Austria and Hungary to pay off about 80 million of exchequer bills which had been issued on the security of the government salt-works, and were therefore called salinenoshie. In 1899 the remainder of the Staatsnoten (170 million gulden) were redeemed in a similar manner. The bank had in this way acquired a large reserve of gold, and in the new charter which was (after long delay) passed in 1899, a clause was introduced requiring the resumption of cash payments, though this was not to come into operation immediately. Then from 1st January 1900 the old reckoning by gulden was superseded, that by krona being introduced in all government accounts, the new silver being made a legal tender only for a limited amount. For the time being 1st of July 1903 gulden were left in circulation, payments made in them, at the rate of two krona to one gulden, being legal up to any amount.

This important reform has thereby been brought to a satisfactory conclusion, and at a low cost. The political difficulties had reached a most acute stage. It is indeed remarkable, considering the complicated machinery of the dual monarchy, and the numerous obstacles which have to be overcome before a reform affecting both countries can be carried out, the financial, the commercial, and the political policy has been achieved, and that the credit of the state has risen, the chronic deficit has disappeared, the currency has been put on a sound basis, and part of the unfunded debt has been paid off. Universal military service has been introduced, and all this has been done with far fewer difficulties than existed in any other civilized country.

Each of the financial and economic reforms described above was, of course, the subject of a separate law, but, so far as they are determined at the general settlement which takes place between Austria and Hungary every ten years, they are comprised under the expression "Ausgleich" (compact or compromise), which includes especially the determination of the Quota, and to this extent they are all dealt with together as part of a general settlement and bargain. In this settlement a concession on commercial policy would be set off against a gain on the financial agreement; e.g. in 1877 Austria gave Hungary a share in the management of the bank, while the arrangement for paying the bonus on exported sugar was favourable to Austria; on the other hand, since the increased duty on coffee and petroleum would fall more heavily on Austria, the Austrians wished to persuade the Hungarians to pay a larger quota of the common expenses, and there was also a dispute whether Hungary was partly responsible for a debt of 80 M. 

The Ausgleich with Hungary.
gulden to the bank. Each measure had, therefore, to be considered not only on its merits, but in relation to the general balance of advantage, and an amendment in one might bring about the rejection of all. The whole series of acts had to be carried in two parliaments, each open to the influence of national jealousy and race hatred in its most extreme form, so that the negotiations have been conducted under serious difficulties, and the periodical settlement has always been a time of great anxiety.

The first settlement occupied two full years, from 1876, when the negotiations began, to June 1878, when at last all the bills were carried successfully through the two parliaments; and it was necessary to prolong the previous arrangements (which expired at the end of 1877) till the middle of 1878. First the two ministries had to agree on the drafts of all the bills; then the bills had to be laid before the two parliaments. Each parliament elected a committee to consider them, and the two committees carried on long negotiations by notes supplemented by verbal discussions. Then followed the debates in the two parliaments; there was a ministerial crisis in Austria, because the House refused to accept the tax on coffee and petroleum which was recommended by the ministers, and finally a great controversy arose between the ministers with the Emperor, who determined the compromise that was at last accepted. In 1887 things went better; there was some difficulty about the tariff, especially about the tax on petroleum, but Count Taaffe had a stronger position than the Austrian ministers of 1877. Ten years later, on the third renewal, the difficulties were still greater. They sprang from a double cause. First the Austrians were determined to get a more favourable division of the common expenses; that of 1867 still continued, although Hungary had grown relatively in wealth. Moreover, a proposed alteration in the taxes on sugar would be of considerable advantage to Hungary; the Austrians, therefore, demanded that henceforward the proportion should be not 68:6:31:4 but 58:4:2. On this there was a deadlock; all through 1897 and 1908 the Quota-Deputations failed to come to an agreement. This, however, was not the worst. Parliamentary government in Austria had broken down; the opposition had recourse to obstruction, and no business could be done. Its object was to drive out the Badeni government, and for that reason the obstruction was chiefly directed against the renewal of the Ausgleich; for, as this was the first necessity of state, no government could remain in office which failed to carry it through. The extreme parties of the Germans and the anti-Semites were also, for racial reasons, opposed to the whole system. When, therefore, the government at the end of 1897 introduced the necessary measures for prolonging the existing arrangements provisionally till the differences with Hungary had been settled, scenes of great disorder ensued, and at the end of the year the financial arrangements had not been prolonged, and neither the bank charter nor the Customs Union had been renewed. The government, therefore (Badeni having resigned), had to proclaim the necessary measures by imperial warrant. Next year it was even worse, for there was obstruction in Hungary as well as in Austria; the Quota-Deputations again came to no agreement, and the proposals for the renewal of the Bank charter, the reform of the currency, the renewal of the Customs Union, and the new taxes on beer and brandy, which were laid before parliament both at Vienna and Pest, were not carried in either country; this, therefore, the existing arrangements had to be prolonged provisionally by imperial and royal warrant both in Austria and Hungary. During 1899 parliamentary peace was restored in Hungary by the resignation of Bánffy; in Austria, however, though there was again a change of ministry the only result was that the Czechs imitated the example of the Germans and resorted to obstruction so that still no business could be done. The Austrian ministry, therefore, came to an agreement with the Hungarians that the terms of the new Ausgleich should be finally proclaimed in Austria by imperial warrant; the Hungarians only giving their assent to this in return for considerable financial advantages.

The main points of the agreement were: (1) the Bank charter was to be renewed till 1916, the Hungarians receiving a larger share in the direction than they had hitherto enjoyed; (2) the Customs Union so far as it was based on a reciprocal and binding agreement was to continue, but extending it, continuing it in practice, and promising to do so until the 31st of December 1901 negotiations were to be begun for a renewal of the alliance, and if possible it was to be renewed from the year 1903, in which case all the commercial concessions would expire. If this were done, then the tariff would be prolonged before any fresh commercial law were made. If it were not done, then no fresh treaties would be made extending beyond the year 1907, so that if the Commercial Union of Austria and Hungary were not renewed before 1907, each party would be able to determine its own policy unshackled by any previous treaties. These arrangements in Hungary received the sanction of the parliament; but this could not be procured in Austria, and they were, therefore, proclaimed by imperial warrant; first of all, on 20 July, the new duties on beer, brandy and sugar; then on 23 September the Bank charter, &c. In November the Quota-Deputations at last agreed that Hungary should henceforward pay 33¢, a very small increase, and this was also in Austria proclaimed in 1907, so that a working agreement was made, by which the Union was preserved.

Since the years 1866-1871 no period of Austro-Hungarian development has been so important as the years 1903-1907. The defeat of the old Austria by Prussia at Sadowa in 1866, the establishment of the Dual Monarchy in 1867 and the foundation of the new German empire in 1871, formed the starting-point of Austro-Hungarian history properly so called; but the Austro-Hungarian crisis of 1903-1906—a crisis temporarily settled but not definitively solved,—and the introduction of universal suffrage in Austria, discredited the original interpretation of the dual system and raised the question whether it represented the permanent form of the Austro-Hungarian polity.

At the close of the 19th century both states of the Dual Monarchy were visited by political crises of some severity. Parliamentary life in Austria was paralysed by the feud between Germans and Czechs that resulted directly from the Badeni language ordinances of 1897 and indirectly from the development of Slav influence, particularly that of Czechs and Poles during the Taaffe era (1897). The renewal in Austria was carried on by cabinets of officials with the concurrence of the emperor (paragraph 14) of the constitution. Ministers, nominally responsible to parliament, were in practice responsible only to the emperor. Thus during the closing years of last and the opening years of the present century, political life in Austria was at a low ebb and the constitution was observed in the letter rather than in spirit. Hungary was apparently better situated. Despite the campaign of obstruction that overthrew the Bánffy and led to the formation of the Széll cabinet in 1899, the hegemony of the Liberal party which, under various names, had been the mainstay of dualism since 1867, appeared to be unshaken. But clear signs of the decay of the dualist and of the growth of an extreme nationalist Magyar spirit were already visible. The Army bills of 1889, which involved an increase of the peace footing of the joint Austro-Hungarian army, had been carried with difficulty, though due to the efforts of Koloman Tisza and of Count Julius Andrásy the Eld. De, this tending to render the Magyarization of the joint army had been advertised and had found such an echo in Hungarian public opinion that Count Andrásy was obliged solemnly to warn the country of the dangers of nationalist Chauvinism and to remind it of its obligations under the Compact of 1867. The struggle over the civil marriage and divorce laws that filled the greater part of the nineties served and was perhaps intended by the Liberal leaders to serve as a diversion in favour of the Liberal-dualist standpoint; nevertheless, Nationalist feeling found strong expression during the negotiations of Bánffy and Széll with various Austrian premiers for the renewal of the economic Ausgleich, or "Customs and Trade Alliance." At the end of 1902 the Hungarian premier, Széll, concluded with the Austrian premier, Körber, a new customs and trade alliance
comprising a joint Austro-Hungarian tariff as a basis for the negotiation of new commercial treaties with Germany, Italy and other states. This arrangement, which for reasons of brevity will henceforth be referred to as the Széll-Körber Compact, was destined to play an important part in the history of the next few years, though it was never fully ratified by either parliament and was ultimately discarded. Its conclusion was prematurely greeted as the end of a period of economic strife between the two halves of the monarchy and as a pledge of a decade of peaceful development. Events were soon to demonstrate the baselessness of these hopes.

In the autumn of 1902 the Austrian and the Hungarian governments, at the instance of the crown and in agreement with the joint minister for war and the Austrian and Hungarian ministers for national defence, laid before their respective parliaments bills providing for an increase of 21,000 men in the annual contingents of recruits. 16,700 men were needed for the joint army, and the remainder for the Austrian and Hungarian national defence troops (Landwehr and honvéd). The total contribution of Hungary would have been some 6,500 and of Austria some 14,500 men. The military authorities made, however, the mistake of detailing the annual conscription of supernumerary recruits (i.e. recruits liable to military service but in excess of the annual 103,000 enrolleable by law) pending the adoption of the Army bills by the two parliaments. The object of this apparently high-handed step was to avoid the expense and delay of summoning the supernumeraries again to the colours when the bills should have received parliamentary sanction; but it was not unnaturally resented by the Hungarian Chamber, which has ever possessed a lively sense of its prerogatives. The Opposition, consisting chiefly of the independence party led by Francis Kossuth (eldest son of Louis Kossuth), made capital out of the grievance and decided to obstruct ministerial measures until the supernumeraries should be discharged. The estimates could not be sanctioned, and though Kossuth granted the Széll cabinet a vote on account for the first four months of 1903, the Government found itself at the mercy of the Opposition. At the end of 1902 the supernumeraries were discharged—too late to calm the ardour of the Opposition, which proceeded to demand that the Army bills should be entirely withdrawn or that, if adopted, the annual conscription of supernumerary recruits (i.e. the Magyar nationalist feeling calculated to promote the use of the Magyar language in the Hungarian part of the army and to render the Hungarian regiments, few of which are purely Magyar, more and more Magyar in character. Széll, who vainly admired the crown and the military authorities to make timely concessions, was obliged to reject these demands which enjoyed the secret support of Count Albert Apponyi, the Liberal president of the Chamber and of his adherents. The obstruction of the estimates continued. On the 1st of May the Széll cabinet found itself without supply and governed for a time "ex-lex"; Széll, who had lost the confidence of the crown, resigned and was succeeded (June 26) by Count Khuen-Héderváry, previously ban, or governor, of Croatia. Before taking office Khuen-Héderváry negotiated with Kossuth and other Opposition leaders, who undertook that obstruction should cease if the Army bills were withdrawn. Despite the fact that the Austrian Army bill had been voted by the Reichsrath (February 10), the crown consented to withdraw the bills and thus compelled the Austrian parliament to repeal, the bill which in the quarrel between Magyars and Magyar nationalists, what it regarded as a patriotic measure. Austrian feeling became embittered towards Hungary and the action of the crown was openly criticized.

Meanwhile the Hungarian Opposition broke its engagement. Obstruction was continued by a section of the independence party; and Kossuth, seeing his authority ignored, resigned the leadership. The obstructionists now raised the cry that the German words of command in the joint army must be replaced by Magyar words in the regiments recruited from Hungary—a demand which, apart from its disintegrating influence on the army, the crown considered to be an encroachment upon the royal military prerogatives as defined by the Hungarian Fundamental Law XLI. of 1867. Clause 12 of the law runs:—"In pursuance of the constitutional military prerogatives of His Majesty, every thing relating to the unitary direction, leadership and inner organization of the whole army, and thus also of the Hungarian army as a complementary part of the whole army, is recognized as subject to His Majesty's disposal." The cry for the Magyar words of command on which the subsequent constitutional crisis turned, was tantamount to a demand that the monarch should differentiate the Hungarian from the Austrian part of the joint army, and should render it impossible for any but Magyar officers to command Hungarian regiments, less than half of which have a majority of Magyar recruits. The partisans of the Magyar words of command based their claim upon clause 12 of the Fundamental Law XII. of 1867—which runs:—"Nevertheless the country reserves its right periodically to complete the Hungarian army and the right of granting recruits, the fixing of the conditions on which the recruits are granted, the fixing of the term of service and all the dispositions concerning the stationing and the supplies of the troops according to existing law both as regards legislation and administration." Since 1876 the Government has been in the habit of granting recruits which, if the words of command should be Magyar, will be granted, the partisans of the Magyar words of command argued that the abolition of the German words of command in the Hungarian regiments might be made such a condition, despite the enumeration in the preceding clause 11, of everything appertaining to the unitary leadership and inner organization of the joint Austro-Hungarian army as belonging to the constitutional military prerogatives of the crown. Practically, the dispute was a trial of strength between Magyar nationalist feeling and the crown. Austrian feeling strongly supported the monarch in his determination to defend the unity of the army, and the conflict gradually acquired an intensity that appeared to threaten the very existence of the dual system.

When Count Khuen-Héderváry took office and Kossuth relinquished the leadership of the independence party, the extension of the crisis could not be foreseen. A few extreme nationalists continued to obstruct the estimates, and it appeared as though their energy would soon flag. An attempt to quicken this process by bribery provoked, however, an outburst of feeling against Khuen-Héderváry, who, though prominent in the cabinets and who found his position shaken. Shortly afterwards Magyar resentment of an army order issued from the cavalry manuveres at Chlapy in Galicia—in which the monarch declared that he would "hold fast to the existing and well-tried organization of the army" and would never "relinquish the rights and privileges guaranteed to its highest war-lord"; and of a provocative utterance of the Austrian premier Körber in the Reichsrath led to the overthrow of the Khuen-Héderváry cabinet (September 30) by an immense majority. The cabinet fell on a motion of censure brought forward by Kossuth, who had profited by the bribery incident to resume the leadership of his party.

An interval of negotiation between the crown and many leading Magyar Liberals followed, until at the end of October 1903 Count Stephen Tisza, son of Koloman Tisza, accepted a mission to form a cabinet after all others had declined.

As programme Tisza brought with him a number of concessions from the crown to Magyar nationalist feeling in regard to military matters, particularly in regard to military service. By an innovation, the transfer of officers of Hungarian origin from Austrian to Hungarian regiments, the establishment of military scholarships for Magyar youths and the introduction of the two years' service system. In regard to the military language, the Tisza programme—which, having been drafted by a committee of nine members, is known as the "programme of the nine"—declared that the responsibility of the cabinet extends to the military prerogatives of the crown, and that "the legal influence of parliament exists in this respect as in respect of every constitutional right." The programme, however, expressly excluded for "weighty political reasons affecting great interests of the nation" the question of the military
AUSTRIA-HUNGARY

language; and on Tisza’s motion the Liberal party adopted an addendum, sanctioned by the crown; “the party maintains the standpoint that the king has a right to fix the language of service and command in the Hungarian army on the basis of his constitutional prerogatives as recognized in clause r of law XII of 1867.”

Notwithstanding the concessions, obstruction was continued by the Clericals and the extreme Independents, partly in the hope of compelling the crown to grant the Magyar words of command and partly out of antipathy towards the person of the young Calvinist premier. In March 1904, Tisza, therefore, introduced a drastic “guillotine” motion to amend the standing orders of the House, but withdrew it in return for undertaking from the Opposition that obstruction would cease. This time the Opposition kept its word. The Recruits’ Bill and the estimates were adopted, the Delegations were enabled to meet at Budapest—where they voted £22,000,000 as extraordinary estimates for the army and navy and especially for the renewal of the field artillery—and the negotiations for new commercial treaties with Germany and Italy were sanctioned, although Parliament had never been able to ratify the Széll-Körber compact with the tariff on the basis of which the negotiations were conducted. But when the moment arrived, Tisza foresees a new campaign of obstruction, and resolved to revert to his drastic reform of the standing orders. The announcement of his determination caused the Opposition to rally against him, and when on the 18th of November the Liberal party adopted a “guillotine” motion by a show of hands in defiance of orthodox procedure, a section of the party seceded. On the 13th of December the Opposition, infuriated by the formation of a special corps of parliamentary constables, invaded and wrecked the Chamber. Tisza appealed to the country and suffered, on the 26th of January 1905, an overwhelming defeat at the hands of a coalition composed of dissentient Liberals, Clericals, Independents, and a few Bánffyites. The Coalition gained an absolute majority and the Independence party became the strongest political group. Nevertheless the various adherents of the dual system retained an actual majority in the Chamber and prevented the Independence party from attempting to realize its programme of reducing the ties between Hungary and Austria to the person of the Emperor. The management of the country after the defeat, Count Tisza had signed on behalf of Hungary the new commercial treaties concluded by the Austro-Hungarian foreign office with Germany and Italy on the basis of the Széll-Körber tariff. He acted ultra vires, but by his act saved Hungary from a severe economic crisis and retained for her the right to benefit by economic partnership with Austria until the expiry of the new treaties in 1917.

A deadlock, lasting from January 1905 until April 1906, ensued between the crown and Hungary and, to a great extent, between Hungary and Austria. The Coalition, though possessing the majority in the Chamber, resolved not to take office unless the crown should grant its demands, including the Magyar words of command and customs separation from Austria. The crown declined to concede these points, either of which would have wrecked the dual system as interpreted since 1867. The Tisza cabinet could not be relieved of its functions till June 1905, when it was succeeded by a non-parliamentary administration under the presidency of General Baron Fejerváry, formerly minister for national defence. Seeing that the Coalition would not take office on acceptable terms, Fejerváry obtained the consent of the crown to a scheme, drafted by Kristóföy, minister of the interior, that the dispute between the crown and the Coalition should be subjected to the test of universal suffrage and that to this end the franchise in Hungary be radically reformed. The scheme alarmed the Coalition, which saw that universal suffrage might destroy not only the hegemony of the Magyar nobility and gentry in whose hands political power was concentrated, but might, by admitting the non-Magyars to political equality with the Magyars, undermine the supremacy of the Magyar race itself. Yet the Coalition did not yield at once. Not until the Chamber had been dissolved by military force (February 19, 1906) and an open breach of the constitution seemed within sight did they come to terms with the crown and form an administration. The miserable state of public finances and the depression of trade doubtless helped to induce them to perform a duty which they ought to have performed from the first; but their chief motive was the desire to escape the menace of universal suffrage or, at least, to make sure that it would be introduced in such a form as to safeguard Magyar supremacy over the other Hungarian races.

The pact concluded (April 8, 1906) between the Coalition and the crown is known to have contained the following conditions:—

All military questions to be suspended until after the introduction of universal suffrage; the estimates and the normal contingent of recruits to be voted for 1905 and 1906; the extraordinary military credits, sanctioned by the delegations in 1904, to be voted by the Hungarian Chamber; ratification of the commercial treaties concluded by Tisza; election of the Hungarian Delegation and of the Quota-Deputation; introduction of a suffrage reform at least as far reaching as the Kristóföy scheme. These “capitulations” obliged the Coalition government to carry on a dualist policy, although the majority of adherents became, by the general elections of May 1906, members of the Independence party, and, as such, pledged to the economic and political separation of Hungary from Austria save as regards the person of the ruler. Attempts were, however, made to emphasize the independence of Hungary. During the deadlock (June 2, 1905) Kossuth had obtained the adoption of a motion to authorize the compilation of an autonomous Hungarian tariff, and on the 28th of May 1906, the Coalition cabinet was authorized by the crown to present the Széll-Körber tariff to the Chamber in the form of a Hungarian autonomous tariff distinct from but identical with the Austrian tariff. This concession of form having been made to the Magyars without the knowledge of the Austrian government, Prince Konrad Hohenlohe, the Austrian premier, resigned office; and his successor, Baron Beck, eventually (July 6) withdrew from the table of the Reichsrath the whole Széll-Körber compact, declaring that the only remaining economic ties between the two countries were freedom of trade, the commercial treaties with foreign countries, the joint state and the management of excise. If the Hungarian government wished to regulate its relationship to Austria in a more definite form, added the Austrian premier, it must conclude a new agreement before the end of the year 1907, when the reciprocity arrangement of 1899 would lapse. The Hungarian government replied that any new arrangement with Austria must be concluded in the form of a commercial treaty as between two foreign states and not in the form of a “customs and trade alliance.”

Austria ultimately consented to negotiate on this basis. In October 1907 an agreement was attained, thanks chiefly to the sobering of Hungarian opinion by a severe economic crisis, which brought out with unusual clearness the fact that separation from Austria would involve a period of distress if not of commercial ruin for Hungary. Austria also came to see that separation from Hungary would seriously enhance the cost of living in Cisleithania and would deprive Austrian manufacturers of their best market. The main principles of the new “customs and commercial treaty” were: (1) Each state to possess a separate but identical customs tariff. (2) Hungary to facilitate the establishment of direct railway communication between Vienna and Dalmatia, the communication to be established by the end of 1915, each state building the sections of line that passed through its own territory. (3) Austria to facilitate railway communication between Hungary and Prussia. (4) Hungary to reform her produce and Stock Exchange laws so as to prevent speculation in agrarian produce. (5) A court of arbitration to be established for the settlement of differences between the two states, Hungary selecting four Austrian and Austria four Hungarian judges, the presidency of the court being decided by lot, and each government being represented before the court by its own delegates. (6) Impediments
to free trade in sugar to be practically abolished. (7) Hungary

offended several of the great powers, who seemed to see in

her interest in Macedonian reforms. That Baron von Aerenthal was able to pursue a policy apparently so rash,

due to the fact that he could reckon on the support of

Germany. The intimate relations between the two powers

had been revealed during the dispute between France

and Germany about Morocco; in the critical division of the

3rd of March 1906 at the Algeciras Conference Austria-Hungary,

alone of all the powers, had sided with Germany, and it was a

proposal of the Austro-Hungarian plenipotentiary that formed

the basis of the ultimate settlement between Germany and

France (see MOROCCO: History). The cordial relations thus

emphasized encouraged Baron Aerenthal, in the autumn of

1908, to pursue a still bolder policy. The revolution in Turkey

had entirely changed the face of the Eastern Question;

the problem of Macedonian reform was swallowed up in that of

the reform of the Ottoman empire generally, there was even a

danger that a rejuvenated Turkey might in time lay claim to

the provinces occupied by Austria-Hungary under the treaty

of Berlin; in any case, the position of these provinces, governed

autonomously from Vienna, between a constitutional Turkey

and a constitutional Austria-Hungary, would have been highly

anomalous. In the circumstances Baron Aerenthal determined

on a bold policy. Without consulting the co-signatory powers

of the treaty of Berlin, and in deliberate violation of its provisions,

the king-emperor issued, on the 13th of October, a decree

annexing Bosnia and Herzegovina to the Habsburg Monarchy,

and at the same time announcing the withdrawal of the Austro-

Hungarian troops from the sanjak of Novibazar. (See EUROPE:

History.)

Meanwhile the relations between the two halves of the Dual

Monarchy had again become critical. The agreement of 1907

had been but a truce in the battle between two irreconcilable

principles: between Magyar nationalism, determined to maintain its ascendency in an independ

ent Austria-Hungary, and Habsburg imperialism, equally
determined to preserve the economic and military unity of the

Dual Monarchy. In this conflict the tactical advantage lay
with the monarchy; for the Magyars were in a minority in

Hungary, and a minority of a power which had made such a change inevitable. In March of

1908 Mr Hallo laid before the Hungarian parliament a formal

proposal that the charter of the Austro-Hungarian Bank, which

was to expire at the end of 1910, should not be renewed; and

that, in the event of failure to negotiate a convention between

the banks of Austria and Hungary, a separate Hungarian Bank

should be established. This question, obscured during the winter

by the Balkan crisis, once more became acute in the spring of

1909. In the Coalition cabinet itself opinion was sharply divided,

but in the end the views of the Independence party prevailed,

and Dr Weberle laid the proposal for a separate Hungarian

Bank before the king-emperor and the Austrian government.

Its reception was significant. The emperor Francis Joseph

pointed out that the question of a separate Bank for Hungary

1 Alois, Count Lexa von Aerenthal, was born on the 27th of

September 1854 at Gross-Skal in Bohemia, studied at Bonn

and Prague, was attached at Paris (1873) and afterwards at St Petersburg,

envoy extraordinary at Bucharest (1893) and ambassador at St

Petersburg (1896). He was created a count on the emperor's 70th

birthday in 1909.
did not figure in the act of 1867, and could not be introduced into it, especially since the capital article of the ministerial pro-
gramme, i.e. electoral reform, was not realized, nor was it
realized. This was tantamount to an appeal from the Magyar
popular to the Hungarian plebs, the disfranchised non-Magyar
majority; an appeal all the more significant from the fact that
it ignored the suffrage bill brought in on behalf of the Hungarian
government by Count Julius Andrassy in November 1908, a bill
which, under the guise of granting the principle of universal
suffrage, was ingeniously framed so as to safeguard and even
to extend Magyar ascendancy (see HUNGARY: History). In
consequence of this rebuff Dr. Wekerle tendered his resignation
on the 27th of April. Months passed without it being possible
to form a new cabinet, and a fresh period of crisis and agitation
was begun.

(W. A. P.)

II. Austria Proper since 1867.

As already explained, the name Austria is used for convenience
to designate those portions of the possessions of the house of
Habsburg, which were not included by the settlement of 1867
among the lands of the Hungarian crown. The separation of
Hungary made it necessary to find some method by which these
territories would henceforth be governed. The misfortune of the
country was that there was no legal basis on which new institutions
could be erected. Each of the territories was a separate political
unit with a separate history, and some of them had a historic claim to a large amount of self-
government; in many the old feudal estates had survived till
1848. Since that year the empire had been the subject of
numerous experiments in government; by the last, which
began in 1860, Landgau or diets have been instituted in each
of the territories on a nearly uniform system and with nearly
identical powers, and by the constitution published in February
1861 (the February Constitution, as it is called), which is still
the ultimate basis for the government, there was
instituted a Reichsrath or parliament for the whole
empire; it consisted of a House of Lords (Herren-
haus), in which sat the archbishops and prince bishops,
members of the imperial family, and other members appointed
for life, besides some hereditary members, and a Chamber of
Deputies. The members of the latter for each territory were
not chosen directly by the citizens but by the diets
themselves were elected for six years; they were chosen generally
(there were slight local differences) in the following way: (a)
a certain number of bishops and rectors of universities sat
in virtue of their office; (b) the rest of the members were chosen
by four electoral bodies or curiae,—(1) the owners of estates
which before 1848 had enjoyed certain feudal privileges, the
so-called great proprietors; (2) the chambers of commerce;
(3) the towns; (4) the rural districts. In the latter two classes
all had the suffrage who paid at least ten gulden in direct taxes.
The districts were so arranged as to give the towns a very large
representation in proportion to their populations. In Bohemia,
the diet consisted of 241 members; of these five were ex
officio members; the feudal proprietors had seventy; the
towns and chambers of commerce together had eighty-seven;
the rural districts seventy-nine. The electors in the rural
districts were 206,000, in the towns 93,000. This arrangement
seems to have been deliberately made by Schmerling, so as to
give greater power to the German inhabitants of the towns;
the votes of the proprietors would, moreover, nearly always give
the final decision to the court and the government, for the
influence exercised by the government over the nobility would
nearly always be strong enough to secure a majority in favour of
the government policy.

This constitution had failed; territories so different in size,
history and circumstances were not contented with similar
institutions, and a form of self-government which satisfied
lower Austria and Salzburg did not satisfy Galicia and Bohemia.
The Czechs of Bohemia, like the Magyars, had refused to recog-
nize the common parliament on the ground that it violated the
historic rights of the Bohemian as of the Hungarian crown,
and in 1865 the constitution of 1861 had been superseded, while
the territorial diets remained. In 1867 it was necessary once
more to summon, in some form or another, a common parliament
for the whole of Austria, by which the settlement with Hungary
could be ratified.

This necessity brought to a decisive issue the struggle between
the parties of the Centralists and Federalists. The latter
claimed that the new constitution must be made by
agreement with the territories; the former maintained
that the constitution of 1861 was still valid, and
demanded that in accordance with it the Reichsrath
should be summoned, and a "constitutional" government
restored. The difference between the two parties was to a great
extent, though not entirely, one of race. The kernel of the
empire was the purely German district, including Upper and
Lower Austria, Salzburg, Tirol (except the south) and Vorarlberg,
all Styria except the southern districts, and a large part of
Carinthia. There was strong local feeling, especially in Tirol,
but it was local feeling similar to that which formerly existed
in the provinces of France; among all classes and parties there
was great loyalty both to the ruling house and to the idea of the
Austrian state; but while the liberal party, which was dominant
in Lower Austria and Styria, desired to develop the central
institutions, there was a strong Conservative and Clerical party
which supported local institutions as a protection against the
liberal influence of a centralized parliament and bureaucracy,
and the bishops and clergy were willing to gain support in the
struggle by alliance with the Federalists.

Very different was it in the other territories where the majority
of the population was not German—and where there was a
likely recollection of the times when they were not in Austria.
With Palacky the latter exclaims: "We are not German before Austria; we shall continue to exist after it is
gone." Especially was this the case in Bohemia.

In this great country, the richest part of the Austrian dominions,
where over three-fifths of the population were Czech, racial
feeling was supported by the appeal to historic law. A great
party, led by Palacky and Rieger, demanded the restoration of
the Bohemian monarchy in its fullest extent, including Moravia
and Silesia, and insisted that the emperor should be crowned
as king of Bohemia at Prague as his predecessors had been,
and that Bohemia should have a position in the monarchy similar
to that obtained by Hungary. Not only did the party include all
the Czechs, but they were supported by many of the great
nobles who were of German descent, including Count Leo Thun,
his brother-in-law Count Heinrich Clam-Martinitz, and Prince
Friedrich von Schwarzenberg, cardinal archbishop of Prague,
who hoped in a self-governing kingdom of Bohemia to preserve
that power which was threatened by the German Liberals.
The feudal nobles had great power arising from their wealth,
the great traditions of their families, and the connexion with the
court, and by the electoral law they had a large number of
representatives in the diet. On the other hand the Germans of
Bohemia, fearful of falling under the control of the Czechs,
were the most ardent advocates of centralization. The
Czechs were supported also by their fellow-countrymen in Moravia,
and some of the nobles, headed by Count Belcredi, brother of
the minister; but in Brunn there was a strong German party.
In Silesia the Germans had a considerable majority, and as
there was a large Polish element which did not support the Czechs, the diet refused to recognize the claims of the Bohemians. The Poles of Galicia stood apart from the other Slav races. The German-speaking population was very small, consisting chiefly of government officials, railway servants and Jews; but there was a large minority (some 43%) of Ruthenians. The Poles wished to gain as much autonomy as they could for their own province, but they had no interest in opposing the centralization of other parts; they were satisfied if Austria would surrender the Ruthenians to them. They were little influenced by the pan-Slav agitation; it was desirable for them that Austria, which gave them freedom and power, should continue strong and united. Their real interests were outside the monarchy, and they did not cease to look forward to a restoration of the Polish kingdom. The great danger was that they might entangle Austria in a war with Russia.

The southern Slavs had neither the unity, nor the organization, nor the historical traditions of the Czechs and Poles; but the Slovenes, who formed a large majority of the population in Carniola, and a considerable minority in the adjoining territory of Gorizia, wished the southern Slav districts to be formed into a single Slav nation, and a Slav language should be used for purposes of government and education. Their political ideal was an "Illyrian" kingdom, including Croatia and all the southern Slavs in the coast district, and a not very successful movement had been started to establish a so-called Illyrian language, which should be accepted by both Croats and Slovenes. There was, however, another element in the southern districts, viz. the Serbs, who, though of the same race and language as the Croats, were separated from them by religion. Belonging to the Orthodox Church they were attracted by Russia. They were in constant communication with Servia and Montenegro; and their ultimate hope, the creation of a great Servian kingdom, was less easy to reconcile with loyalty to Austria. Of late years attempts have been made to turn the Slovenian national movement into this direction, and to attract the Slovenes also towards the Orthodox non-Austrian Slavs.

In the extreme south of Dalmatia is a small district which had not formed part of the older duchy of Dalmatia, and had not been joined to the Austrian empire till 1814; in former years part of it formed the republic of Ragusa, and the rest belonged to Albania. The inhabitants of this part, who chiefly belonged to the Greek Church, still kept up a close connexion with Albania and with Montenegro, and Austrian authority was maintained in it only by the barest and most inadequate force once before; and in 1869 another outbreak took place. This district had hitherto been exempted from military service; by the law of 1869, which introduced universal military service, those who had hitherto been exempted were required to serve, not in the regular army but in the militia. The inhabitants of the district round the Bocche di Cattaro (the Bocchesi, as they are commonly called) refused to obey this order, and when a military force was sent it failed to overcome their resistance; and by an agreement made at Knezlic in December 1869, Rodica, who had taken command, granted the insurgents all they asked and a complete amnesty. After the contest of Bosnia another attempt was made to enforce military service; once more a rebellion broke out, and spread to the contiguous territory of Montenegro. The Austrian govern- ment, whose position in the Balkans had been much strengthened by the occupation of the new provinces, did not fail to act with decision. A considerable force was sent under General Baron Stephan Rodics, who, on the terms of duality was directly opposed to the ambitions of the Slavs and the Federalists. Belcredi, who had come into power in 1865 as a Federalist and had suspended the constitution of 1857 on the 2nd of January 1867, ordered new elections for the diets, which were then to elect deputies to an extraordinary Reichsrath which should consider the Ausgleich, or compact with Hungary. The wording of the decree implied that the February constitution did not exist as of law; the Germans and Liberals, strenuously objecting to a "feudal-federal" constitution which would give the Slavs a preponderance in the empire, maintained that the February constitution was still in force, and that changes could only be introduced by a regular Reichsrath summoned in accordance with it, protested against the decree, and, in some cases, threatened not to take part in the elections. As the Federalists...
were all opposed to the Ausgleich, it was clear that a Reichsrath chosen in these circumstances would refuse to ratify it, and this was probably Belcredi’s intention. As the existence of the empire would thereby be endangered, Beust interfered; Belcredi was dismissed, Beust himself became minister-president on the 7th of February 1867, and a new edict was issued from Vienna ordering the diets to elect a Reichsrath, according to the constitution, which was now said to be completely valid. Of course, however, those diets in which there was a Federalist majority, viz. those of Bohemia, Moravia, Carinthia and Tirol, which were already pledged to support the January policy of the government, did not acquiesce in the February policy; and they refused to elect except on terms which the government could not accept. The first three were immediately dissolved. In the elections which followed in Bohemia the influence of the government was sufficient to secure a German majority among the landed proprietors; the Czechs, who were therefore in a minority, declared the elections invalid, refused to take any part in electing deputies for the Reichsrath, and seceded altogether from the diet. The result was that Bohemia now sent a large German majority to Vienna, and the few Czechs who were chosen refused to take their seat in the Reichsrath. Had the example of the Czechs been followed by the other Slav races it would still have been difficult to get together a Reichsrath to pass the Ausgleich. It was, however, easier to deal with the Poles of Galicia, for they had no historical rights to defend; and by sending delegates to Vienna they would not sacrifice any principle or prejudice any legal claim; they had only to consider how they could make the best bargain. Their position was a strong one; their votes were essential to the government, and the government could be useful to them; it could give them the complete control over the Ruthenes. A compact then was easily arranged.

Beust promised them that there should be a special minister for Galicia, a separate board for Galician education, that Polish should be the language of instruction in all secondary schools, that Polish instead of German should be the official language in the law courts and public offices, Ruthenian being only used in the elementary schools under strict limitations. On these terms the Polish deputies, led by Ziemialkowski, agreed to go to Vienna and vote for the Ausgleich.

When the Reichsrath met, the government had a large majority; and in the House, in which all the races except the Czechs were represented, the Ausgleich was ratified almost unanimously. This having been done, it was possible to proceed to special legislation for the territories, which were henceforward officially known as “the kingdoms and lands represented in the Reichsrath.”

A series of fundamental laws were carried, which formally established parliamentary government, with responsibility of ministers, and complete control over the budget, and there were included a number of clauses guaranteeing personal rights and liberties in the way common to all modern constitutions. The influence of the Poles was still sufficient to secure considerable concessions to the wishes of the Federalists, since if they did not get what they wished they would leave the House, and the Slavs were threatened with this.

Hence the German Liberals were prevented from introducing direct elections to the Reichsrath, and the functions of the Reichsrath were slightly less extensive than they had hitherto been. Moreover, the Delegation was to be chosen not by the House as a whole, but by the representatives of the separate territories. This is one reason for the comparative weakness of Austria as compared with Hungary, where the Delegation is elected by each House as a whole; the Bohemian representatives, e.g., meet and choose 10 delegates, the Galicians, 7, those from Trieste 1; the Delegation, is, therefore, not representative of the majority of the chamber of deputies, but includes representatives of all the groups which may be opposing the government there, and they can carry on their opposition even in the Delegation. So it came about in 1866, that on the first occasion when there was a joint sitting of the Delegations to settle a point in the budget, which Hungary had accepted and Austria rejected, the Poles and Tirolese voted in favour of the Hungarian proposal.

As soon as these laws had been carried (December 1867), Beust retired from the post of minister-president, and in accordance with constitutional practice a parliamentary ministry was appointed entirely from the ranks of the Liberal majority; a ministry generally known as the “Bürger Ministerium” in which Giska and Herbst—the leaders of the German party in Moravia and Bohemia—were the most important members. Austria now began its new life as a modern constitutional state. From this time the maintenance of the revised constitution of 1867 has been the watchword of what is called the Constitutional party. The first use which the new government made of their power was to settle the finances, and in this their best work was done. Among them were nearly all the representatives of trade and industry, of commercial enterprise and financial speculation; they were the men who hoped to make Austria a great industrial state, and at this time they were much occupied with railway enterprise. Convinced free-traders, they hoped by private energy to build up the fortunes of the country, parliamentary opposition for them the rule of the educated and well-to-do middle class—being one of the means to this end. They accepted the great burden of debt which the action of Hungary imposed upon the country, and rejected the proposals for repudiation, but notwithstanding the protest of foreign bondholders they imposed a tax of 16% on all interest on the debt. They carried out an extension of the commercial treaty with Great Britain by which a further advance was made in the direction of free trade.

Of equal importance was their work in freeing Austria from the control of the Church, which checked the intellectual life of the people. The concordat of 1855 had given the Church complete freedom in the management of all ecclesiastical affairs; there was full liberty of intercourse course with Rome, the state gave up all control over the appointment of the clergy, and in matters of church discipline the civil courts had no voice—the clergy being absolutely subject to the power of the bishops, who could impose temporal as well as spiritual penalties. The state had even resigned to the Church all authority over some departments of civil life, and restored the authority of the canon law. This was the case as regards marriage; all disputes were to be tried before ecclesiastical courts, and the marriage registers were kept by the priests. All the schools were under the control of the Church; the bishops could forbid the use of books prejudicial to religion; in elementary schools all teachers were subject to the inspection of the Church, and in higher schools only Roman Catholics could be appointed. It had been agreed that the whole education of the Roman Catholic youth, in all schools, private as well as public, should be in accordance with the teaching of the Roman Catholic Church. The authority of the Church extended even to the universities. Some change in this system was essential; the Liberal party demanded that the government should simply state that the concordat had ceased to exist. To this, however, the emperor would not assent, and there was a difficulty in over-throwing an act which took the form of a treaty. The government submitted to some agreement by friendly discussion with Rome, but Pius IX, was not willing to abate anything of his full claims. The ministry, therefore, proceeded by internal legislation, and in 1868 introduced three laws: (1) a marriage law transferred the decisions on all questions of marriage from the ecclesiastical to the civil courts, abolished the authority of the canon law, and introduced civil marriage in those cases where the clergy refused to perform the ceremony; (2) the control of secular education was taken from the Church, and the management of schools transferred to local authorities which were to be created by the diets; (3) complete civil equality between Catholics and non-Catholics was established. These laws were carried through both Houses in May amid almost unparalleled excitement, and at once received the imperial sanction, notwithstanding the protest of all the bishops, led by Joseph Othmar
AUSTRIA-HUNGARY

von Rauscher (1797-1875), cardinal archbishop of Vienna, who had earned his red hat by the share he had taken in arranging the concordat of 1856, and now attempted to use his great personal influence with the emperor (his former pupil) to defeat the bill. The ministry had the enthusiastic support of the German population in the towns. They were also supported by the teaching profession, which desired emancipation from ecclesiastical control, and hoped that German schools and German railways were to complete the work which Joseph II. had begun. But the hostility of the Church was dangerous. The pope, in an allocution, made no declaration of papal infallibility. But the declaration of 22 June 1868, declared that these “damnable and abominable laws” were contrary to the Concordat, to the laws of the Church and to the principles of Christianity,” were “absolutely and for ever null and void.” The natural result was that when they were carried into effect the bishops in many cases refused to obey. They claimed that the laws were inconsistent with the Concordat, that the Concordat still was in force, and that the laws were consequently invalid. The argument was forcible, but the courts decided against them. Rudigier, bishop of Linz, was summoned to a criminal court for disturbing the public peace; he refused to appear, for by the concordat bishops were not subject to temporal jurisdiction; and when this was admitted by the court, he was not, however, once telegraphed his full pardon. In the rural districts the clergy had much influence; they were supported by the peasants, and the diets of Tirol and Vorarlberg, where there was a clerical majority, refused to carry out the school law.

On the proclamation of papal infallibility in 1870, the government took the opportunity of declaring that the Concordat had lapsed, on the ground that there was a fundamental change in the character of the papacy. Nearly all the Austrian prelates had been opposed to the Concordat, and had opposed it to the end of the council and voted against it, and they only declared their submission with great reluctance. The Old Catholic movement, however, never made much progress in Austria. Laws regulating the position of the Church came into force in 1874. For the concordat see Laveleye, La Prise et l'Autsiche, Paris, 1870.

During 1868 the subscription was again to attack on two sides, for the nationalist movement was gaining ground in Bohemia and Galicia. In Galicia the extreme party, headed by Smolka, had always desired to imitate the Czechs and not attend at Vienna; they were outvoted, but all parties agreed on a declaration in which the final demands of the Poles were drawn up; they asked that the powers of the Galician diet should be much increased, and that the members from Galicia should cease to attend the Reichsrath on the discussion of those matters with which the Galician diet should be qualified to deal. If these demands were not granted they would leave the Reichsrath. In Bohemia the Czechs were very active; while the Poles were parading their hostility to Russia in such a manner as to cause the emperor to avoid visiting Galicia, some of the Czech leaders attended a Slav demonstration at Moscow, and in 1868 they drew up and presented to the diet at Prague a “declaration” which has since been regarded as the official statement of their claims. They asked for the full restoration of the Bohemian kingdom; they contended that no foreign assembly was qualified to impose taxes in Bohemia; that the diet was not qualified to elect representatives to go to Vienna, and that a separate settlement must be made in Bohemia with Hungary. This declaration was signed by eighty-one members, and by many of the feudal nobles and bishops. The German majority declared that they had forfeited their seats, and ordered new elections. The agitation spread over the country. Serious riots took place, and with a view to keeping order the government decreed exceptional laws. Similar events happened in Moravia, and in Dalmatia the revolt broke out among the Croats.

Before the combination of Clericals and Federalists the ministry broke down; they were divided among themselves; Counts Taaffe and Alfred Potocki, the minister of agriculture, wished to conciliate the Slav races—a policy recommended by Beust, probably with the sympathy of the emperor; the others determined to cripple the opposition by taking away the elections for the Reichsrath from the diets of Tyrol and Carinthia, and the majority of the Diet of Vorarlberg. The ministry resigned in January 1870, but the majority did not last long. In March, after long delay, the new Galician demands were definitely rejected; the whole of the Polish club, followed by the Tirolese and Slovenes, left the House, which consequently consisted of 110 members—the Germans and German representatives from Bohemia and Moravia. It was clearly impossible to govern with such a parliament. Not four years had gone by, and the new constitution seemed to have failed like the old one. The only thing to do was to attempt a reconciliation with the Slavs. The ministry resigned, and Potocki and Taaffe formed a government with this object. Potocki, now minister-president, then entered on negotiations, hoping to persuade the Czechs to accept the constitution. Rieger and Thun were summoned to Vienna; he himself went to Prague, but after two days he had to give up the attempt in despair. Feudals and Czechs all supported the declaration of 1868, and would accept no compromise, and he returned to Vienna after what was the greatest disappointment of his life. Government, however, had to be carried on; the elections demanded by the glove were held in July, and Austria might be drawn into it; the emperor could not let such a crisis alienate either the Germans or the Slavs. The Reichsrath and all the diets were dissolved. This time in Bohemia the Czechs, supported by the Feudals and the Clericals, gained a large majority; they took their seats in the diet only to declare that they did not regard it as the legal representative of the Bohemian kingdom, but merely an informal assembly, and refused to elect delegates for the Reichsrath. The Germans in their turn now left the diet, and the Czechs voted an address to the crown, drawn up by Count Thun, demanding the restoration of the Bohemian kingdom. When the Reichsrath met there were present only 130 out of 203 members, for the whole Bohemian contingent was absent; the government then, under a law of 1868, ordered that as the Bohemian diet had sent no delegates, they were to be chosen directly from the people. Twenty-four Constitutionalists and thirty Declarandien were chosen; the latter, of course, did not go to Vienna, but the additional twenty-four made a working majority by which the government was carried on for the rest of the year.

But Potocki’s influence was gone, and when the European crisis was over, in February 1871, the emperor appointed a ministry chosen not from the Liberals but from the Feudalists and Clericals, led by Count Hohenwart and A. E. F. Schäffe, a professor at the university of Vienna, chiefly known for his writings on political economy. They attempted to solve the problem by granting to the Federalists all their demands. So long as parliament was sitting they were kept in check; as soon as it had voted supplies and the Delegations had separated, they ordered new elections in all those diets where there was a Liberal majority. By the help of the Clericals they won enough seats to put the Liberals in a minority in the Reichsrath, and it would be possible to revise the constitution if the Czechs consented to come. They would only attend, however, on their own terms, which were a complete recognition by the government of the claims made in the Declaration. This was agreed to; and on the 12th of September at the opening of the diet, the governor read a royal message recognizing the separate existence of the Bohemian kingdom, and the emperor called upon them to meet the emperor at Prague. It was received with delight throughout Bohemia, and the Czechs drew a draft constitution of fundamental rights. On this the Germans, now that they were in a minority, left the diet, and began preparations for resistance. In Upper Austria, Moravia and Carinthia, where they were outvoted by the Clericals, they seceded, and the whole work of 1867 was on the point of being overthrown. Were the movement not stopped the constitution would be superseded, and the union with Hungary endangered. Beust and Andrássy warned the emperor of the danger, and the crown prince of Saxony was summoned

[^1]: The documents are printed in Baron de Worms, op. cit.
[^2]: It is printed in the Europäischer Geschichtskalender (1868).
by Beust to remonstrate with him. A great council was called at Vienna (October 20), at which the emperor gave his decision that the Bohemian demands could not be accepted. The Czechs must come to Vienna, and consider a revision of the constitution in a constitutional manner. Hohenwart resigned, but at the same time Beust was dismissed, and a new cabinet was chosen once more from among the German Liberals, under the leadership of Prince Adolf Auerperg, whose brother Carlos had been one of the chief members in the Bürger Ministerium. For the second time in four years the policy of the government had completely changed within a few months. On 12th September the decree had been published accepting the Bohemian claims, before the end of the year copies of it were seized by the police, and men were thrown into prison for circulating it.

Auerperg's ministry held office for eight years. They began as had the Bürger Ministerium, with a vigorous Liberal centralizing policy. In Bohemia they succeeded at first in almost crushing the opposition. In 1872 the diet was dissolved; and the whole influence of the government was used to procure a German majority. Koller, the governor, acted with great vigour. Opposition newspapers were suppressed; cases in which Czech journalists were concerned were transferred to the German districts, so that they were tried by a hostile German jury. Czech manifestes were confiscated, and meetings stopped at the slightest appearance of disorder; and the riots were punished by quartering soldiers upon the inhabitants. The decision between the two races turned on the vote of the feudal proprietors, and in order to win this a society was formed among the German capitalists of Vienna (to which the name of Cha!brus was popularly given) to acquire by real or fictitious purchase portions of those estates to which a vote was attached. These measures were successful: a large German majoriy was secured; Jews from Vienna sat in the place of the Thuns and the Schwarzenbergs; and as for many years the Czechs refused to sit in the diet, the government could be carried on without difficulty. A still greater blow to the Federalists was the passing of a new electoral law in 1873. The measure transferred the right of electing members of the Reichsrath from the diets to the direct vote of the people, the result being to deprive the Federalists of their chief weapon; it was no longer possible to take a formal vote of the legal representatives in any territory refusing to appoint deputies, and if a Czech or Slonevian member did not take his seat the only result was that a single constituency was unrepresented, and the opposition was actually increased. A petition with 250,000 names was presented from Bohemia, and the Poles withdrew from the Reichsrath when the law was introduced. But enough members remained to give the legal quorum, and it was carried by 1 to 2 votes. At the same time the number of members was increased to 353, but the proportion of representatives from the different territories was maintained and the system of election was not altered. The proportion of members assigned to the towns was increased, the special representatives of the chamber of commerce and of the landed proprietors were retained, and the suffrage was not extended.

The artificial system which gave to the Germans a parliamentary majority continued.

At this time the Czechs were much weakened by quarrels among themselves. A new party had arisen, calling themselves Radicals, but generally known as the Young Czechs. They disliked the alliance with the aristocracy and the clergy; they wished for universal suffrage, and recalled the Hussite traditions. They desired to take their seats in the diet, and to join with the Germans in political reform. They violently attacked Rieger, the leader of the Old Czechs, who maintained the alliance with the Federalists and the policy of passive opposition. Twenty-seven members of the diet led by Gregor and Stadkowski, being outvoted in the Czech Club, resigned their seats. They were completely defeated in the elections which followed, but for the next four years the two parties among the Czechs were as much occupied in opposing one another as in opposing the Germans. These events might have secured the predominance of the Liberals for many years. The election after the reform bill gave them an increased majority in the Reichsrath. Forty-two Czechs who had won seats did not attend; forty-three Poles stood aloof from all party combination, giving their votes on each occasion as the interest of their country seemed to require; the real opposition was limited to forty Clericals and representatives of the other Slav races, who were collected on the Right under the leadership of Hohenwart. Against them were 227 Constitutionalists, and it seemed to matter little that they were divided into three groups; there were 105 in the Liberal Club under the leadership of Herbst, 57 Constitutionalists, elected by the landed proprietors, and a third body of Radicals, some of whom were more democratic than the old Constitutional party, while others laid more stress on nationality. They used their majoriy to carry a number of important laws regarding ecclesiastical affairs. Yet within four years the government was obliged to turn for support to the Federalists and Clericals, and the rule of the German Liberals was overthrown. Their influence was indirectly affected by the great commercial crisis of 1873. For some years there had been active speculations on the Stock Exchange; a great number of companies, chiefly banks and building societies, had been founded on a very insecure basis. The inevitable crisis began in 1872; it was postponed until 1873, so that the Exhibition, fixed for 1873, would bring fresh prosperity; the hope was not, however, fulfilled, and the final crash, which occurred in May, brought with it the collapse of hundreds of undertakings. The loss fell almost entirely on those who had attempted to increase their wealth by speculative investment. Sound industrial concerns were little touched by it, but speculation had become so general that every class of society was affected, and in the investigation which followed it became apparent that some of the most distinguished members of the governing Liberal party, including at least two members of the government, were among those who had profited by the unsound finance. It appeared also that many of the leading newspapers of Vienna, by which the Liberal party was supported, had received money from financiers. For the next two years political interest was transferred from parliament to the law courts, in which financial scandals were exposed, and the reputations of some of the leading politicians were destroyed.

This was to bring about a reaction against the economic doctrines which had held the field for nearly twenty years; but the effect was not that the government was for some time. What ruined the government was the want of unity in the party, and their neglect to support a ministry which had been taken from their own ranks.

In a country like Austria, in which a mistaken foreign policy or a serious quarrel with Hungary might bring about the disruption of the monarchy, parliamentary government was impossible unless the party which the government helped in internal matters were prepared to support it in foreign affairs and in the commercial policy bound up with the settlement with Hungary. This the constitutional parties did not do. During discussions on the economic arrangement with Hungary in 1877 a large number voted against the duties on coffee and petroleum, which were an essential part of the agreement; they demanded, moreover, that the treaty of Berlin should be laid before the House, and 112 members, led by Herbst, gave a vote hostile to some of its provisions, and in the Delegation refused the supplies necessary for the occupation of Bosnia. They doubtless were acting in accordance with their principles, but the situation was such that it would have been impossible to carry their wishes; the only Austrian ministers and Andhrá had to turn for help to the Poles, who began to acquire the position of a government party, which they have kept since then.

At the beginning of 1879 Auerperg's resignation, which had long been offered, was accepted. The constitutionalists remained...
in power; but in the reconstructed cabinet, though Stremayr was president, Count Taaffe, as minister of the interior, was the most important member.

Parliament was dissolved in the summer, and Taaffe, by private negotiations, first of all persuaded the Bohemian feudal proprietors to give the Feudalists, who had long been excluded, a certain number of seats; secondly, he succeeded where Potocki had failed, and came to an agreement with the Czechs; they had already, in 1878, taken their seats in the diet at Prague, and now gave up the policy of "passive resistance," and consented to take their seats also in the parliament at Vienna.

On entering the House they took the oath without reservation, but in the speech from the throne the emperor himself stated that they had entered without prejudice to their convictions, and on the first day of the session Rieger read a formal reservation of right. The Liberals had also lost many seats, so that the House now had a completely different aspect; the constitutionalists were reduced to 97 Liberals and 54 Radicals; but the Right, under Hohenwart, had increased to 57, and there were 57 Poles and 54 Czechs.

A combination of these three parties might govern against the constitutionalists. Taaffe, who now became first minister, tried first of all to govern by the help of the moderates of all parties, and he included representatives of nearly every party in his cabinet. But the Liberals again voted against the government on an important military bill, an offence almost as unpardonable in Austria as in Germany, and a great meeting of the party decided that they would not support the government. Taaffe, therefore, was obliged to turn for support to the Right. The German members of the government resigned, their place was taken by Clericals, Poles and Czechs, Smolka was elected president of the Lower House of the Reichsrath, and the German Liberals found themselves in a minority opposed by the "iron ring" of these three parties, and helpless in the parliament of their own creation. For fourteen years Taaffe succeeded in maintaining the position he had thus secured. He was not himself a party man; he had sat in a Liberal government; he had never assented to the principles of the Federalists, nor was he an adherent of the Clerical party. He continued to rule according to the constitution; his watchword was "unpolitical politics," and he brought in little contentious legislation. The great source of his strength was that he stood between the Right and a Liberal government. There was a large majority of constitutionalists; they might easily become a majority, and the Right were therefore obliged to support Taaffe in order to avert this. They continued to support him, even if they did not get from him all that they could have wished, and the Czechs acquiesced in a foreign policy with which they had little sympathy. Something, however, had to be done for them, and from time to time concessions had to be made to the Clericals and the Federalists.

The real desire of the Clericals was an alteration of the school law, by which the control of the schools should be restored to the Church and the period of compulsory education reduced. In this, however, the government did not meet them, and in 1882 the Liberals, under Prince Alfred v. Liechtenstein, separated from Hohenwart's party and founded their own club, so that they could act more freely. Both the new Clerical Club and the remainder of the Conservatives were much affected by the reaction against the doctrines of economic Liberalism. They began to adopt the principles of Christian Socialism expounded by Rudolf Mayer and Baron von Vogelfang, and the economic revolt against the influence of capital was with them joined to a half-religious attack upon the Jews. They represented that Austria was being governed by a close ring of political financiers, many of whom were Jews or in the pay of the Jews, who used the forms of the constitution, under which there was no representation of the working classes, to exploit the labour of the poor at the same time that they ruined the people by alienating them from Christianity in "godless schools." It was during these years that the foundation for the democratic clericalism of the future was laid. The chief political leader in this new tendency was Prince Aloys v. Liechtenstein, who complained of the political influence exercised by the chambers of commerce, and demanded the organization of working men in guilds. It was by their influence that a law was introduced limiting the rate of interest, and they co-operated with the government in legislation for improving the material condition of the people, which had been neglected during the period of Liberal government, and which was partly similar to the laws introduced at the same time in Germany.

There seems no doubt that the condition of the workmen in the factories of Moravia and the oil-mines of Galicia was peculiarly unfortunate; the hours of work were very long, the conditions were very injurious to health, and there were no precautions against accidents. The report of a parliamentary inquiry, called for by the Christian Socialists, showed the necessity for interference. In 1883 a law was carried, introducing factory inspection, extending to mines and all industrial undertakings. The measure seems to have been successful, and there is a general agreement that the inspectors have done their work with skill and courage. In 1884 and 1885 important laws were passed regulating the work in mines and factories, and introducing a maximum working day of eleven hours in factories, and ten hours in mines. Sunday labour was forbidden, and the hours during which women and children could be employed were limited. Great power was given to the administrative authorities to relax the application of these laws in special cases and special trades. This power was at first freely used, but it was closely restricted by a further law of 1893. In 1887-1888 laws, modelled on the new German laws, introduced compulsory insurance against accidents and sickness. These measures, though severely criticized by the Opposition, were introduced to remedy obvious, and in some cases terrible social evils. Other laws to restore gilds among working men had a more direct political object. Another form of Socialism, that of Communism, now took hold. The acquisition of railways by the state. Originally railways had been built by private enterprise, supported in some cases by a state guarantee; a law of 1877 permitted the acquisition of private lines; when Taaffe retired the state possessed nearly 5000 km of railway, not including those which belonged to Austria and Hungary conjointly. In 1899 a minister of railways was appointed. In this policy military considerations as well as economic were of influence. In every department we find the same reaction against the doctrines of laissez-faire. In 1889 for the first time the Austrian budget showed a surplus, partly the result of the new import duties, partly due to a reform of taxation.

For a fuller description of these social reforms, see the Jahrbuch für Staatswissenschaft (Leipzig, 1889, 1888 and 1894); also the annual summary of new laws in the Zeitschrift für Staatswissenschaft (Stuttgart). For the Christian Socialists, see Nitti, Catholic Socialism (London, 1895).

Meanwhile it was necessary for the government to do something for the Czechs and the other Slavs, on whose support they depended for their majority. The influence of the government became more favourable to them in the matter of language, and this caused the struggle of nationalities to assume the first place in Austrian public life—a place which it has ever since maintained. The question of language becomes a political one, so far as it concerns the use of different languages in the public offices and law courts, and in the schools. There never was any general law laying down clear and universal rules, but since the time of Joseph II. German had been the ordinary language of the government. All laws were published in German; German was the sole language used in the central public offices in Vienna, and the language of the court and of the army; moreover, in almost every part of the monarchy it had become the language of what is called the internal service in the public offices and law courts; all books and correspondence were kept in German, not only in the German districts, but also in countries such as Bohemia and Galicia. The bureaucracy and the law courts had therefore become a network of German-speaking officialism extending over the whole country; no one had any share in the government.
unless he could speak and write German. The only exception was in the Italian districts; not only in Italy itself (in Lombardy, and afterwards in Venetia), but in South Tirol, Trieste, Istria and Dalmatia, Italian has always been used even for the internal service of the government offices, and though the actual words of command are now given in German and the officers are obliged to know Serbo-Croatian it remains to this day the language of the Austrian navy. Any interference with the use of German would be a serious blow to the cause of those who hoped to Germanize the whole empire. Since 1867 the old rules have been maintained absolutely as regards the army, and German has also, as required by the military authorities, become the language of the railway administration. It remains the language of the central offices in Vienna, and is the usual, though not the only, language used in the Reichsrath. In 1869 a great innovation was made, when Polish was introduced throughout the whole of Galicia as the normal language of government; and since that time the use of German has almost entirely disappeared in that territory. Similar innovations have also begun, as we shall see, in other parts.

Different from this is what is called the external service. Even in the Austro-Hungarian monarchy the language of the district in communication between the government offices and private individuals, and evidence could be given in the law courts in the language generally spoken. This was not the result of any law, but depended on administrative regulations of the government service; it was practically necessary in remote districts, such as Galicia and Bukovina, where few of the population understood German. In some places a Slav-speaking individual would himself have to provide the interpreter, and approach the government in German. Local authorities, e.g. town councils and the diets, were free to use what language they wished, and in this matter the Austrian government has shown great liberality. The constitution of 1867 laid down a principle of much importance, by which previous custom became established as a right. Article 19 runs: "All races of the empire have equal rights, and every race has an inviolable right to the preservation and use of its own nationality and language. The equality of all customary (landessprich) languages in school, office and public life, is recognized by the state. In those territories in which several races dwell, the public and educational institutions are to be so arranged that, without applying compulsion to learn a second Landessprache, each of the races receives the necessary means of education in its own language."

The application of this law gives great power to the government, for everything depends on what is meant by landessprich, and it rests with them to determine when a language is customary. The Germans demand the recognition of German as a customary language in every, part of the empire, so that a German may claim to have his business attended to in his own language, even in Dalmatia and Galicia. In Bohemia the Czechs claim that their language shall be recognized as customary, even in those districts such as Reichenberg, which are almost completely German; the Germans, on the other hand, claim that the Czech language shall only be recognized in those towns and districts where their considerable Czech population. What the government allowed in the case of Tialfa. Administration did was to interpret this law in a sense more favourable to the Slavs than had hitherto been the case.

Peculiar importance is attached to the question of education. The law of 1867 required that the education in the elementary schools in the Slav districts should be given in Czech or Slovenian, as the case might be. The Slavs, however, required that, even when a small minority of Slav race settled in any town, they should not be compelled to go to the German schools, but should have their own school provided for them; and this demand was granted by Frazak, minister of education under Count Taaffe. The Germans had always hoped that the people as they became educated would cease to use their own particular language. Owing to economic causes the Slavs, who increase more rapidly than the Germans, tend to move westwards, and large numbers settle in the towns and manufacturing districts. It might have been expected that they would then cease to use their own language and become Germanized; but, on the contrary, the movement of population is spreading their language and they claim that special schools should be provided for them, and that men of their own nationality should be appointed to government offices to deal with their business. This has happened not only in many places in Bohemia, but in Styria, and even in Vienna, where there has been a great influx of the Czech population and a Czech school has been founded. The introduction of Slavonic into the middle and higher schools has affected the Germans in their most sensitive point. They have always insisted that German is the Kultur-sprache. On one occasion Count A. Auersperg (Anastasius Grün) entered the diet of Carniola carrying the whole of the Slovenian literature under his arm, as evidence that the Slovenian language could not well be substituted for German as a medium of higher education.

The first important regulations which were issued under the law of 1867 applied to Dalmatia, and for that country between 1872 and 1876 a series of laws and edicts were issued determining to what extent the Slavonic idioms were to be recognized. Hitherto all business had been done in Italian, the language of a small minority living in the seaport towns. The effect of these regulations has been to bring the Slavonian to equality with Italian. It has been introduced in all schools, and nearly all education is given in Croatian, even though a knowledge of Italian is quite essential for the maritime population; and it is only in one or two towns, such as Zara, the ancient capital of the country, that Italian is able to maintain itself. Since 1882 there has been a Slav majority in the diet, and Italian has been disused in the proceedings of that body. In this case the concessions to the Servo-Croatians had been made by the Liberal ministry; they required the parliamentary support of the Dalmatian representatives, who were more numerous than the Italian, and it was also necessary to cultivate the loyalty of the Slav races in this part so as to gain a support for Austria against the Russian party, which was very active in the Balkan Peninsula. It was better to sacrifice the Italians of Dalmatia than the Germans of Carinthia.1

It was not till 1879 that the Slovenes received the support of the government offices to deal with their business. In Carniola they succeeded, in 1882, in winning a majority in the diet, and from this time, while the diet of Styria is the centre of the German, that of Carniola is the chief support of the Slovene agitation. In the same year they won the majority in the town council of Laibach, which had hitherto been German. They were able, therefore, to introduce Illyrian as the official language, and cause the names of the streets to be written up in Illyrian. This question of street names is, as it were, a sign of victory. Serious riots broke out in some of the towns of Istria when, for the first time, Illyrian was used for this purpose as well as Italian. In Prague the victory of the Czechs has been marked by the removal of all German street names, and the Czech town council even passed a by-law forbidding private individuals to use tablets put up with the name of the street in German. In consequence of a motion by the Slovene members of the Reichsrath and a resolution of the diet of Carniola, the government also declared Slovenian to be a recognized language for the whole of Carniola, for the district of Cilli in Styria, and for the Slovene and mixed districts in the south of Carinthia, and determined that in Laibach a Slovene gymnasium should be maintained as well as the German one.

The Germans complain that in many cases the government acted very unfairly to them. They constantly refer to the case of Klagenfurt. This town in Carinthia had a population of 16,491 German-speaking Austrians; the Slovenian-speaking population numbered 5,301, or 30 per cent of the whole town, and 180, or 11 per cent, of the inhabitants of the town were German-speaking. The government, however, in 1880 declared Slovenian a customary language, so that provision had to be made in public offices and law courts for dealing with business in Slovenian. It must be remembered, however, that even though the town was German, the rural population of the surrounding villages was chiefly Slovenian.

It was in Bohemia and Moravia that the contest was fought out with the greatest vehemence. The two races were nearly equal, and the victory of Czech would mean that nearly two

For Dalmatia, see T. G. Jackson, Dalmatia, &c. (Oxford, 1889).
millions of Germans had been placed in a position of subordination; but for the last twenty years there had been a constant encroach- ment by Czech on German. This was partly due to the fact that the ascendancy of 1880 determined that henceforward all business which had been brought before any government office or law court should be dealt with, within the limit, in the language in which it was introduced; this applied to the whole of Bohemia and Moravia, and meant that Czech would henceforward have a position within the government service. It was another step in the same direction when, in 1886, it was ordered that “to avoid frequent translations” business introduced in Czech should be dealt with in the same language in the high courts of Prague and Brünn. Then not only were a large number of Czech elementary schools founded, but also many middle schools were given to the Czechs, and Czech classes introduced in German schools; and, what affected the Germans most, in 1882 classes in Czech were started in the university of Prague—a desecration, as it seemed, of the oldest German university.

The growth of the Slav races was, however, not merely the result of government assistance; it had begun long before Taaffe assumed office; it was to be seen in the census returns and in the results of elections. Prague was no longer the home of the Germans; they had been there fifty years before; the census of 1880 showed 16,000 Germans in the 120,000 Czechs. It was the same in Pilsen. In 1861 the Germans had a majority in this town; in 1880 they were not a quarter of the population. This same phenomenon, which occurs elsewhere, cannot be attributed to any laxity of the Germans. The generation which was so vigorously demanding national rights had themselves all been brought up under the old system in German schools, but this had not implanted in them a desire to become German. It was partly due to economic causes—the greater increase among the Czechs, and the greater migration from the country to the towns; partly the result of the romantic and nationalist movement which had arisen about 1830, and partly the result of establishing popular education and parliamentary government at the same time. As soon as these races which had so long been ruled by the Germans received political liberty and the means of education, they naturally used both to reassert their national individuality.

It may be suggested that the resistance to the German language is to some extent a result of the increased national feeling among the Slavs and the feeling of the Germans. They are both strong.

In the old days it was common for the children of German parents in Bohemia to learn Czech; since 1867 this has ceased to be the case. It may almost be said that they make it a point of honour not to learn it. This is partly due to the fact that the Czech is bi- lingually, it is easier for them to obtain appointments in districts where a knowledge of Czech is required, and the Germans, therefore, regard every order requiring the use of Czech as an order which excludes Germans from a certain number of posts. This attitude of hostility and contempt is strongest among the educated middle class; it is not shown to the same extent by the clergy and the nobles.

The influence of the Church is also favourable to the Slav races, not so much from principle as owing to the fact that they supply more candidates for ordination than the Germans. There is no doubt, however, that the tendency among Germans has been to exalt the principle of nationality above religion, and to give it an ascendency that increased with each defeat. In 1880 they founded a great society, the Deutscher Schulverein, to establish and assist German schools. It spread over the whole of the empire; in a few years it numbered 100,000 members, and had an income of nearly 300,000 gulden; no private society in Austria had ever attained so great a success. In the Reichsrath a motion was introduced, supported by all the German Liberal parties, demanding that German should be declared the language of state and regulating the conditions under which the other idioms could be recognized; it was referred to a committee from which it never emerged, and a bill to the same effect, introduced in 1886, met a similar fate. In Bohemia they demanded, as a means of protecting themselves against the effect of the language ordinances, that the country should be divided into two parts; in one German was to be the sole language, in the other Czech was to be recognized. A proposal to this effect was introduced by them in the diet at the end of 1886, but since 1882 the Germans had been in a minority. The Czechs, of course, refused even to consider it; it would have cut away the ground on which their whole policy was built up, namely, the indissoluble unity of the Bohemian kingdom, in which German and Czech should through- out be recognized as equal and parallel languages. It was rejected on a motion of Prince Karl Schwarzenberg without discussion, and on this all the Germans rose and left the diet, thereby imitating the action of the Czechs in old days when they had the majority.

These events produced a great change on the character of the German opposition. It became more and more avowedly racial; the defence of German nationality was put in the forefront of their programme. The growing national animosity added bitterness to political life, and destroyed the possibility of a strong homogeneous party on which a government might depend. The beginning of this movement can be traced back to the year 1870. About that time a party of young Germans had arisen who professed to care little for constitutionalism and other "legal mummies," but made the preservation and extension of their own nationality their sole object. As is so often the case in Austria, the movement began in the university of Vienna, where a Leseverein (reading club) of German students was formed as a point of cohesion for Germans, which had eventually to be suppressed. The first representative of the movement in parliament was Herr von Schönher, who did not scruple to declare that the Germans looked forward to union with the German empire. They were strongly influenced by men outside Austria. Bismarck was their national hero, the anniversary of Sedan their political festival, and approximation to Germany was dearer to them than the maintenance of Austria. After 1875 a heightening of racial feeling began among the Radicals, and in 1881 all the German parties in opposition joined together in a club called the United Left, and in their programme put in a prominent place the defence of the position of the Germans as the condition for the existence of the state, and demanded that German should be expressly recognized as the official language. The younger and more ardent spirits, however, found it difficult to work in harmony with the older constitutional leaders. They complained that the party leaders were not sufficiently decisive in the measures for self-defence. In 1883 great festivities in honour of Bismarck's eightieth birthday, which had been arranged in Graz, were forbidden by the government, and the Germans of Styria were very indignant that the party did not protest against this with sufficient energy. After the elections of 1885 the Left, therefore, again into two clubs, the "German Austrian," which included the more moderate, and the "German," which wished to use sharper language. The German Club, e.g., congratulated Bismarck on his measures against the Poles; the German Austrians refused to take cognizance of events outside Austria with which they had nothing to do. Even the German Club was not sufficiently decided for Herr von Schönher and his friends, who broke off from it and founded a "National German Union." They spoke much of Germanen und Unverfalschtes Deutsch- tum, and they advocated a political union with the German empire, and were strongly anti-Hungarian and wished to resign all control over Galicia, if by a closer union with Germany they could secure German supremacy in Bohemia and the south Slav countries. They play the same part in Austria as does the "pan-Germanic Union" in Germany. When in 1888 the
two clubs, the German Austrians and the Germans, joined once more under the name of "United German Left" into a new club with eighty-seven members, so as the better to guard against the common danger and to defeat the educational demands of the Clericals, the National Germans remained apart with seventeen members. They were also infected by the growing spirit of anti-Semitism. The German parties had originally been the party of the capitalists, and comprised a large number of Jews; this new German party committed itself to violent attacks upon the Jews, and for this reason alone any real harmony between the different branches would have been impossible.

Notwithstanding the concessions about language the Czechs had, however, made no advance towards their real object—the recognition of the Bohemian kingdom. Perhaps the leaders of the party, who were now growing old, would have been content with the influence they had already attained, but they were hard pressed at home by the Young Czechs, who were more impatient.

When Count Thun was appointed governor of Bohemia, their hopes ran high, for he was supposed to favour the coronation of the emperor at Prague. In 1890, however, instead of proceeding to the coronation as was expected, Taaffe attempted to bring about a reconciliation between the opposing parties. The influence by which his policy was directed was not quite clear, but the Czechs had been of recent years less easy to deal with, and Taaffe had never really shown any wish to alter the constitution; his policy always was to destroy the influence of parliament by playing off one party against the other, and so to win a clear field for the government. During the month of January conferences were held at Vienna, with Taaffe in the chair, to which were invited representatives of the three groups into which the Bohemian representatives were divided, the German party, the Czechs, and the Feudal party. After a fortnight's discussion an agreement was made on the basis of a separation between the German and the Czech districts, and a revision of the electoral law. A protocol enumerating the points agreed on was signed by all who had taken part in the conference, and in May bills were laid before the diet incorporating the chief points in the agreement. But they were not carried; the chief reason being that the Young Czechs had not been asked to take part in the conference, and did not consider themselves bound by its decisions; they opposed the measures and had recourse to obstruction, and a certain number of the Old Czechs gradually came over to them. Their chief ground of criticising the proposed measures was that they would threaten the unity of the Bohemian kingdom. At the elections in 1891 a great struggle took place between the Old and the Young Czechs. The latter were completely victorious; Rieger, who had led the party for thirty years, disappeared from the Reichsrath. The first result was that the proposed agreement with Bohemia came to an end. But the disappearance of the Old Czechs made the parliamentary situation very insecure. The Young Czechs could not take their position; their Radical and anti-clerical tendencies alarmed the Feudalists and Clericals who formed so large a part of the Right; they attacked the alliance with Germany; they made public demonstration of their French sympathies; they entered into communication with other Slav races, especially the Serbs of Hungary and Bosnia; they demanded universal suffrage, and occasionally supported the German Radicals in their opposition to the Clerical parties, especially in educational matters; under their influence disorder increased in Bohemia, a secret society called the Umladina (an imitation of the Servian society of that name) was discovered, and stringent measures had to be taken to preserve order. The government therefore veered round towards the German Liberals; some of the ministers most obnoxious to the Germans resigned, and their places were taken by Germans.

For two years the government seemed to waver; looking now to the Left, now to Hohenwart and his friends; for a time Taaffe really had the support of all parties except the Young Czechs.

After two years he gave up his cautious policy and took a bold move. In October 1893 he introduced a reform bill. Universal suffrage had long been demanded by the working men and the Socialists; the Young Czechs also had put it on their programme, and many of the Christian Socialists and anti-Semites desired an alteration of the franchise. Taaffe's bill, while keeping the curiae of the feudal proprietors and the chambers of commerce as they were, and making no change in the number of members, proposed to give the franchise in both towns and rural districts to every one who could read and write, and had resided six months in one place. This was opposed by the Liberals, for with the growth of socialism and anti-Semitism, they knew that the extension of the franchise would destroy their influence. On this Taaffe had probably calculated, but he had omitted to inquire what the other parties would do. He had not even consulted Hohenwart, to whose assistance he owed his long tenure of power. Not even the pleasure of ruining the Liberals was sufficient to persuade the Conservatives to vote for a measure which would transfer the power from the well-to-do to the indigent, and Hohenwart justly complained that they ought to have been secure against surprises of this kind. The Poles also were against a measure which would give more influence to the Ruthenes. The position of the government was hopeless, and without waiting for a division Taaffe resigned.

The event to which for fourteen years the Left had looked forward had now happened. Once more they could have a share in the government, which they always believed belonged to them by nature. Taaffe, who by experience and adversity, did not scruple to enter into an alliance with their old enemies, and a coalition ministry was formed from the Left, the Clericals and the Poles. The president was Prince Alfred Windisch-Grätz, grandson of the celebrated general, one of Hohenwart's ablest lieutenants; Hohenwart himself did not take office. Of course an administration of this kind could not take a definite line on any controversial question, but during 1894 they carried through the commercial treaty with Russia and the laws for the continuance of the currency reform. The differences of the clubs appeared, however, in the discussions on franchise reform; the government, not strong enough to have a policy of its own, had referred the matter to a committee; for the question having once been raised, it was impossible not to go on with it. This would probably have been fatal to the coalition, but the final blow was given by a matter of very small importance arising from the disputes on nationality. The Slovenes had asked that in the gymnasium at Cilli classes in which instruction was given in Slovenian should be formed parallel to the German classes. This request caused great excitement in Styria and the neighbouring districts; the Styrian diet (from which the Slovene minority had seceded) protested. The Slovenes were, however, members of the Hohenwart Club, so Hohenwart and his followers supported the request, which was adopted by the ministry. The German Left opposed it; they were compelled to do so by the popular indignation in the German districts; and when the vote was carried against them (13th June 1895) they made it a question of confidence, and formally withdrew their support from the government, which therefore at once resigned.

After a short interval the emperor appointed as minister-president Count Badeni, who had earned a great reputation as governor of Galicia. He formed an administration the merit of which, as of so many others, was that it was to belong to no party and to have no programme. He hoped to be able to work in harmony with the moderate elements of the Left; his mission was to carry through the composition (Auszugleich) with Hungary; to this everything else must be subordinated. During 1896 he succeeded in carrying a franchise reform bill, which satisfied nearly all parties. All the old categories of members were maintained, but a fifth curia was added, in which almost any one might vote who had resided six months in one place and was not in domestic service; in this way seventy-two would be added to the existing members. This matter having been
settled, parliament was dissolved. The result of the elections of 1867 was the return of a House so constituted as to make any strong government impossible. On both sides the anti-Semitic parties representing the extreme demagogic elements were present in considerable numbers. The United German Left had almost disappeared; it was represented only by a few members chosen by the great proprietors; in its place there were the three parties—the German Popular party, the German Nationalists, and the German Radicals—who all put questions of nationality first and had deserted the old standpoint of the constitution. Then there were the fourteen Social Democrats who had won their seats under the new franchise. The old party of the Right was, however, also broken up; side by side with forty-one Clericals there were twenty-eight Christian Socialists led by Dr. Lueger, a man of great oratorical power, who had won a predominant influence in Vienna, so long the centre of Liberalism, and had quite eclipsed the more modest efforts of Prince Liechtenstein. As among the German National party, there were strong nationalistic elements in his programme, but they were chiefly directed against Jews and Hellenarians; Lueger had already distinguished himself by his violent attacks on Hungary, which had caused some embarrassment to the government at a time when the negotiations for the Ausgleich were in progress. Like anti-Semites elsewhere, the Christian Socialists were reckless and irresponsible, appealing directly to the passions and prejudices of the most ignorant. There were altogether 200 German members of the Reichsrath, but they were divided into eight parties, and nowhere did there seem to be the elements on which a government could be built up.

The parliamentary situation is best explained by the following table showing the parties:

The most remarkable result of the elections was the disappearance of the Liberals in Vienna. In 1879, out of 37 members returned in Lower Austria, 33 were Liberals, but now they were replaced to a large extent by the Socialists. It was impossible to maintain a strong party of moderate constitutionalists, on whom the government could depend, unless there was a large nucleus from Lower Austria. The influence of Lueger was very embarrassing; he had now a majority of two-thirds in the town council, and had been elected burgomaster. The emperor had refused to confirm the election; he had been re-elected, and then the emperor, in a personal interview, appealed to him to withdraw. He consented to do so; but, after the election of 1897 had given him so many followers in the Reichsrath, Badeni advised that his election as burgomaster should be confirmed.

There was violent antipathy between the Christian Socialists and the German Nationalists, and the transference of their quarrels from the Viennese Council Chamber to the Reichsrath was very detrimental to the orderly conduct of debate.

The limited suffrage had hitherto prevented socialism from becoming a political force in Austria as it had in Germany, and the national divisions have always impeded the creation of a centralized socialist party. The first object of the working classes necessarily was the attainment of the Reichsrath. In 1897 there had been demonstrations and petitions to the government for universal suffrage. During the next years there was the beginning of a real socialist movement in Vienna and in Styria, where there is a considerable industrial population; after 1879, however, the growth of the party was interrupted by the introduction of anarchical doctrines. Most's paper, the Freiheit, was introduced through Switzerland, and had a large circulation. The anarchists, under the leadership of Peukert, seem to have attained considerable numbers. In 1883–1884 there were a number of serious strikes, collisions between the police and the workmen, followed by assassinations; it was a peculiarity of Austrian anarchists that in some cases they united robbery to murder. The government, which was seriously alarmed, introduced severe repressive measures; the leading anarchists were expelled or fled the country. In 1887, under the leadership of Dr. Adler, the socialist party began to revive (the party of violence having died away), and since then it has steadily gained in numbers; in the forefront of the political programme is put the demand for universal suffrage. In no country is the 1st of May, as the festival of Labour, celebrated so generally.

Badeni after the election sent in his resignation, but the emperor refused to accept it, and he had, therefore, to do the best he could and turn for support to the other nationalities. The strongest of them were the fifty-nine Poles and sixty Young Czechs; he therefore attempted, as Taaffe had done, to come to some agreement with them. The Poles were always ready to support the government; among the Young Czechs the more moderate had already attempted to restrain the wilder spirits of the party, and they were quite prepared to enter into negotiations. They did not wish to lose the opportunity which now was open to them of winning influence over the administration.

What they required was further concession as to the language in Bohemia. In May 1897 Badeni, therefore, published his celebrated ordinances. These ordinances (1) that all correspondence and documents regarding every matter brought before the government officials should be conducted in the language in which it was first introduced. This applied to the whole of Bohemia, and meant the introduction of Czech into the government offices throughout the whole of the kingdom; (2) after 1903 no one was to be appointed to a post under the government in Bohemia until he had passed an examination in Czech. These ordinances fulfilled the worst fears of the Germans. The German Nationalists and Radicals declared that no business should be done till they were repealed and Badeni dismissed. They resorted to obstruction. They brought in repeated motions to impeach the ministers, and parliament had to be prorogued in June, although no business of any kind had been transacted. Badeni had not anticipated the effect his ordinances would have; as a Pole he had little experience in the western part of the empire. During the recess he tried to open negotiations, but
the Germans refused even to enter into a discussion until the ordinances had been withdrawn. The agitation spread throughout the country; great meetings were held at Vienna and Aussee, which were attended by Germans from across the frontier, and led to serious disturbances; the cornflower, which had become the symbol of German nationality and union with Germany, was freely worn, and the language used was in many cases treasonable. The emperor insisted that the Reichsrath should again be summoned to pass the necessary measures for the agreement with Hungary; scenes then took place which have no parallel in parliamentary history. To meet the obstruction it was determined to sit at night, but this was unsuccessful. On one occasion Dr. Lecher, one of the representatives of Moravia, spoke for twelve hours, from 9 P.M. till 9 A.M., against the Ausgleich. The opposition was not always limited to feats of endurance of this kind. On the 3rd of November there was a free fight in the House; it arose from a quarrel between Dr. Lueger and the Christian Socialists on the one side (for the Christian Socialists had supported the government since the confirmation of Lueger as burgomaster) and the German Nationalists under Herr Wolf, a German from Bohemia, the violence of whose language it was already caused Badeni to challenge him to a duel. The Nationalists refused to allow Lueger to speak, clapping their desks, hissing and making other noises, till at last the Young Czechs attempted to prevent the disorder by violence. On the 24th of November the scenes of disturbance were renewed. The president, Herr v. Abrahamovitch, an Armenian from Galicia, refused to call on Schönnerer to speak. The Nationalists therefore stormed the platform, and the president and ministers had to fly into their private rooms to escape personal violence, until the Czechs came to their rescue, and by superiority in numbers and physical strength severely punished Herr Wolf and his friends. The rules of the House giving the president no authority for maintaining order, he determined, with the assent of the ministers, to propose alterations in procedure. The next day, when the sitting began, one of the ministers, Count Falkenbayn, a Clerical who was very unpopular, moved "That any member who continued to disturb a sitting after being twice called to order could be suspended—for three days by the president, and for thirty days by the House." The din and uproar was such that not a word could be heard, but at a pre-arranged signal from the president all the Right rose, and he then declared that the new order had been carried, although the procedure of the House required that it should be submitted to a committee. The next day, at the beginning of the sitting, the Socialists rushed on the platform, tore up and destroyed all the papers lying there, seized the president, and held him against the wall. After he had escaped, eighty police were introduced into the House and carried out the fourteen Socialists. The next day Herr Wolf was treated in the same manner. The excitement spread to the street. Serious disorders took place in Vienna and in Graz; the German opposition had the support of the people, and Lueger warned the ministers that as burgomaster he would be unable to maintain order in Vienna; even the Clerical Germans showed signs of deserting the government. The emperor, however, summoned to the House. Badeni’s resignation, the Germans having thus by obstruction attained part of their wishes. The new minister, Gauthz, a man popular with all parties, held office for three months; he proclaimed the budget and the Ausgleich, and in February replaced the language ordinances by others, under which Bohemia was to be divided into three districts—one Czech, one German and one mixed. The Germans, however, were not satisfied with this; they demanded absolute repeal. The Czechs also were offended; they arranged riots at Prague; the professors in the university refused to lecture unless the German students were defended from violence; Gauthz resigned, and Thun, who had been governor of Bohemia, was appointed minister. Martial law was proclaimed in Bohemia, and strictly enforced. Thun then arranged with the Hungarian ministers a compromise about the Ausgleich. The Reichsrath was again summoned, and the meetings were less disturbed than in the former year, but the Germans still prevented any business from being done. The Germans now had a new cause of complaint. Paragraph 14 of the Constitutional law of 1897 provided that, in cases of pressing necessity, orders for which the assent of the Reichsrath was required might, if the Reichsrath were not in session, be proclaimed by the emperor; they had to be signed by the whole ministry, and if they were not laid before the Reichsrath within four months of its meeting, or if they did not receive the approval of both Houses, they ceased to be valid. The Germans contended that the application of this clause to the Ausgleich was invalid, and demanded that it should be repealed. Thun had in consequence to retire, in September 1898. His successor, Count Clary, began by withdrawing the ordinances which had been the cause of so much trouble, but it was now too late to restore peace. The Germans were not sufficiently strong and united to keep in power a minister who had brought them the relief for which they had been clamouring for two years. The Czechs, of course, went into opposition, and used obstruction. The extreme German party, however, took the occasion to demand that paragraph 14 should be repealed. Clary explained that this was impossible, but he gave a formal pledge that he would not use it. The Czechs, however, prevented him passing a law on excise which was a necessary part of the agreements with Hungary; it was, therefore, impossible for him to carry on the government without breaking his word; there was nothing left for him to do but to resign, after holding office for less than three months. The emperor then appointed a ministry of officials, who were not bound by his pledge, and used paragraph 14 for the necessary purposes of state. They then made way for a ministry under Herr v. Körber. During the early months of 1900 matters were more peaceful, and Körber hoped to be able to arrange a compromise; but the Czechs now demanded the restoration of their language in the internal service of Bohemia, and on 8th June, by noise and disturbance, obliged the president to suspend the sitting. The Reichsrath was immediately dissolved, the emperor having determined to make a final attempt to get together a parliament with which it would be possible to govern. The new elections on which so much was to depend did not take place till January 1901. They resulted in a great increase of the extreme German Nationalist parties. Schönnerer and the German Radicals—the fanatical German party who in their new programme advocated union of German Austria with the German empire—now numbered twenty-one, who chiefly came from Bohemia. They were able for the first time to procure the election of one of their party in the Austrian Delegation, and threatened to introduce into the Assembly scenes of disorder similar to those which they had made common in the Reichsrath. All those parties which did not primarily appeal to national feeling suffered loss; especially was this the case with the two sections of the Clericals, the Christian Socialists and the Ultra-montanes; and the increasing enmity between the German Nationalists (who refused even the name German to a Roman Catholic) and the Church became one of the conspicuous features in the political situation. The loss of seats by the Socialists showed that even among the working men the national agitation was gaining ground; the diminished influence of the anti-Semites was the most encouraging sign.

Notwithstanding the result of the elections, the first months of the new parliament passed in comparative peace. There was a truce between the nationalities. The Germans were more occupied with their opposition to the Clericals than with their feud with the Slavs. The Czechs refrained from obstruction, for they did not wish to forfeit the alliance with the Poles and Conservatives, on which their parliamentary strength depended, and the Germans used the opportunity to pass measures for promoting the material prosperity of the country, especially for an important system of canals which would bring additional prosperity to the coal-fields and manufactures of Bohemia.

(J.W. I.)

The history of Austria since the general election of 1901 is the
history of franchise reform as a crowning attempt to restore parliament to normal working conditions. The premier, Dr von Körber, who had undertaken to overcome obstruction and who hoped to effect a compromise between Germans and Czechs, induced the Chamber to sanction the estimates, the contingent of recruits and other “necessities of state” for 1901 and 1902, by promising to undertake large public works in which Czechs and Germans were alike interested. These public works were chiefly a canal from the Danube to the Oder; a ship canal from the Danube to the Moldau near Budweis, and the canalization of the Moldau from Budweis to Prague; a ship canal running from the projected Danube-Oder canal near Prerau to the Elbe near Pardubitz, and the canalization of the Elbe from Pardubitz to Melnik; a navigable connexion between the Danube-Oder Canal and the Vistula and the Dniester. It was estimated that the construction of these four canals would require twenty years, the funds being furnished by a 4% loan amortizable in ninety years. In addition to the canals, the cabinet proposed and the Chamber sanctioned the construction of a “second railway route to Trieste” designed to shorten the distance between South Germany, Salzburg and the Adriatic, by means of a line passing under the Alpine ranges of central and southern Austria. The principal sections of this line were named after the ranges they pierced, the chief tunnels being bored through the Tauern, Karawanken and Wochein hills. Sections were to be thrown open to traffic as soon as completed and the whole work to be ended during 1909. The line forms one of the most interesting railway routes in Europe. The cost, however, greatly exceeded the estimate sanctioned by parliament; and the contention that the parliamentary adoption of the Budget in 1901–1902 cost the state £100,000,000 for public works, is not entirely unfounded. True, these works were in most cases desirable and in some cases necessary, but they were hastily promised and often hastily begun under pressure of political expediency. The Körber administration was for this reason subsequently exposed to severe censure.

Despite these public works Dr von Körber found himself unable to induce parliament to vote the Budgets for 1903, 1904 or 1905, and was obliged to revert to the expedient employed by his predecessors of sanctioning the estimates by imperial ordinance under paragraph 14 of the constitution. His attempts in December 1902 and January 1903 to promote a compromise between Czechs and Germans proved equally futile. Körber proposed that Bohemia be divided into 10 districts, of which 5 would be Czech, 3 German and 2 mixed. Of the 234 district tribunals, 133 were to be Czech, 94 German and 7 mixed. The Czechs demanded on the contrary that both their language and German should be placed on an equal footing throughout Bohemia, and be used for all official purposes in the same way. As this demand involved the recognition of Czech as a large and well-organized service in Bohemia it was refused by the Germans. Thenceforward, until his fall on the 31st of December 1904, Körber governed practically without parliament. The Chamber was summoned at intervals rather as a pretext for the subsequent employment of paragraph 14 than in the hope of securing its assent to legislative measures. The Czechs blocked business by a pile of “urgency motions” and occasionally indulged in noisy obstruction. On one occasion a sitting lasted 57 hours without interruption. In consequence of Czech aggressiveness, the German parties (the German Progressists, the German Populists, the Constitutional Landed Proprietors and the Christian Socialists) created a joint executive committee and a supreme committee of four members to watch over German racial interests.

By the end of 1904 it had become clear that the system of government by paragraph 14, which Dr von Körber had perfected was not effective in the long run. Loans were needed for military and other purposes, and paragraph 14 itself declares that it cannot be employed for the contraction of any lasting burden upon the exchequer, nor for any sale of state patronymy. As the person of the premier had become so obnoxious to the Czechs that his removal would be regarded by them as a concession, his resignation was suddenly accepted by the emperor, and, on the 22nd of February 1905, a former premier, Baron von Gautsch, was appointed in his stead. Parliamentary activity was at once resumed; the Austro-Hungarian tariff contained in the Szafi-Körber compact was adopted, the estimates were discussed and the commercial treaty with Germany ratified. In the early autumn, however, a radical change came over the spirit of Austrian politics. For nearly three years Austria had been watching with bitterness and depression the course of the crisis in Hungary. Parliament had repeatedly expressed its disapproval of the Magyar demands upon the crown, but had succeeded only in demonstrating its own impotence. The feeling that Austria could be compelled by imperial ordinance under paragraph 14 to acquiesce in whatever concessions the crown might make to Hungary galled Austrian public opinion and prepared it for coming changes. In August 1905 the crown took into consideration and in September sanctioned the proposal that universal suffrage be introduced into the official programme of the Fejérváry cabinet then engaged in combating the Coalition in Hungary. It is not to be supposed that the king of Hungary assented to this programme without reflecting that what he sought to further in Hungary, it would be impossible for him, as emperor of Austria, to oppose in Cisleithania. His subsequent action justifies, indeed, the belief that, when sanctioning the Fejérváry programme, the monarch had already decided that universal suffrage should be introduced in Austria; but even he can scarcely have been prepared for the rapidity with which the movement in Austria gained ground and accomplished its object.

On the 17th of September 1905 a huge socialist and working-class demonstration in favour of universal suffrage took place before the parliament at Budapest. The Austrian Socialist party, encouraged by this manifestation and by the revolutionary movement in Russia, had resolved to press for franchise reform in Austria also. An initial demonstration, resulting in some bloodshed, was organized in Vienna at the beginning of November. At Prague, Graz and other towns, demonstrations and collisions with the police were frequent. The premier, Baron Gautsch, who had previously disavowed universal suffrage while admitting the desirability of a restricted reform, then changed attitude and permitted an enormous Socialist demonstration, in support of universal suffrage, to take place (November 28) in the Vienna Ringstrasse. Traffic was suspended for five hours while an orderly procession of workmen, ten abreast, marched silently along the Ringstrasse past the houses of parliament. The demonstration made a deep impression upon public opinion. On the same day the premier promised to introduce by February a large measure of franchise reform so framed as to protect racial minorities from being overwhelmed at the polls by majorities of other races. On the 22nd of February 1906 he indeed brought in a series of franchise reform measures. Their main principles were the abolition of the curia or electoral class system and the establishment of the franchise on the basis of universal suffrage; and the division of Austria electorally into racial compartments within which each race would be assured against molestation from other races. The Gautsch redistribution bill proposed to increase the number of constituencies from 425 to 455, to allot a fixed number of constituencies to each province and, within each province, to each race according to its numbers and tax-paying capacity. The reform bill proper proposed to enfranchise every male citizen above 24 years of age with one year’s residential qualification.

At first the chances of the adoption of such a measure seemed small. It was warmly supported from outside by the Social Democrats, who held only 11 seats in the House; inside, the Christian Socialists on the Liberal party side opposed it, as far as they hoped to gain seats at the expense of the German Progressives and German Populists and to extend their own organization throughout the empire. The Young Czechs, too, were favourable, while the Poles reserved their attitude. Hostile
in principle and by instinct, they waited to ascertain the mind of the emperor, before actively opposing the reform. With the exception of the German Populists who felt that a German "Liberal" party could not well oppose an extension of popular rights, all the German Liberals were antagonistic, some bitterly, to the measure. The Constitutional Landed Proprietors who had played so large a part in Austrian politics since the 'sixties, and had for a generation held the leadership of the German element in parliament and in the country, saw themselves doomed and the leadership of the Germans given to the Christian Socialists. None of the representatives of the curia system fought so tenaciously for their privileges as did the German nominees of the curia of large landed proprietors. Their opposition proved unavailing. The emperor frowned repeatedly upon their efforts.

Baron Gautsch fell in April over a difference with the Poles, and his successor, Prince Konrad zu Hohenlohe-Schillingsfürst, who had taken over the reform bills, resigned also, six weeks later, as a protest against the action of the crown in consenting to the enactment of a customs tariff in Hungary distinct from, though identical with, the joint Austro-Hungarian tariff comprised in the Széll-Kőrber compact and enacted as a joint tariff by the Reichsrath. A new cabinet was formed (June 1) by Baron von Beck, permanent under secretary of state in the ministry for agriculture, an official of considerable ability who had first acquired prominence as an instructor of the heir apparent, Archduke Francis Ferdinand, in constitutional and administrative law. By dint of skilful negotiation with the various parties and races, and steadily supported by the emperor who, on one occasion, summoned the recalcitrant party leaders to the Hofburg ad audientium verbum and told them the reform "must be accomplished," Baron Beck succeeded, in October 1906, in attaining a final agreement, and on the 1st of December in securing the adoption of the reform. During the negotiations the number of constituents was raised to 516, divided, according to provinces, as follows:—

In the allotment of the constituencies to the various races their tax-paying capacity was taken into consideration. In mixed districts separate constituencies and registers were established for the electors of each race, who could only vote on their own register for a candidate of their own race. Thus Germans were obliged to vote for Germans and Czechs for Czechs; and, though there might be victories of Clerical over Liberal Germans or of Czech Radicals over Young Czechs, there could be no victories of Czechs over Germans, Poles over Ruthenians, or Slovenses over Italians. The constituencies were divided according to races as follows:—

Germans of all parties 233 previously 205
Czechs of all parties 168 81
Poles 60 71
Southern Slavs (Slovenes, Croats, Serbs) 37 27
Ruthenians 34 11
Italians 19 18
Rumanians 5 5

These allotments were slightly modified at the polls by the victory of some Social Democratic candidates not susceptible of strict racial classification. The chief feature of the allotment was, however, the formal overthrow of the fiction that Austria is preponderantly a German country and not a country preponderantly Slav with a German dynasty and a German façade. The German constitutions, though allotted in a proportion unduly favourable to the Germans, with 233 seats, in a permanent minority as compared with the 159 Slav seats. Even with the addition of the "Latin" (Rumanian and Italian) seats the "German-Latin block" amounted only to 257. This "block" no longer exists in practice, as the Italians now tend to co-operate rather with the Slavs than with the Germans. The greatest gainers by the redistribution were the Ruthenians, whose representation was trebled, though it is still far from being proportioned to their numbers. This and other anomalies will doubtless be corrected in future revisions of the allotment, although the German parties, foreseeing that any revision must work out to their disadvantage, stipulated that a two-thirds majority should be necessary for any alteration of the law.

After unsuccessful attempts by the Upper House to introduce plural voting, the bill became law in January 1907, the peers insisting only upon the establishment of a fixed maximum number or numerus clausus, of non-hereditary peers, so as to prevent the resistance of the Upper Chamber from being overwhelmed at any critical moment by an influx of crown nominees appointed ad hoc. The general election which took place amid considerable enthusiasm on the 14th of May resulted in a sweeping victory for the Social Democrats whose number rose from 11 to 82; in a less complete triumph for the Christian Socialists who increased from 27 to 72; and in the success of the extremer over the conservative elements in all races. A classification of the groups in the new Chamber presents many difficulties, but the following statement is approximately accurate. It must be premised that, in order to render the Christian Socialist or Luenger party the strongest group in parliament, an amalgamation was effected between them and the conservative Catholic party:—

519
The legislature elected by universal suffrage worked fairly smoothly during the first year of its existence. The estimates were voted with regularity, racial animosity was somewhat less prominent, and some large issues were debated. The desire not to disturb the emperor's Diamond Jubilee year by a crowded scene doubtless contributed to calm political progress. It was celebrated in gói Commission success. But it was no sooner over than the crisis over the annexation of Bosnia and Herzegovina, which is dealt with above, eclipsed all purely domestic affairs in the larger European question. (H.W.S.)

AUSTRIAN SUCCESSION

he could fire five shots to the Austrian's three, though the cavalry and artillery were less efficient. But the initial advantage of Frederick's army was that it had, undisturbed by war, developed the standing army theory to full effect. While the Austrians had to wait for drafts to complete the field forces, Prussian regiments could take the field at once, and thus Frederick was able to overrun Silesia almost unopposed. His army was concentrated quietly upon the Oder, and without declaration of war, on the 16th of December 1740, it crossed the frontier into Silesia. The Austrian generals could do no more than garrison a few fortresses, and with the small remnant of their available forces fell back to the mountain frontier of Bohemia and Moravia. The Prussian army was soon able to go into winter quarters, holding all Silesia and investing the strong places of Glogau, Briesg and Neisse.

2. Silesian Campaign of 1741.—In February 1741, the Austrians collected a field army under Count Neipperg (1684—1774) and made preparations to reconquer Silesia. The Austrians in Neisse and Briesg still held out. Glogau, however, was stormed on the night of the 9th of March, the Prussians, under Prince Leopold (the younger) of Anhalt-Dessau, executing their task in one hour with a mathematical precision which excited universal admiration. But the Austrian army in Moravia was now in the field, and Frederick's cantonments were dispersed over all Upper Silesia. It was a work of the greatest difficulty to collect the army, for the ground was deep in snow, and before it was completed Neisse was relieved and the Prussians cut off from their own country by the march of Neipperg from Neisse on Briesg; a few days of slow manœuvre between these places ended in the battle of Mollwitz (10th April 1741), the first pitched battle fought by Frederick and his army. The Prussian right wing of cavalry was speedily routed, but the day was retrieved by the magnificent discipline and tenacity of the infantry. The Austrian cavalry was shattered in repeated attempts to ride them down, and before the Prussian volleys the Austrian infantry, in spite of all that Neipperg and his officers could do, gradually melted away. After a stubborn contest the Prussians remained masters of the field. Frederick himself was far away. He had fought in the cavalry mêlée, but after this, when the battle seemed lost, he had been persuaded by Field Marshal Schwerin to ride away. Schwerin thus, like Marshal Sax at Fontenoy, remained behind to win the victory, and the king narrowly escaped being captured by wandering Austrian hussars. The immediate result of the battle was that the king secured Briesg, and Neipperg fell back to Neisse, where he maintained himself and engaged in a war of manœuvre during the summer. But Europe realized suddenly that a new military power had arisen, and France sent Marshal Belleisle to Frederick's camp to negotiate an alliance. Thenceforward the "Silesian adventure" became the War of the Austrian Succession. The elector of Bavaria's candidature for the imperial dignity was to be supported by a French "auxiliary" army, and other French forces were sent to observe Hanover. Saxony was already watched by a Prussian army under Prince Leopold of Anhalt-Dessau, the "old Dessau," who had trained the Prussian army to its present perfection. The task of Sweden was to prevent Russia from attacking Prussia, but her troops were defeated, on the 3rd of September 1741, at Wilmanstrand by a greatly superior Russian army, and in 1742 another great reverse was sustained in the capitulation of Helsingfors. In central Italy an army of Neapolitans and Spaniards was collected for the conquest of the Milanese.

3. The Allies in Bohemia.—The French duly joined the elector's forces on the Danube and advanced on Vienna; but the objective was suddenly changed, and after many counter-marches the allies advanced, in three widely-separated corps, on Prague. A French corps moved via Amberg and Pilsen. The elector marched on Budweis, and the Saxons (who had now joined the allies) invaded Bohemia by the Elbe valley. The Austrians could at first offer little resistance, but before long a considerable force intervened at Tabor between the Danube and the allies, and Neipperg was now on the march from Neisse to join in the campaign. He had made with Frederick the curious agreement of Klein Schnellendorf (9th October 1741), by which Neisse was surrendered after a mock siege, and the Austrians undertook to leave Frederick unmolested in return for his releasing Neipperg's army for service elsewhere. At the same time the Hungarians, moved to enthusiasm by the personal appeal of Maria Theresa, had put into the field a levée en masse, or "insurrection," which furnished the regular army with an invaluable force of light troops. A fresh army was collected under Field Marshal Khevenhüller at Vienna, and the Austrians planned an offensive winter campaign against the Franco-Bavarian forces in Bohemia and the small Bavarian army that remained on the Danube to defend the electorate. The French in the meantime had stormed Prague on the 26th of November, the grand-duke Francis, consort of Maria Theresa, who commanded the Austrians in Bohemia, moving too slowly to save the fortress. The elector of Bavaria, who now styled himself archduke of Austria, was crowned king of Bohemia (19th December 1741) and elected to the imperial throne as Charles VII. (24th January 1742), but no active measures were undertaken. In Bohemia the month of December was occupied in meetings. On the Danube, Khevenhüller, the best general in the Austrian service, advanced on the 27th of December, swiftly drove back the allies, shut them up in Linz, and pressed on into Bavaria. Munich itself surrendered to the Austrians on the coronation day of Charles VII. At the close of this first act of the campaign the French, under the old Marshal de Broglie, maintained a precarious foothold in central Bohemia, menaced by the main army of the Austrians and Khevenhüller was ranging unopposed in Bavaria, while Frederick, in pursuance of his secret obligations, lay inactive in Silesia. In Italy the allied Neapolitans and Spaniards had advanced towards Modena, the duke of which state had allied himself with them, but the vigilant Austrian commander Count Traun had outmanoeuvred them, captured Modena, and forced the duke to make a separate peace.

4. Campaign of 1742.—Frederick had hoped by the truce to secure Silesia, for which alone he was fighting. But with the successes of Khevenhüller and the enthusiastic "insurrection" of Hungary, Maria Theresa's opposition became firmer, and she divulged the provisions of the truce, in order to compromise Frederick with his allies. The war recommenced. Frederick had not rested on his laurels; in the uneven summer campaign of 1741 he had found time to begin that reorganization of his cavalry which was before long to make it even more efficient than his infantry. Charles VII., whose territories were overrun by the Austrians, asked him to create a diversion by invading Moravia. In December 1741, therefore, Schwerin had crossed the border and captured Olmitz. Glitz also was invested, and the Prussian army was concentrated about Olmitz in January 1742. A combined plan of operations was made by the French, Saxons and Prussians for the rescue of Linz. But Linz soon fell; Broglie on the Moldau, weakened by the departure of the Bavarians to oppose Khevenhüller, and of the Saxons to join forces with Frederick, was in no condition to undertake the offensive, and the Austrians, under Field Marshal Klein of Lorrai, lay in wait between Olmiitz and Budweis. Frederick's march was made towards Iglau in the first place. Brunn was invested about the same time (February), but the direction of the march was changed, and instead of moving against Prince Charles, Frederick pushed on southwards by Naim and Nikolsburg. The extreme outposts of the Prussians appeared before Vienna. But Frederick's advance was a mere foray, and Prince Charles, leaving a screen of troops in front of Broglie, marched to cut off the Prussians from Silesia, while the Hungarian levies poured into Upper Silesia by the Jablunka Pass. The Saxons, discontented and demoralized, soon marched off to their own country, and Frederick with his Prussians fell back by Zwittau and Leutewischl to Kuttenberg in Bohemia, where he was in touch with Broglie on the one hand and (Glitz having now surrendered) with Silesia on the other. No defence of Olmitz was attempted, and the small Prussian corps remaining in Moravia fell back towards Upper Silesia. Prince Charles, in pursuit of the king
marched by Iglau and Teutsch (Deutsch) Brod on Kuttenberg, and on the 15th of May was fought the battle of Chotusitz by Czaslau, in which after a severe struggle under the king was victorious. His cavalry by this occasion retrieved its previous failure, and its conduct gave an earnest of its future glory not only by its charges on the battlefield, but its vigorous pursuit of the defeated Austrians. Almost at the same time Broglie fell upon a part of the Austrians left on the Moldau and won a small, but morally and politically important, success in the action of Sahay, near Budweis (May 24, 1742). Frederick did not propose another combined movement. His victory and that of Broglie disposed Maria Theresa to cede Silesia in order to make good her position elsewhere, and the separate peace between Prussia and Austria, signed at Breslau on the 11th of June, closed the First Silesian War. The War of the Austrian Succession continued.

5. The French at Prague.—The return of Prince Charles, released by the peace of Breslau, put an end to Broglie's offensive. The prince pushed back the French posts everywhere, and his army converged upon Prague, where, towards the end of June 1743, the French were to all intents and purposes in the city. Broglie had, however, centralised his forces with his inferior forces, and still displayed great activity, but his position was one of great peril. The French government realized at last that it had given its general inadequate forces. The French army on the lower Rhine, hitherto in observation of Hanover and other possibly hostile states, was hurried into Franconia. Prince Charles at once raised the siege of Prague (September 14), called up Khevenhüller with the greater part of the Austrian army on the Danube, and marched towards Amberg to meet the new opponent. Marshal Maillébois (1682-1762), its commander, then manoeuvred from Amberg towards the Egger valley, to gain touch with Broglie. Marshal Belleisle, the political head of French affairs in Germany and a very capable general, had accompanied Broglie throughout, and it seems that Belleisle and Broglie believed that Maillébois' mission was to regain a permanent foothold for the army in Bohemia; Maillébois, on the contrary, conceived that his work was simply to disengage the army of Broglie from its dangerous position, and pursue its retreat. His operations were no more than a demonstration, and had so little effect that Broglie was sent for in haste to take over the command from him, Belleisle at the same time taking over charge of the army at Prague. Broglie's command was now on the Danube, east of Regensburg, and the imperial (chiefly Bavarian) army of Charles VII. under Seckendorf aided him to clear-Bavaria of the Austrians. This was effected with ease, for Khevenhüller and most of his troops had gone to Bohemia. Prince Charles and Khevenhüller now took post between Linz and Passau, leaving a strong force to deal with Belleisle in Prague. This, under Prince Lobkowitz, was little superior in numbers or quality to the troops under Belleisle, under whom served Saxe and the best of the younger French generals, but its light cavalry swept the country clear of provisions. The French were quickly on the verge of starvation, winter had come, and the marshal resolved to retreat. On the night of the 16th of December 1742, the army left Prague to be followed by Broglie with its right wing under Chevert, and took the route of Eger. The retreat (December 16-26) was accounted a triumph of generality, but the weather made it painful and costly. The brave Chevert displayed such confidence that the Austrians were glad to allow him freedom to join the main army. The cause of the new emperor was now sustained only in the valley of the Danube, where Broglie and Seckendorf opposed Prince Charles and Khevenhüller, who were soon joined by the force lately opposing Belleisle.

In Italy, Traun held his own with ease against the Spaniards and Neapolitans. Naples was forced by a British squadron to withdraw her troops for home defence, and Spain, now too weak to advance in the Po valley, sent a second army to Italy via France. Sardinia had allied herself with Austria, and at the same time neither state was at war with France, and this led to curious complications, combats being fought in the Isère valley between the troops of Sardinia and of Spain, in which the French took no part.

6. The Campaign of 1743 opened disastrously for the emperor. The French and Bavarian armies were not working well together, and Broglie and Seckendorf had actually quarrelled. No connected resistance was offered to the converging march of Prince Charles's army along the Danube, Khevenhüller from Salzburg towards southern Bavaria, and Prince Lobkowitz (1685-1755) from Bohemia towards the Naab. The Bavarians suffered a severe reverse near Braunau (May 9, 1743), and now an Anglo-allied army commanded by King George II., which had been formed on the lower Rhine on the withdrawal of Maillébois, was advancing southward to the Main and Neckar country. A French army, under Marshal Noailles, was being collected on the middle Rhine to deal with this new force. But Broglie was now in full retreat, and the strong places of Bavaria surrendered one after the other to Prince Charles. The French and Bavarians had been driven almost to the Rhine when Noailles and the king came to battle. George, completely outmanoeuvred by his veteran antagonist, was in a position of the greatest danger before Aschaffenburg and Hanau, in the north formed by the Spessart Hills and the river Main. Noailles blocked the outlet and had posts all around, but the allied troops forced their way through and inflicted heavy losses on the French, and the battle of Dettingen is justly reckoned as a notable victory of the British arms (June 27). Both Broglie, who, worn out by age and exertions, was soon replaced by Marshal Coigny (1670-1759), and Noailles were now on the strict defensive behind the Rhine. Not a single French soldier remained in Germany, and Prince Charles prepared to force the passage of the great river in the Breisgau while the king of England moved forward via Mainz to co-operate by drawing upon himself the attention of both the French marshals. The Anglo-allied army took Worms, but after several unsuccessful attempts to cross, Prince Charles went into winter quarters. The king followed his example, drawing in his troops to the northward, to deal, if necessary, with the army which the French were collecting on the frontier of Flanders. Austria, England, Holland and Denmark were now allied; Saxony changed sides, and Sweden and Russia neutralized each other (peace of Abo, August 1743). Frederick was still qiuescent; France, Spain and Bavaria alone continued actively the struggle against Maria Theresa.

In Italy, the Spaniards on the Panaro had achieved a Pyrrhic victory over Traun at Campo Santo (February 8, 1743), but the next six months were wasted in inaction, and Lobkowitz, joining Traun with reinforcements from Germany, drove back the enemy to Rimini. The Spanish-Piedmontese war in the Alps continued without much result, the only incident of note being a combat at Casteldelfino won by the king of Sardinia in person.

7. Campaign of 1744.—With 1744 began the Second Silesian War. Frederick, disquieted by the universal success of the Austrian cause, secretly concluded a fresh alliance with Louis XV. France had posed hitherto as an auxiliary, her officers in Germany had worn the Bavarian cockade, and only with England was she officially at war. She now declared war direct upon Austria and Sardinia (April 1744). A corps was assembled at Dunkirk to support the cause of the Pretender in Great Britain, and Louis in person, with 90,000 men, prepared to invade the Austrian Netherlands, and took Menin and Ypres. His presumed opponent was the allied army previously under King George and now composed of English, Dutch, Germans and Austrians. On the Rhine, Coigny was to make head against Prince Charles, and a fresh army under the prince de Conti was to assist the Spaniards in Piedmont and Lombardy. This plan was, however, at once dislocated by the advance of Charles, who, assisted by the veteran Traun, skilfully manoeuvred his army over the Rhine near Philippsburg (July 1), captured the lines of Weissenburg, and cut off the French marshal from Alsace. Coigny, however, cut his way through the enemy at Weissenburg and posted himself near Strassburg. Louis XV. now abandoned the invasion of Flanders, and his army moved down to take a decisive part
in the war in Alsace and Lorraine. At the same time Frederick crossed the Austrian frontier (August).

The Austrian resources, the & Austria were fully occupied, and the Prussians were almost unopposed. One column passed through Saxony, another through Lusatia, while a third advanced from Silesia. Prague, the objective, was reached on the 2nd of September. Six days later the Austrian garrison was compelled to surrender, and the Prussians advanced to Budweis. Maria Theresa once again rose to the emergency, a new “insurrection” took the field in Hungary, and a corps of regulars was assembled to cover Vienna, while the diplomatists won over Saxony to the Austrian side. Prince Charles withdrew from Alsace, unmolested by the French, who had been thrown into confusion by the sudden and dangerous illness of Louis XV. at Metz. Only Saxon and Bavarian pursuit was the Austrians, who were isolated and exposed to the combined attack of the Austrians and Saxons. Marshal Traun, summoned from the Rhine, held the king in check in Bohemia, the Hungarian irregulars inflicted numerous minor reverses on the Saxons, and finally Prince Charles arrived with the main army. The campaign resulted in the French retreat being closely watched, and the rearguard pressed hard. Prague fell, and Frederick, completely outmanoeuvred by the united forces of Prince Charles and Traun, regained Silesia with heavy losses. At the same time, the Austrians gained no foothold in Silesia itself. On the Rhine, Louis, now recovered, had besieged and taken Freiburg, after which the forces left in the north were reinforced and besieged the strong places of Flanders. There was also a slight war of manoeuvre on the middle Rhine.

In 1744 the Italian war became for the first time serious. A grandiose plan of campaign was formed, and as usual the French and Spanish generals at the front were hampered by the orders of their respective governments. The object was to unite the army in Dauphiné with that on the lower Po. The adhesion of Genoa was secured, and a road thereby obtained into central Italy. But Lobkowitz had already taken the offensive and driven back the Spanish army of Count de Gages towards and north of the frontier. The king of Naples at this juncture was compelled to assist the Spaniards at all hazards. A combined army was formed at Velletri, and defeated Lobkowitz there on the 11th of August. The crisis past, Lobkowitz then went to Piedmont to assist the king against Conti, the king of Naples returned home, and de Gages followed the Austrians with a weak force. The war in the Alps and the Apennines was keenly contested. Villefranche and Montalban were stormed by Conti on the 20th of April, a desperate fight took place at Peyre-Longue on the 18th of July, and the king of Sardinia was defeated in a great battle at Madonna del Olmo (September 30) near Coni (Cuneo). Conti did not, however, succeed in taking this fortress, and had to retire into Dauphiné for his winter quarters. The two armies had, therefore, failed in their attempt to combine, and the Austro-Sardinians still lay between them.

8. Campaign of 1744.—The interest of the next campaign centres in the three greatest battles of the war—Hohenfriedberg, Kesselsdorf, and Tournay. The first event of the year was the Quadruple Alliance of England, Austria, Holland and Saxony, concluded at Warsaw on the 8th of January. Twelve days previously, the death of Charles VII. summoned the imperial title to a new election, and his successor in Bavaria was not a candidate. The Bavarian army was again fortunate; caught in its scattered winter quarters (action of Amberg, January 7), it was driven from point to point, and the young elector had to abandon Munich once more. The peace of Füssen followed on the 22nd of April, by which he secured his hereditary states on condition of supporting the candidature of the grand-duke Francis, consort of Maria Theresa. The “imperial” army ceased ipso facto to exist, and Frederick was again isolated. No help was to be expected from France, whose efforts this year were centred on the Flanders campaign. In effect, on the 10th of May, before Frederick took the field, Louis XV. and Sax had besieged Tournay, and inflected upon the relieving army of the duke of Cumberland the great defeat of Fontenoy (q.v.). In Silesia the customary small war had been going on for some time, and the concentration of the Prussian army was not effected without severe fighting. At the end of May, Frederick, with about 65,000 men, lay in the camp of Frankenstein, between Glatt and Neisse, while behind the Riesengebirge about Landshut Prince Charles had 85,000 Austrians and Saxons. On the 4th of June was fought the battle of Hohenfriedberg (q.v.) or Striegau, the greatest victory as yet of Frederick’s career, and, of all his battles, excelled perhaps by Leuthen and Rossbach only. Prince Charles suffered a complete defeat and withdrew through the mountains as he had come. Frederick’s pursuit was methodical, for the country was difficult and barren, and he did not know the extent to which the enemy was demoralized. The manoeuvres of both leaders on the upper Elbe occupied all the summer, while the political questions of the imperial election and of an understanding between Prussia and England were pending. The chief efforts of Austria were directed towards the valleys of the Main and Lahn and Frankfort, where the French and Austrian armies manoeuvred for a position from which to envelope the electoral body. Marshal Traun was successful, and the grand-duke became the emperor Francis I. on the 13th of September. Frederick agreed with England to recognize the election a few days later, but Maria Theresa would not conform to the treaty of Breisgau without a further appeal to the fortune of war. Saxony joined in this last attempt. A new advance of Prince Charles quickly brought on the battle of Soor, fought on ground destined to be famous in the war of 1866. Frederick was at first in a position of great peril, but his army changed front in the face of the advancing enemy and by its boldness and tenacity won a remarkable victory (September 30). But the campaign was not ended. An Austrian contingent from the Main joined the Saxons under Marshal Rutowski, and a combined movement was made in the direction of Berlin by Rutowski from Saxony and Prince Charles from Bohemia. The danger was very great. Frederick hurried up his forces from Silesia and marched as rapidly as possible on Dresden, winning the actions of Kollwitz-Hennersdorf (November 24) and Gottleitz (November 25). Prince Charles was thereby checked, and now a second Prussian army under the old Dessauer advanced up the Elbe from Magdeburg to meet Rutowski. The latter took up a strong position at Kesselsdorf between Meissen and Dresden, but the veteran Leopold attacked him directly and without hesitation (December 14). The Saxons and their allies were completely routed after a hard struggle, and Maria Theresa at last gave way. In the peace of Dresden (December 25) Frederick recognized the imperial election, and retained Silesia, as at the peace of Breisgau.

9. Operations in Italy, 1745-1747.—The campaign in Italy this year was also no mere war of posts. In March 1745 a secret treaty allied the Genoese republic with France, Spain and Naples. A change in the command of the Austrians favoured the first move of the allies. De Gages moved from Modena towards Lucea, the French and Spaniards in the Alps under Marshal Maillébois advanced through the Riviera to the Tanaro, and in the middle of July the two armies were at last concentrated between the Scrivia and the Tanaro, to the unusually large number of 80,000. A swift march on Piacenza drew the Austrian commander thither, and in his absence the allies fell upon and completely defeated the Sardinians at Bassignano (September 27), a victory which was quickly followed by the capture of Alessandria, Valenza and Casale. Jomini calls the concentration of forces which effected the victory “le plus remarquable de toute la guerre.” But the complicated politics of Italy brought it about that Maillébois was ultimately unable to turn his victory to account. Indeed, early in 1746, Austrian troops, freed by the peace with Frederick, passed through Tirol into Italy; the Franco-Spanish winter quarters were briskly attacked, and a French garrison of 6000 men at Asti was forced to capitulate. At the same time Count Browne with an Austrian corps struck at the allies on the lower Po, and cut off their communication with the main body.
in Piedmont. A series of minor actions thus completely destroyed the great concentration. The allies separated, Maillebois covering Liguria, the Spaniards marching against Browne. The last was promptly and heavily retaken in April, and all that the Spaniards could do was to entranchise themselves at Piacenza; the Spanish Infant as supreme commander calling up Maillebois to his aid. The French, skilfully conducted and marching rapidly, joined forces once more, but their situation was critical, for only two marches behind them the army of the king of Sardinia was in pursuit, and before them lay the principal army of the Austrians. The pitched battle of Piacenza (June 16) was hard fought, and Maillebois had nearly achieved a victory when orders from the Infant compelled him to retire. That the army escaped at all was in the highest degree creditable to Maillebois and to his son and chief of staff, under whose leadership it eluded both the Austrians and the Sardinians, defeated an Austrian corps in the battle of Rottofredo (August 12), and made good its retreat on Genoa. It was, however, a mere remnant of the allied army which returned, and the Austrians were soon masters of north Italy, including Genoa (September). But they met with no success in their forays towards the Alps. Soon General Thugutt’s force of 23,000 men under the command of his son, and General Gradenigo’s of 20,000 men under Lieutenant-General Sir William Pepperell (1666-1759) of Maine. Louisburg was then regarded merely as a nest of privateers, and at the peace it was given up, but in the Seven Years’ War it came within the domain of grand strategy, and its second capture was the preliminary step to the British conquest of Canada. For the war in India, see INDIA: History.

10. Later Campaigns.—The last three campaigns of the war in the Netherlands were illustrated by the now fully developed genius of Marshal Saxe. After Fontenoy the French carried all before them. The withdrawal of most of the English to aid in suppressing the Forty-Five rebellion at home left their allies in a helpless position. In 1746 the Dutch and the Austrians were driven back towards the line of the Meuse, and most of the important fortresses were taken by the French. The battle of Rocoux (or Raucourt) near Liège, fought on the 11th of October between the allies under Prince Charles of Lorraine and the French under Saxe, resulted in a victory for the latter. Holland itself was invaded, and the Saxon army was defeated, which had now conquered the Austrian Netherlands up to the Meuse, turned its attention to the United Provinces, the old fortresses on the frontier offered but slight resistance. The prince of Orange and the duke of Cumberland underwent a severe defeat at Lauffeld (Lawfield, &c., also called Val) on the end of July 1747, and Saxe, after his victory, promptly and secretly despatched a corps under (Marshall) Löwendahl to besiege Bergen-op-Zoom. On the 18th of September Bergen-op-Zoo[m] was stormed by the French, and in the last year of the war Maestricht, attacked by the entire forces of Saxe and Löwendahl, surrendered on the 7th of May 1748. A large Russian army arrived on the Meuse to join the allies, but too late to be of use. The quarrel of Russia and Sweden had been settled by the peace of Abo in 1743, and in 1746 Russia had allied herself with Austria. Eventu-ally a large army marched from Moscow to the Rhine, an event which was not without military significance, and in a manner preluded the great invasions of 1813-1814 and 1875. The general peace of Aix-la-Chapelle (Aachen) was signed on the 18th of October 1748.

11. General Character of the War.—Little need be said of the military features of the war. The intervention of Prussia as a military power was indeed a striking phenomenon, but her triumph was in a great measure due to her fuller application of principles of tactics and discipline universally recognized though less universally enforced. The other powers reorganized their forces after the war, not so much on the Prussian model as on the basis of a stricter application of known general principles. Prussia, moreover, was far ahead of all the other continental powers in administration, and over Austria, in particular, her advantage in this matter was almost decisive of the struggle. Added to this was the personal ascendency of Frederick, not yet a great general, but energetic and resolute, and, further, opposed to generals who were responsible for their men to their individual sovereigns. These advantages have been decisive in many wars, almost in all. The special feature of the war of 1740 to 1748, as of the time, was the extraordinary disparity between the end and the means. The war itself was executed by the French and other armies as grandiose as any of modern times; their execution, under the then conditions of time and space, invariably fell short of expectation, and the history of the war proves, as that of the Seven Years’ War was to prove, that the small standing army of the 18th century could conquer by degrees, but could not deliver a decisive blow. Frederick alone, with a definite end and proportionate means wherewith to achieve it, succeeded completely. The French, in spite of their later victories, obtained so little of what they fought for that Parisians could say to each other, when they met in the streets, “You are as stupid as the Peace.” And if, when fighting for their own hand, the governments of Europe could so fail of their purpose, even less was to be expected when the armies were composed of allied contingents, sent to war each for a different object. The allied national armies of 1813 co-operated loyally, for they had much at stake and worked for the common end of the war.

BIBLIOGRAPHY.—Besides general works on Frederick’s life and reign, of which Carlyle, Pakenham and v. Tarnowski are of particular importance, and Frederick’s own works, see the Prussian official Die I. und II. schlesischen Kriege (Berlin, 1890-1895); Austrian official Kriege der Kaiserin Maria Theresia (Gesch. des öster. Naval Operations.

The naval operations of this war were languid and confused. They are complicated by the fact that they were entangled with the Spanish war, which broke out in 1739 in consequence of the long disputes between England and Spain over their conflicting claims in America. Until the closing years they were conducted with small intelligence or spirit. The Spanish government was nervous, and sacrificed its true interest to the family ambition of the king Philip V., who wished to establish his younger sons as ruling princes in Italy. French administration was corrupt, and the government was chiefly concerned in its political interests in Germany. The British navy was at its lowest point of energy.
and efficiency after the long administration of Sir Robert Walpole. Therefore, although the war contained passages of vigour, it was neither interesting nor decisive on the sea.

War on Spain was declared by Great Britain on the 23rd of October 1739. It was universally believed that the Spanish colonies would fall at once before attack. Admiral Anson was put in command for conducting operations against them from east and west. One force, military and naval, was to assault them from the West Indies under Admiral Edward Vernon. Another, to be commanded by Commodore George Anson, afterwards Lord Anson, was to round Cape Horn and to fall upon the Pacific coast. Delays, bad preparations, dockyard corruption, and the unpatriotic squabbles of the naval and military officers concerned caused the failure of a hopeful scheme. On the 21st of November 1739 Admiral Vernon did indeed succeed in capturing the ill-defended Spanish harbour of Porto Bello (in the present republic of Panama)—a trifling success to boast of. But he did nothing to prevent the Spanish convoys from reaching Europe. The Spanish privateers cruised with destructive effect against British trade, both in the West Indies and in European waters. When Vernon had been joined by Sir Chaloner Ogle with naval reinforcements and a strong body of troops, an attack was made on Cartagena in what is now Colombia (November 19, 1741). The defence of the Spanish admiral, Don Blas de Lezo, was such as to prepare, and the siege failed with a dreadful loss of life to the assailants. Want of success was largely due to the incompetence of the military officers and the brutal insouciance of the admiral. The war in the West Indies, after two other unsuccessful attacks had been made on Spanish territory, died down and did not revive till 1748. The expedition under Anson sailed late, was very ill provided, and less strong than had been intended. It consisted of six ships and left England on the 18th of September 1740. Anson returned alone with his flagship the “Centurion” on the 15th of June 1744. The other vessels had either failed to round the Horn or had been lost. But Anson had harried the coast of Chile and Peru and had captured a Spanish galleon of immense value near the Philippines. His cruise was a great feat of resolution and endurance.

While Anson was pursuing his voyage round the world, Spain was mainly intent on the Italian policy of the king. A squadron was fitted out at Cadiz to convey troops to Italy. It was watched by the British admiral Nicholas Haddock. When the blockading squadron was forced off by want of provisions, the Spanish admiral Don José Navarro put to sea. He was followed, but when the British force came in sight of him Navarro had been joined by a French squadron under M. de Court (December 1741). The French admiral announced that he would support the Spaniards if they were attacked and Haddock retired. France and Great Britain were not yet openly at war, but both were engaged in the struggle in Germany—Great Britain as the ally of the queen of Hungary, Maria Theresa; France as the supporter of the Bavarian claimant of the empire. Navarro and M. de Court went on to Toulon, where they remained till February 1744. A British fleet watched them, under the command of admiral Richard Lestock, till Sir Thomas Mathews was sent out as commander-in-chief, and as minister to the court of Turin. Partial manifestations of hostility between the French and British took place in different seas, but avowed war did not begin till the French government issued its declaration of the 30th of March, to which Great Britain replied on the 31st. This formality had been preceded by French preparations for the invasion of England, and by a collision between the allies and Mathews in the Mediterranean (see Toulon, Battle of). On the 11th of February a most confused battle was fought, in which the van and centre of the British fleet was engaged with the rear and centre of the allies. Lestock, who was on the worst possible terms with his superior, took no part in the action. He despaired to excuse himself by alleging that the orders of Mathews were contradictory. Mathews, a puzzle-headed and hot-tempered man, fought with spirit but in a disorderly way, breaking the formation of his fleet, and showing no power of direction. The mismanagement of the British fleet in the battle, by arousing deep anger among the people, led to a drastic reform of the British navy which bore its first fruits before the war ended.

The French invasion scheme was arranged in combination with the Jacobite leaders, and soldiers were to be transported from Dunkirk. But though the British government showed itself in time to foresee the plot, the plan broke down. In February 1744, a French fleet and twenty sail of the line entered the Channel under Jacques Aymar, comte de Roquefeuill, before the British force under admiral John Norris was ready to oppose him. But the French force was ill equipped, the admiral was nervous, his mind dwelt on all the misfortunes which might possibly happen, and the weather was bad. M. de Roquefeuill came up almost as far as the Downs, where he learnt that Sir John Norris was at hand with twenty-five sail of the line, and thereupon precipitately retreated. The military expedition prepared at Dunkirk to cross under cover of Roquefeuill’s fleet naturally did not start. The utter weakness of the French at sea, due to long neglect of the fleet and the bankrupt state of the treasury, was shown during the Jacobite rising of 1745, when France made no attempt to profit by the distress of the British government. The Dutch having by this time joined Great Britain, made a serious addition to the naval power opposed to France, though Holland was compelled by the necessity for maintaining an army in Flanders to keep a part of its fleet in Holland for the purpose of the immense volume of trade, and having immediate interests both at home and in Germany, the British government was slow to make use of its latest naval strength. Spain, which could do nothing of an offensive character, was almost neglected. During 1745 the New England expedition which took Louisburg (April 30–June 16) was covered by a British naval force, but the operations were in a general way sporadic, subordinated to the supply of convoy, or to unimportant particular ends. In the East Indies, Mahé de la Bourdonnais made a vigorous use of a small squadron to which no effectual resistance was offered by the British naval forces. He captured Madras (July 24–September 0, 1746), a set-off for Louisburg, for which it was exchanged at the close of the war. In the same year a British combined naval and military expedition to the coast of France—the first of a long series of similar ventures which in the end were treated as “breaking windows with guineas”—was carried out during August and October. The aim was the capture of the French East India company’s dockyard at L’Orient, but it was not attained.

From 1747 till the close of the war in October 1748 the naval policy of the British government, without reaching a high level, was yet more energetic and coherent. A closer watch was kept on the French coast, and effectual means were taken to intercept communication between France and her American possessions. In the spring information was obtained that an important convoy for the East and West Indies was to sail from L’Orient. In the previous year the British government had allowed a French expedition under M. d’Anville to fail mainly by its own weakness. In 1747 a more creditable line was taken. An overwhelming force was employed under the command of Anson to intercept the convoy in the Channel. It was met, crushed and captured, or driven back, on the 3rd of May. On the 14th of October another French convoy, protected by a strong squadron, was intercepted by a well-appointed and well-directed squadron of superior numbers—the squadrons were respectively eight French and fourteen British—in the Bay of Biscay. The French admiral Desherbiers de l’Étenduère made a very gallant resistance, and the fine quality of his ships enabled him to counteract to some extent the superior numbers of Sir Edward Hawke, the British admiral. While the war-ships were engaged, the merchant vessels, with the small protection which Desherbiers could spare them, continued on their way to the West Indies. Most of them were, however, intercepted and captured in those waters. This disaster convinced the French government of its helplessness at sea, and it made no further effort.

The last naval operations took place in the West Indies, where the Spaniards, who had for a time been treated as a negligible quantity, were attacked on the coast of Cuba by a British
squadron under Sir Charles Knowles. They had a naval force under Admiral Regio at Havana. Each side was at once anxious to cover its own trade, and to intercept that of the other. Capture was rendered particularly desirable to the British by the fact that the Spanish homeward-bound convoy would be laden with the bullion sent from the American mines. In the course of the movement of each to protect its trade, the two squadrons met on the 1st of October 1748 in the Bahama Channel. The action was indecisive when compared with the successes of British fleets in later days, but the advantage lay with Sir Charles Knowles. He was prevented from following it up by the speedy receipt of the news that peace had been made in Europe by the powers, who were all in various degrees exhausted. That it was arranged on the terms of a mutual restoration of conquests shows that none of the combatants could claim to have established a final superiority. The conquests of the French in the Bay of Bengal, and their military successes in Flanders, enabled them to treat on equal terms, and nothing had been taken from Spain.

The war was remarkable for the prominence of privateering on both sides. It was carried on by the Spaniards in the West Indies with great success, and actively at home. The French were no less active in all seas. Mahé de la Bourdonnais's attack on Madras partook largely of the nature of a privateering venture. The British retaliated with vigour. The total number of captures by French and Spanish corsairs was in all probability larger than the list of British—partly for the reason given by Voltaire, namely, that more British merchants were taken because there were many more British merchant ships to take, but partly also because the British government had not yet begun to enforce the use of convoy so strictly as it did in later times.

See Beaton's Naval and Military Memoirs (London, 1804); La Marine militaire de la France sous le règne de Louis XV, by G. Lacour-Gayet (Paris, 1902); The Royal Navy, by Sir W. L. Clowes and others (London, 1891, &c.).

AUTHENTIC (from Gr. ἀθέτης, one who does a thing himself), genuine, as opposed to counterfeit, true or original. In music it is one of the terms used for the ecclesiastical modes.

AUTOCERALOUS (from Gr. αὐτός, self, and κεφαλή, head), of independent headship, a term used of certain ecclesiastical functionaries and organizations.

AUTOCRATOR (Gr. αὐτοκράτεια, absolute power), a term applied to that form of government which is absolute or irresponsible, and vested in one single person. It is a type of government usually found amongst eastern peoples; amongst more civilized nations the only example is that of Russia, where the sovereign assumes as a title "the autocrat of all the Russians."

AUTO-DA-FÉ, more correctly AUTO-DE-FÉ (act of faith), the name of the ceremony during the course of which the sentences of the Spanish inquisition were read and executed. The auto-da-fé was almost identical with the sermo generalis of the medieval inquisition. It never took place on a feast day of the church, but on some famous anniversary: the accession of a Spanish monarch, his marriage, the birth of an infant, &c. It was public: the king, the royal family, the grand councils of the kingdom, the court and the people being present. The ceremony comprised a procession in which the members of the Holy Office, with its familiar agents, the condemned persons and the penitents took part; a solemn mass; an oath of obedience to the inquisition, taken by the king and the all the lay functionaries; a sermon by the Grand Inquisitor; and the reading of the sentences, followed by condemnation or acquittal, delivered by the Holy Office. The handing over of condemned persons, and those who had relapsed, to the secular power, and their punishment, did not usually take place on the occasion of an auto-da-fé, properly so called. Sometimes those who were condemned to the flames were burned on the night following the ceremony. The first great auto-da-fés were celebrated when Thomas de Torquemadas was at the head of the Spanish inquisition (Seville 1482, Toledo 1486, &c.). The last, subsequent to the time of Charles III., were held in secret; moreover, they dealt with only a very small number of sentences, of which hardly any were capital. The isolated cases of the torturing of a revolutionary priest in Mexico in 1816, and of a relapsed Jew and of a Quaker in Spain during 1826, cannot really be considered as auto-da-fés. (P. A.)

AUTOGRAM (from Gr. αὐτός, self, and γαμία, marriage), a botanical term for self-fertilization. (See Autogamous.)

AUTOGENY, AUTOGENOUS (Gr. αὐτογενής), spontaneous generation, self-produced. Haeckel distinguished autogeny and plasmogeny, applying the former term when the formative fluid in which the first living matter was supposed to arise was inorganic and the latter when it was organic, i.e., contained the requisite fundamental substances dissolved in the form of complicated and fluid combinations of organic substances. In "autogenous soldering" two pieces of metal are united by the melting of the opposing surfaces, without the use of a separate fusible alloy or solder as a cementing material.

AUTOGRAPHS. Autograph (Gr. αὐτός, self, γράφων, to write) is a term applied by common usage either to a document signed by the person from whom it emanates, or to one written entirely by the hand of such person (which, however, is also more technically described as holograph, from ἴλος, entire, γράφων, to write), or simply to an independent signature.

The existence of autographs must necessarily have been coeval with the invention of letters. Documents in the handwriting of their composers may possibly exist among the early papyri of Egypt and the clay tablets of Babylonia and Assyria, and among the early examples of writing in the East. But the oriental practice of employing professional scribes in writing the body of documents and of using seals for the purpose of "signing" (the "signum" originally meaning the impression of the seal) almost precludes the idea. When we are told (1 Kings xxi. 8) that Jezebel wrote letters in Ahab's name and sealed them, we are not to understand that the letters were written by the professional scribes and that the impression of the king's seal was the authentication, equivalent to the signature of western nations; and again, when King Darius "signed" the writing and the decree (Dan. vi. 10), he did so with his seal. To find documents which we can
recognize with certainty to be autographs, we must descend to the Ptolemaic and Roman periods of Egyptian history, which are represented by an abundance of papyrus documents of all kinds, chiefly in Greek. Among them are not a few original letters and personal documents, in which we may see the handwriting of many lettered and unlettered individuals who lived during the 3rd century B.C. and in succeeding times, and which prove how very widespread was the practice of writing in those days. We owe it to the dry and even atmosphere of Egypt that these written documents have been preserved in such numbers. On the other hand, in Italy and Greece ancient writings have perished, save the few charred papyrus rolls and waxen tablets which have been recovered from the ruins of Herculaneum and Pompeii. These tablets, however, have a special value, for many of them contain autograph signatures of principals and witnesses to legal deeds to which they were attached, together with impressions of seals, in compliance with the Roman law which required the actual subscriptions, or attested marks, of the persons concerned.

But, when we now speak of autographs and autograph collections, we use such terms in a restricted sense and imply documents or signatures written by persons of some degree of eminence or notoriety in the various ranks of society. Naturally the only early autographs in this sense which could be expected to survive are the subscriptions and signatures of royal personages and great officials attached to important public deeds, which from their nature have been more jealously cared for than mere private documents.

Following the Roman practice, subscriptions and signatures were required in legal documents in the early centuries of our era. Hence we find them in the few Latin deeds on papyrus which have come to light in Egypt; we find them on the well-known Dacian waxen tablets of the 2nd century; and we find them in the series of papyrus deeds from Ravenna and other places in Italy between the 5th and 7th centuries. The same practice obtained in the Frankish empire. The Merovingian kings, or at least those of them who knew how to write, subscribed their diplomas and great charters with their own hands; and their great officers of state, chancellors and others, countersigned in autograph. The unlettered Merovingian kings made use of the signatures composed of the letters of their names; and, curiously, the illiterate monks added their signatures to the literate subscriptions. For the monogram was adopted by Charlemagne and his successors as a recognized symbol of their subscription. It was their signum manucale, their sign manual.

In courtly imitation of the royal practice, monograms and other marks were adopted by official personages, even though they could write. The notarial marks of modern times are a survival of the practice. By the illiterate other signs, besides the monogram, came to be employed, such as the cross, &c., as signs manual. The monogram was used by French monarchs from the reign of Charlemagne to that of Philip the Fair, who died in 1314. It is very doubtful, however, whether in any instance this sign manual was actually traced by the monarch's own hand. At the most, the earlier sovereigns appear to have drawn one or two strokes in their monograms, which, so far, may be called their autographs. But in the later period not even this was done; the monogram was entirely the work of the scribe. (See Diplomatic.)

The employment of marks or signs manual went out of general use after the 12th century, in the course of which the affixing or appending of seals became the common method of executing deeds. But, as education became more general and the practice of writing more widely diffused, the usage grew up in the course of the 14th century of signing the name-signature as well as of affixing the seal; and by the 15th century it had become established, and it remains to the present time. Thus the signum manucale had disappeared, except among notaries; but the term survived, and by a natural process it was transferred to the signature. In the present day it is used to designate the "sign manual" or autograph signature of the sovereign.

The Anglo-Saxon kings of England did not sign their charters, their names being invariably written by the official scribes. After the Norman conquest, the sign manual, usually a cross, which sometimes accompanied the name of the sovereign, may in some instances be autograph; but the Royal signature is to be found earlier than the reign of Richard II. Of the signatures of this king there are two examples, of the years 1386 and 1389, in the Public Record Office; and there is one, of 1397, in the British Museum. Of his father, the Black Prince, there is in the Record Office a motto-signature, De par Homont (high courage), Ich dene, subscribed to a writ of privy seal of 1370. The kings of the Lancastrian line were apparently ready writers. Of the handwriting of both Henry IV. and Henry V. there are specimens both in the Record Office and in the British Museum. But by their time writing had become an ordinary accomplishment.

Apart from the autographs of sovereigns, those of famous men of the early middle ages can hardly be said to exist, or, if they do exist, they are difficult to identify. For example, there is a charter at Canterbury bearing the statement that it was written by Dunstan; but, as there is a duplicate in the British Museum with the same statement, it is probable that both the one and the other are copies. The autograph MSS. of the chronicles of Ordericus Vitalis, of Robert de Monte, and of Sigebert of Gembloux, in existence; and among the Cottonian MSS. there are undoubted autograph writings of Matthew of Paris, the English chronicler of Henry III.'s reign. There are certain documents in the British Museum in the hand of William of Wykeham; and among French archives there are autograph writings of the historian Joinville. These are a few instances. When we come to such a collection as the famous Paston Letters, the correspondence of the Norfolk family of Paston of the 15th century, we find therein numerous autographs of historical personages of the time.

From the 16th century onward, we enter the period of modern history, and autograph documents of all kinds become plentiful. And yet in the midst of this plenty, by a perverse fate, there is in certain instances a remarkable dearth. The instance of Shakespeare is the most famous. But for three signatures to the three sheets of his will, and two signatures to the conveyances of property in Blackfriars, we should be without a vestige of his handwriting. For certain other signatures, professing to be his, inscribed in books, may be dismissed as imitations. Such forgeries come up from time to time, as might be expected, and are placed among other specimens of Dacian forgeries, however, of W. H. Ireland were perpetrated rather with a literary intent than as an autographic venture.

Had autograph collecting been the fashion in Shakespeare's days, we should not have had to deplore the loss of his and of other great writers' autographs. But the taste had not then come into vogue, at least not in England. The series of autograph documents which were gathered in such a library as that of Sir Robert Cotton, now in the British Museum, found their way thither on account of their literary or historic interest, and not merely as specimens of the handwriting of distinguished men. Such a series also as that formed by Philippe de Béthune, Comte de Selles et Charost, and his son, in the reign of Louis XIV., consisting for the most part of original letters and papers, now in the Bibliothèque Nationale, might have been regarded as the result of autograph collecting did we not know that it was brought together for historical purposes. It was in Germany and the Low Countries that the practice appears to have originated, chiefly among students and other members of the public of collecting autographs and signatures of one's friends in albums, alba amicorum, little oblong pocket volumes of which a considerable number have survived, a very fair collection being in the British Museum. The earliest album in the latter series is the Egerton MS. 1178, beginning with an entry of the year 1554. Once the taste was established, the collecting of autographs of living persons was naturally extended to those of former times; and many collections, famous in their day, have been formed, but in most instances only to be dispersed again as the owners tired of their fancy or as their heirs failed to inherit their tastes along with their
AUTOLYCUS—AUTOMATIC WRITING

47

possessions. The most celebrated collection formed in England in recent years is that of the late Mr. Alfred Morrison, which still remains intact, and which is well known by means of the sumptuous catalogue, with its many facsimiles, compiled by the owner.

The rivalry of collectors and the high prices which rare or favourite autographs realize have naturally given encouragement to the forger. False letters of popular heroes and of popular authors, of Nelson, of Burns, of Thackeray, and of others, appear from time to time in the market: in some instances clever imitations, but more generally too palpably spurious to deceive any one with experience. Like the Shakespearean forgeries of Ireland, referred to above, the forgeries of Chatterton were literary inventions; and both were poor performances. One of the cleverest frauds of this nature in modern times was the fabrication, in the middle of the 19th century, of a series of letters of Byron and Shelley, with postmarks and seals complete, which were even published as bona fide documents (Brit. Mus., Add. MS. 19,377).

There are many published collections of facsimiles of autographs of different nations. Among those published in England the following are well known: Autographs and Autograph Facsimiles of Englishmen (London, 1852); Autographs, by J. Smith (1853), with supplement by Daniell (1854); Autographs of Royal, Noble, Learned and Remarkable Personages in English History, by J. G. Nichols (1853); Facsimiles of Original Documents of Eminent Literary Characters, by R. Sims (1854); Facsimiles of the Autographs of Poets, Authors, and Queens and Eminent Men of Great Britain, by J. Netherclift (1835); One Hundred Characteristic Autograph Letters, by J. Netherclift and Son (1843); The Autograph Miscellany, by F. Netherclift (1853); Autograph Mirror or Beauties of Autographs (1856); The Autographic Mirror (1864—1866); The Hand-Book of Autographs, by F. G. Netherclift (1862); The Autograph Album, by L. B. Phillips (1866); Facsimiles of Autographs (British Museum publication), five series (1866—1869). Facsimiles of Autographs also appear in the official publications, Facsimiles of National MSS., from William the Conqueror to Queen Anne (Lord of the Rolls), 1865—1868; Facsimiles of National MSS. of Scotland (Lord Clerk Register), 1867—1871; and Facsimiles of National MSS. of Ireland (Public Record Office, Ireland), 1875—1876. (E. M. T.)

AUTOLYCUS, in Greek mythology, the son of Hermes and father of Anticlea, mother of Odysseus. He lived at the foot of Mount Parnassus, and was famous as a thief and swindler. On one occasion he met his match. Sisyphus, who had lost some cattle, suspected Autolycus of being the thief, but was unable to bring it home to him, since he possessed the power of changing everything that was touched by his hands. Sisyphus accordingly burnt his name into the hoofs of his cattle, and, during a visit to Autolycus, recognized his property. It is said that on this occasion Sisyphus seduced Autolycus's daughter Anticlea, and that Odysseus was really the son of Sisyphus, not of Laertes, whom Anticlea afterwards married. The object of the story is to establish the close connexion between Hermes, the god of theft and cunning, and the three persons—Sisyphus, Odysseus, Autolycus—who are the incarnate representations of these practices. Autolycus is also said to have instructed Heracles in the art of wrestling, and to have taken part in the Argonautic expedition.

ANR, p. 267; Odyssee, xiii. 395; Ovid, Metam. xi. 317; Apollodorus i. 9; Hyginus, Fab. 201.

AUTOLYCUS OF PITANE, Greek mathematician and astronomer, probably flourished in the second half of the 4th century b.c., since he is said to have instructed Aratos. His extant works consist of two treatises; the one, Περὶ κυκλωμάτων σφαιρας, contains some simple propositions on the motion of the sphere, the other, Περὶ κτιστολόγου καὶ διόσκουρων, in two books, discusses the rising and setting of the fixed stars. The former treatise is historically interesting for the light it throws on the development which the geometry of the sphere had already reached even before Autolycus and Euclid (see Theodosius of Trèves).

There are several Latin versions of Autolycus, a French translation by Forradel (1572), and an admirable edition of the Greek text with Latin translation by F. Hultsch (Leipzig, 1885).

AUTOMATIC WRITING, the name given by students of psychical research to writing performed without the volition of the agent. The writing may also take place without any consciousness of the words written; but some automatists are aware of the word which they are actually writing, and perhaps of two or three words on either side, though there is rarely any clear perception of the meaning of the whole. Automatic writing may take place when the agent is in a state of trance, spontaneous or induced, in hystero-epilepsy or other morbid states; or in a condition not distinguishable from normal wakefulness. Automatic writing has played an important part in the history of modern spiritualism. The phenomenon first appeared on a large scale in the early days (c. 1850—1860) of the movement in America. Numerous writings are reported at that period, many of considerable length, which purported for the most part to have been produced under spiritual guidance. Some of these were written in "unknown tongues." Of those which were published the most notable are Andrew J. Davis's Great Harmonia, Charles Linton's The Healing of the Nations, and J. Murray Spear's Messages from the Spirit Life.

In England also the early spiritualist newspapers were filled with "inspirational" writing.—Pages of the Paraclete, &c. The most notable series of English automatic writings are the Spirit Teachings of the Rev. W. Stanton Moses. The phenomenon, of course, lends itself to deception, but there seems no reason to doubt that in the great majority of the cases recorded the writing was in reality produced without deliberate volition. In the earlier years of the spiritualist movement, a "planchette," a plane being used to write with the aid of a long stick on wheels, was employed to facilitate the process of writing.

Of late years, whilst the theory of external inspiration as the cause of the phenomenon has been generally discredited, automatic writing has been largely employed as a method of experimentally investigating subconscious mental processes. Knowledge which had lapsed from the primary consciousness is frequently revealed by this means; e.g. forgotten fragments of poetry or foreign languages are occasionally given. An experimental parallel to this reproduction of forgotten knowledge was devised by Edmund Gurney. He showed that information communicated to a subject in the hypnotic trance could be subsequently reproduced through the handwriting, whilst the attention of the subject was fully employed in conversing or reading aloud; or an arithmetical problem which had been set during the trance could be worked out under similar conditions without the apparent consciousness of the subject.

Automatic writing for the most part, no doubt, brings to the surface only the débris of lapsed memories and half-formed impressions which have never reached the focus of consciousness—the stuff that dreams are made of. But there are indications in the automatic writings of some unconscious mental processes in instances the writing produces anagrams, puns, nonsense verses and occasional blasphemies or obscenities; and otherwise exhibits characteristics markedly divergent from those of the normal consciousness. In the well-known case recorded by Th. Flournoy (Des Indes à la planète Mars) the automaticist produced writing in an unknown character, which purported to be the Martian language. The writing generally resembles the ordinary handwriting of the agent, but there are sometimes marked differences, and the same automatist may employ two or three distinct handwriting. Occasionally imitations are produced of the handwriting of other persons, living or dead. Not infrequently the writing is reversed, so that it can be read only in a looking-glass (Spiegelschrift); the ability to produce such writing is often associated with the liability to spontaneous somnambulism. The hand and arm are often insensible in the act of writing. There are some cases on record in which the automatist has seemed to guide his hand not by sight, but by some special extension of the muscular sense (Carpenter, Mental Physiology, § 128; W. James, Proceedings American S.P.R., p. 554).

Automatic writing frequently exhibits indications of telepathy. The most remarkable series of automatic writings recorded in this connexion are those executed by the American medium, Mrs. Piper, in a state of trance (Proceedings S. P. R.). These writings appear to exhibit remarkable telepathic powers, and are thought by some to indicate communication with the spirits of the dead.
The opportunities afforded by automatic writing for communica-
ting with subconscious strata of the personality have been made
use of by Pierre Janet and others in cases of hystero-
epilepsy, and other forms of dissociation of consciousness.
A patient in an attack of hysterical convulsions, to whom oral
appeals are made in vain, can sometimes be induced to answer in
writing questions addressed to the hand, and thus to reveal the
secret of the malady or to accept therapeutic suggestions.

*L'Automatisme psychologique* (2nd ed., Paris, 1894); Morton Prince,

**AUTOMATISM.** In philosophical terminology this word is
used in two main senses: (1) in ethics, for the view that man
is not responsible for his actions, which have, therefore, no moral
value; (2) in psychology, for all actions which are not the result
of conation or conscious endeavour. Certain actions being
admittedly automatic, Descartes maintained that, in regard of the
lower animals, all action is purely mechanical. The same
theory has since been applied to man, with this difference that,
accompanying the mechanical phenomena of action, and entirely
disconnected with it, are the phenomena of consciousness. Thus
certain local changes in the brain result in a given action;
the concomitant mental desire or volition is in no sense causally
connected with, or prior to, the physical change. This
theory, which has been maintained by T. Huxley (*Science and Culture*
and Shadworth Hodgson (*Metaphysic of Experience and Theory of
Practice*), must be distinguished from that of the psychophysical
parallelism, or the "double aspect theory" according to which both
the mental state and the physical phenomena result from a
so-called "mind stuff," or single substance, the material or cause
of both.

Automatic acts are of two main kinds. Where the action
goes on while the attention is focused on entirely different
subjects (e.g. in cycling), it is purely automatic. On the other
hand, if the attention is fixed on the end or on any particular
part of a given action, and the other component parts of the action
are performed unconsciously, the automatism may be called
relative.

of Psych.* i. chap. 5; also the articles PSYCHOLOGY, SUGGESTION, &c.

**Sensory Automatism** is the term given by students of psychical
research to a centrally initiated hallucination. Such hallucina-
tions are commonly provoked by crystal-gazing (*q.e.*), but
auditory hallucinations may be caused by the use of a shell
(shell-hearing), and the other senses are occasionally affected.

**Motor Automatism,** on the other hand, is a reflex movement
of a voluntary muscle, executed in the waking state but not
controlled by the ordinary waking consciousness. Phenomena
of this kind play a large part in primitive ceremonies of divina-
tion (*q.e.*) and in our own day furnish much of the material
of Psychical Research. At the lowest level we have vague move-
ments of large groups of muscles, as in "bier-divination," where
the murderer or his residence is inferred from the actions of the
bearers; of a similar character but combined with more specialized
action are many kinds of witch seeking. These more specialized
actions are most typically seen in the Divining Rod (*q.e.*; see
also TABLE-TURNING), which indicates the presence of water
and is used among the uncivilized to trace criminals. At a
higher stage still we have the delicate movements necessary for
Automatic Writing (*q.e.*) or Drawing. A parallel case to
Automatic Writing is the action of the speech centres, resulting
in the production of all kinds of utterances from trance speeches
in the ordinary language of the speaker to mere unintelligible
babblings. An interesting form of speech automatism is known
as Glossolalia; in the typical case of Helène Smith, Th. Flournoy
has shown that these utterances may raise a higher plane and
form a real language, which is, however, based on one already
known to the speaker.

S.P.R. ix. 26, xii. 277, xv. 403; Flournoy, *Des Indes à la planète
Mars* and in *Arch. de Psychologie; Myers, Human Personality.*

(N. W. T.)

**AUTOMATON** (from αὐτός, self, and ὁμοίω, to seize), a self-moving
machine, or one in which the principle of motion is contained
within the mechanism itself. According to this description,
clothes-watches and all machines of a similar kind, are automatons,
but the word is generally applied to contrivances which simulate
for a time the motions of animal life. If the human figure
and actions be represented, the automaton has sometimes been called
spatially an androïdes. We have very early notices of the con-
struction of automatons, e.g. the tripods of Vulcan, and the moving
figures of Daedalus. In 400 B.C., Archytas of Tarentum is said
to have made a wooden pigeon that could fly, and during the
middle ages numerous instances of the construction of automatons
are recorded. Regiomontanus is said to have made of iron a fly,
which would flutter round the room and return to his hand,
and also an eagle, which flew before the emperor Maximilian
when he was entering Nuremberg. Roger Bacon is said to have
forged a brazen head which spoke, and Albertus Magnus to have
had an androides, which acted as doorkeeper, and was broken
to pieces by Aquinas. Of these, as of some later instances, e.g.
the figure constructed by Descartes and the automata exhibited
by Dr Camus, not much is accurately known. But in the
18th century, Jacques de Vaucanson, the celebrated mechanician,
exhibited three admirable figures,—the flute-player, the tambou-
rin-player, and the duck, which was capable of eating, drinking,
and finally of singing, and imitating exactly the natural voice of that fowl.
The means by which these results had been produced were
clearly seen, and a great impulse was given to the construction
of similar figures. Knauss exhibited at Vienna an automaton
which wrote; a father and son named Droz constructed several
ingenious mechanical figures which wrote and played music;
Frederick Kaufmann and Leonard Maelzel made automatic
trumpeters who could play several marches. The Swiss have
always been celebrated for their mechanical ingenuity, and they
construct most of the curious toys, such as flying and singing
birds, which are frequently met with in industrial exhibitions.
The greatest difficulty has generally been experienced in devising
any mechanism which shall successfully simulate the human
voice (not to be compared with the gramophone, which repro-
duces mechanically a real voice). No attempt has been
thoroughly successful, though many have been made. A figure
exhibited by Faberbach of Vienna remains the best. Kempelen's
famous chess-player for many years astonished and puzzled
Europe. This figure, however, was no true automaton, although
the mechanical contrivances for concealing the real performer
and giving effect to his desired movements were exceedingly
ingenious. J. N. Maskelyne, in more recent times (1875–1880),
has been prominent in exhibiting his automata, Psycho (*who
played cards*) and Zoe (*who drew pictures*), at the Egyptian
Hall, London, but the secret of these contrivances was well kept.
(See CONJURING.)

**AUTOMORPHISM** (from Gr. αὐτός, self, and μορφή, form),
the conception and interpretation of other people's habits and ideas
on the analogy of one's own.

**AUTONOMY** (Gr. αὐτός, self, and νόμος, law), in general,
freedom from external restraint, self-government. The term is
usually coupled with a qualifying adjective. Thus, political
autonomy is self-government in its widest sense, independence
of all control from without. Local autonomy is a freedom of
self-government within a sphere marked out by some superior
authority; e.g. municipal corporations in England have their
administrative powers marked out for them by acts of parliament,
and in so far as they govern themselves within these limits
exercise local autonomy. Administrative or constitutional
autonomy, such as exists in the British colonies, implies an
extent of self-government which falls short only of complete
independence. The term is used loosely even in the case of e.g.
religious bodies, individual churches and other communities
which enjoy a measure of self-government in certain specified respects.

In philosophy, the term (with its antithesis "heteronomy") was applied by Kant to that aspect of the rational will in which qua rational, it is a law to itself, independently of any external authority, of the reflective experience and of the impulses of pleasure and pain. In the sphere of morals, the ultimate and only authority which the mind can recognize is the law which emerges from the pure moral consciousness. This is the only sense in which moral freedom can be understood. (See ETICS: KANT.) Though the term "autonomy" in its fullest sense implies entire freedom from causal necessity, it can also be used even in determinist theories for relative independence of particular conditions, theological or conventional.

AUTOPSY (Gr, άνθν, self, and δεφιν, sight, investigation), a personal examination, typically a post-mortem ("after death") examination of a dead body, to ascertain the cause of death, &c. The term "necropsy" (Gr, νεκρός, corpse) is sometimes used in this sense. (See CORONER AND MEDICAL JURISPRUDENCE.)

AUTAN, JOSEPH (1813–1877), French poet, was born at Marseilles on the 20th of June 1813. In 1832 he addressed an ode to Lamartine, who was then at Marseilles on his way to the East. The elder poet persuaded the young man's father to allow him to follow his poetic bent, and Autran remained from that time a faithful disciple of Lamartine. His best known work is Le Mer (1835), remodelled in 1852 as Des Poèmes de la mer. Ludibria ventis (1838) followed, and the success of these two volumes gained for Autran the librarianship of his native town. His other most important work is his Vie rurale (1846), a series of pictures of peasant life. The Algerian campaigns inspired him with verses in honour of the common soldier. Milicanh (1842) describes the heroic defence of that town, and in the same vein is his Labourers et soldats (1854). Among his other works are the Paroles de Salomon (1868), Épître rustiques (1861), Sonnets capricieux, and a tragedy played with great success at the Odéon in 1848, La Fille d'Eschyle. A definitive edition of his works was brought out between 1875 and 1881. He became a member of the French Academy in 1868, and died at Marseilles on the 6th of March 1877.

AUTAN, a town of east-central France, capital of an arrondissement in the department of Saône-et-Loire, 62 m. S.W. of Dijon on the Paris-Lyon railway to Nevers. Pop. (1906) 11,927. Autun is pleasantly situated on the slope of a hill at the foot of which runs the Arroux. Its former greatness is attested by many Roman remains, the chief of which are two well-preserved stone gateways, the Porte d'Arroux and the Porte St André, both pierced with four archways and surrounded by arcades. There are also remains of the old ramparts and aqueducts, of a square tower called the Temple of Janus, of a theatre and of an amphitheatre. A pyramid in the neighbouring country of Couhard was probably a sepulchral monument. The chapel of St Nicolas (12th century) contains many of the remains discovered at Autun. The cathedral of St Lazare, once the chapel attached to the residence of the dukes of Burgundy, is in the highest part of the town. It belongs mainly to the 12th century, but the Gothic central tower and the chapels were added in the 15th century by Nicolas Rolin, chancellor of Burgundy, born at Autun. The chief artistic features of the church are the group of the Last Judgment sculptured on the tympanum above the west door, and the painting by Ingres representing the martyrdom of St Symphorien, which took place at Autun in 179. In the cathedral square stands the fountain of St Lazare, a work of the Renaissance. The hôtel Rolin, a house of the 15th century, contains the collections of the "Aeduan literary and scientific society." The hôtel de ville, containing a museum of paintings, the law-court and the theatre are modern buildings. Autun is the seat of a bishopric, of tribunals of first instance and of commerce, and has an ecclesiastical seminary, a communal college and a cavalry school. Among the industries of the town are the extraction of oil from the bituminous schist obtained in the neighbourhood, leather manufacture, metal-foundering, marble-working, and the manufacture of machinery and furniture. Autun is the commercial centre for a large part of the Morvan, and has considerable trade in timber and cattle.

Autun (Augustodunum) succeeded Bibracte as capital of the Aedui when Gaul was reorganized by Augustus. Under the Romans, it was a flourishing town, covering double its present extent and renowned for its schools of rhetoric. In the succeeding centuries its prosperity drew upon it the attacks of the barbarians, the Saracens and the Normans. The counts of Autun in 880 became dukes of Burgundy, and the town was the residence of the latter till 1276. It was ravaged by the English in 1379, and, in 1591, owing to its support of the League, had to sustain a siege conducted by Marshal Jean d'Aumont, general of Henry IV.

See H. de Fontenay, Autun et ses monuments (Autun, 1869).

AUTUNITE, or CALCO-URANITE, a mineral which is one of the "uranium micas," differing from the more commonly occurring torbernite (q.v.) or cupro-uranite in containing calcium in place of copper. It is a hydrous uranium and calcium phosphate, Ca (UO₂)₂(PO₄)₁⁺₈ (or 12) H₂O. Though closely resembling the tetragonal torbernite in form, it crystallizes in the orthorhombic system and is optically biaxial. The crystals have the shape of thin plates with very nearly square outline (8° 17' instead of 90'). An important character is the perfect micaceous cleavage parallel to the basal plane on which plane the lustre is pearly. The colour is sulphur-yellow, and this enables the mineral to be distinguished at a glance from the emerald-green torbernite. Hardness 2-2½; specific gravity 2-05-2-19. Autunite is usually found with pitchblende and other uranium minerals, or with ores of silver, tin and iron; it sometimes coats joint-planes in gneiss and pegmatite. Falkenstein in Saxony, St Symphorien near Autun (hence the name of the species), and St Day in Cornwall are well-known localities for this mineral.

AUVERGNE, formerly a province of France, corresponding to the departments of Cantal and Puy-de-Dôme, with the arrondissement of Brioude in Haute-Loire. It contains many mountains volcanic in origin (Pliomb du Cantal, Puy de Dôme, Mont Dore), fertile valleys such as that of Limagne, vast pasturages, and numerous medicinal springs. Up to the present day the population retains strongly-marked Celtic characteristics.

In the time of Caesar the Arverni were a powerful confederation, the Arvernian Verecogitorix being the most famous of the Gallic chieftains who fought against the Romans. Under the empire Arvernia formed part of Prima Aquitania, and the district shared in the fortunes of Aquitaine during the Merovingian and Carolingian periods. Auvergne was the seat of a separate countship before the end of the 8th century; the first hereditary count was William the Pious (886). By the marriage of Eleanor of Aquitaine to Henry Plantagenet, the countship passed under the suzerainty of the kings of England, but at the same time it was divided, William VII., called the Young (1145–1168), having been despoiled of a portion of his domain by his uncle William VIII., called the Old, who was supported by Henry II. of England, so that he only retained the region bounded by the Allier and the Coir. It is this district that from the end of the 13th century was called the Dauphiné d'Auvergne. This family quarrel occasioned the intervention of Philip Augustus, king of France, who succeeded in possessing himself of a large part of the country, which was annexed to the royal domains under the name of Terre d'Auvergne. As the price of his concurrence with the king in this matter, the bishop of Clermont, Robert I. (1195–1227), was granted the lordship of the town of Clermont, which subsequently became a countship. Such was the origin of the four great historic lordships of Auvergne. The Terre d'Auvergne was first an appanage of Count Alphonse of Poitiers (1241–1271), and in 1360 was erected into a duchy in the peerage of France (ducé-pairie) by King John II. In favour of his son John, through whose daughter the new title passed in 1416 to the house of Bourbon. The last duke, the celebrated constable Charles of Bourbon, united the domains of the Dauphiné to those of the
AUXANOMETER—

... but all were confiscated by the crown in consequence of the sentence which punished the constable's treason in 1537. The countship, however, had passed in 1422 to the house of La Tour, and was not annexed to the domain until 1615. The administration of the royal province of Auvergne was organized under Louis XIV. At the time of the revolution it formed what was called a "government," with two divisions: Upper Auvergne (Aurillac), and Lower Auvergne (Clermont).

AUXANOMETER (Gr. αυξανωντης, to increase, μετρον, measure), an apparatus for measuring increase or rate of growth in plants.

AUXENTIUS (fl. c. 370), of Cappadocia, an Arian theologian of some eminence (see Arius). When Constantine deposed the orthodox bishops who resisted, Auxentius was installed into the seat of Dionysius, bishop of Milan, and came to be regarded as the great opponent of the Nicene doctrine in the West. So prominent did he become, that he was specially mentioned by name in the condemnatory decree of the synod which Damasus, bishop of Rome, urged by Athanasius, convened in defence of the Nicene doctrine (A.D. 369). When the orthodox emperor Valentinian ascended the throne, Auxentius was left undisturbed in his diocese, but his theological doctrines were publicly attacked by Hilary of Poitiers.

The chief source of information about him is the Liber contra Auxentium in the Benedictine edition of the works of Hilary.

AUXERRE, a town of central France, capital of the department of Yonne, 38 m. S.S.E. of Sens on the Paris-Lyon railway, between Laroche and Nevers. Pop. (1906) 19,971. It is situated on the slopes and the summit of an eminence on the left bank of the Yonne, which is crossed by two bridges leading to suburbs on the right bank. The town is irregularly built and its streets are steep and narrow, but it is surrounded by wide tree-lined boulevards, which have replaced the ancient fortifications, and has some fine churches. That of St Étienne, formerly the cathedral, is a majestic Gothic building of the 13th to the 16th centuries. It is entered by three richly sculptured portals, over the middle and largest of which is a rose window; over the north portal rises a massive tower, but that which should surmount the south portal is unfinished. The lateral entrances are sheltered by tympana and arches profusely decorated with statuettes. The plan consists of a nave, with aisles and lateral chapels, transept and choir, with a deambulatory at a slightly lower level. Beneath the choir, which is a fine example of early Gothic architecture, extends a crypt of the 11th century with mural paintings of the 12th century. The church has some fine stained glass and many pictures and other works of art. The ancient episcopal palace, now used as prefecture, stands behind the cathedral; it preserves a Romanesque gallery of the 12th century. The church of St Eusèbe belongs to the 12th, 13th and 14th centuries. The chapel of St Germain, built in the 13th and 14th centuries, most of the nave has disappeared, so that the lofty, imposing Romanesque tower stands apart from it; crypts of the 12th century contain the tombs of bishops of Auxerre. The abbey was once fortified and a high wall and cylindrical tower remain. The buildings (18th century) are partly occupied by a hospital and a training-college. The church of St Pierre, in the Renaissance style, is ornamented with its west façade.

The old law-court contains antiquities and paintings, and a library. In the middle of the town is a gateway surmounting the 15th century. Auxerre has statues and other public buildings.

AUXERRE (Gr. αυξανωντης, to increase, μετρον, measure), an apparatus for measuring increase or rate of growth in plants.

The canal of Nivernais reaches as far as Auxerre, which has a busy port and carries on boat-building. Trade is principally in the choice wine of the surrounding vineyards, and in timber and coal.

Auxerre (Autessiodurum) became the seat of a bishop and a civitas in the 3rd century. Under the Merovingian kings the abbey of St Germain, named after the 6th bishop, was founded, and in the 9th century its schools had made the town a seat of learning. The bishopric was suppressed in 1790.

The countship of Auxerre was granted to King Robert I. to his son-in-law Renaud, count of Nevers. It remained in the house of Nevers until 1184, when it passed by marriage to that of Courtenay. Other alliances transferred it successively to the families of Donzy, Châtillon, Bourbon and Burgundy. Alice of Burgundy, countess of Auxerre, married John of Châlons (d. 1309), and several counts of Auxerre belonging to the house of Châlons distinguished themselves in the wars against the English during the 14th century. John II., count of Auxerre, was killed at the battle of Crécy (1346), and his grandson, John IV., sold his countship to King Charles V. in 1370.

AUXILIARY (from Latin auxilium, help), a term which gives aid or support; the term is used in grammar of a verb which completes the tense, mood or voice of another verb; in engineering, e.g. of the low steam power used to supplement the sailpower in sailing ships, still occasionally used in yachts, sealers or whalers; and in military use, of foreign or allied troops, more properly of any troops not permanently maintained under arms. In the British army the term "Auxiliary Forces" was employed formerly to include the Militia, the Imperial Yeomanry and the Volunteers.

AUXIMON (mod. Isiso), an ancient town in Picenum, situated on an isolated hill 8 m. from the Adriatic, on the road from Ancona to Nuceria. It was selected by the Romans as a fortress to protect their settlements in northern Picenum, and strongly fortified in 174 B.C. The walls erected at that period, of large rectangular blocks of stone, still exist in great part. Auximim became a colony at latest in 157 B.C. It often appears in the history of the civil wars, owing to its strong position. Pompey was its patron, and intended that Caesar should find resistance here in 49 B.C. It appears to have been a place of some importance in imperial times, as inscriptions and the monuments of its forum (the present piazza) show. In the 6th century it is called by Procopius the chief town of Picenum, Ancona being spoken of as its harbour.

(T. As.)

AUXONNE, a town of eastern France, in the department of Côte d'Or, 19 m. E.S.E. of Dijon on the Paris-Lyon railway to Belfort. Pop. (1906) 2766 (town); 6307 (commune). Auxonne is a quiet town situated in a wide plain on the left bank of the Saône. It preserves remains of ramparts, a stronghold of the 16th century flanked by cylindrical towers, and a sculptured gateway of the 15th century. Vauban restored these works in the latter half of the 17th century, and built the arsenal now used as a market. The church of Notre-Dame dates from the 15th century, ornamenting its triple porch only that to the south is finished. A lofty spire rises above a third tower over the crossing. The hôtel de ville (15th century) and some houses of the Renaissance period are also of architectural interest. A statue of Napoleon I. as a sub-lieutenant commemorates his sojourns in the town from 1788 to 1791. Auxonne has a tribunal of commerce and a communal college. Its industries are unimportant, but it has a large trade in the vegetables produced by the numerous market gardens in the vicinity.

AUXONNE, the name of which is derived from its position on the Saône (ad Sonam), was in the middle ages chief place of a countship, which in the first half of the 13th century passed to the dukes of Burgundy. The town received a charter in 1229 and derived some importance from the mint which the dukes of Burgundy founded in it. It was invested by the allies in 1814, and surrendered to an Austrian force in the following year.

AVAJ, the ancient capital of the Burman empire, now a subdivision of the Sagaing district in the Sagaing division of Upper Burma. It is situated on the Irrawaddy on the opposite
bank to Sagaing, with which it was amalgamated in 1859. Amarapura, another ancient capital, lies 5 m. to the north-east of Ava, and Mandalay, the present capital, 6 m. to the north. The classical name of Ava is Yadanaapura, "the city of precious gems." It was founded by Thadomī Patā in A.D. 1364 as successor to Pagān, and the religious buildings of Pagān were to a certain extent reproduced here, although on nothing like the same scale as regards either size or splendour. It remained the seat of government for about four centuries with a succession of thirty kings. In 1782 a new capital, Amarapura, was founded by Bodaw Patā, but was deserted again in favour of Ava by King Baggydaw in 1823. On his deposition by King Tharawaddi in 1837, the capital reverted to Amarapura; but finally in 1860 the last capital of Mandalay was occupied by King Mindon. For picturesque beauty Ava is unequalled in Burma, but it is now more like a park than the site of an old capital. Traces of the great council chamber and various portions of the royal palace are still visible, but otherwise the secular buildings are completely destroyed; and most of the religious edifices are also dilapidated.

AVADANA, the name given to a type of Buddhist romance literature represented by a large number of Sanskrit (Pali and Pahari) manuscripts, of which the chief are the Avadānasākta (Century of Legends), and the Dīvyāvadāna (The Heavenly Legend). Though of later date than most of the canonical Buddhist books, they are held in veneration by the orthodox, and occupy much the same position with regard to Buddhism that the Purāṇas do towards Brahmanism.

AVABI, the native name of a Malagasy lemur (Avahis laniger) nearly allied to the indri (q.v.), and the smallest representative of the subfamily Indrissinae, characterized by its woolly coat, and measuring about 28 in. in length, of which rather more than half is accounted for by the tail. Unlike the other members of the group, the avahi is nocturnal, and does not associate in small troops, but is met with either alone or in pairs. Very slow in its movements, it rarely descends to the ground, but, when it does, walks upright like the other members of the group. It is found throughout the forests which clothe the mountains on the east coast of Madagascar, and also in a limited district on the north-west coast, the specimens from the latter locality being of smaller size and rather different in colour. The eastern phase is generally rusty red above, with the inner sides of the limbs white; while the predominant hue in the western form is usually yellowish brown. (See Primates.)

AVALLONE (adapted from a French dialectic form, avance, descent), a mass of snow and ice mingled with earth and stones, which rushes down a mountain side, carrying everything before it, and producing a strong wind which uproots trees on each side of its course. Where the supply of snow exceeds the loss by evaporation the surplus descends the mountain sides, slowly in the form of glaciers, or suddenly in ice-falls or in avalanches. A mass of snow may accumulate upon a steep slope and become compacted into ice by pressure, or remain loosely aggregated. When the foundation gives way, owing to the looseness of effect of spring rains or from any other cause, the whole mass slides downward. A very small cause will sometimes set a mass of overloaded snow in motion. Thunder or even a loud shout is said to produce this effect when the mass is just poised, and Swiss guides often enjoin absolute silence when crossing dangerous spots.

AVALON, a town of central France, capital of an arrondissement in the department of Yonne, 34 m. S.E. of Auxerre on a branch of the Paris-Lyon railway. Pop. (1906) 5197. The town, with wide streets and picturesque promenades, is finnely situated on a promontory, the base of which is washed on the south by the Cousin, on the east and west by small streams. Its chief building, the church of St Lazare, dates from the 12th century. The two western portals are adorned with sculpture in the ornate Romanesque style; the tower on the left of the façade was rebuilt in the 17th century. The Tour de l'Horloge, pierced by a gateway through which passes the Grande Rue, is a 17th century structure containing a museum on its second floor. Remains of the ancient fortifications, including seven of the flanking towers, are still to be seen. Avalon has a statue of Vauban, the military engineer. The public institutions include the subprefecture, a tribunal of first instance, and a communal college. The manufacture of biscuits and gingerbread, and of leather and farm implements is carried on, and there is considerable traffic in wood, wine, and the live-stock and agricultural produce of the surrounding country.

Avalon (Aballo) was in the middle ages the seat of a viscountcy dependent on the duchy of Burgundy, and on the death of Charles the Bold passed under the royal authority.

AVALON (also written AVALLON, AVOLION, AVLION and AVELION), in Welsh mythology the kingdom of the dead, afterwards an earthly paradise in the western seas, and finally, in the Arthurian romances, the abode of heroes to which King Arthur was conveyed after his last battle. In Welsh the name is Ynys yr Afallon, usually interpreted "Isle of Apples," but possibly connected with the Celtic tradition of a king over the dead named Avalloc (in Welsh Affallach). If the traditional derivation is correct, the name is derived from the Welsh of alaf, an apple, and, as no other large fruit was well known to the races of northern Europe, is probably intended to symbolize the feasting and enjoyments of elysium. Other forms of the name are Ynysvitrin and Ynysgrutin, "Isle of Glass," which appear to be identical with Glasberg, the Teutonic kingdom of the dead. Perhaps owing to a confusion between Glasberg or Ynysvitrin and the Anglo-Saxon Glacier-burh, Glastonbury, the name "Isle of Avalon" was given to the low ridge in central Somersetshire which culminates in Glastonbury Tor, while Glastonbury itself came to be called Avalon. Attempts have also been made to identify Avalon with other places in England and Wales.

See Studies in the Arthurian Legend, by J. Rhys (Oxford, 1891); also Arthur (King); ATLANTIS.

AVARY, a French territorial title belonging to a family some of whose members have been conspicuous in history. The Béarnaise family named Bézide moved into the province of Orléans in the 17th century, and there acquired the estate of Avaray. In 1667 Théophile de Bézide, marquis d'Avaray, obtained the office of grand bailiff of Orleans, which was held by several of his descendants after him. Claude Antoine de Bézide, marquis d'Avaray, was deputy for the bailiffage of Orleans in the French-General of 1789, and proposed a Declaration of the Duties of Man as a pendant to the Declaration of the Rights of Man; he subsequently became a lieutenant-general in 1814, a peer of France in 1815, and duc d'Avaray in 1818. Antoine Louis François, comte d'Avaray, son of the above, distinguished himself during the Revolution by his devotion to the comte de Provence, afterwards Louis XVIII, whose emigration he assisted. Having nominally become king in 1799, that prince created the estate of Ilé-Jourdain a duchy, under the title of Avaray, in favour of the comte d'Avaray, whom he termed his "liberator." (M.' P.)

AVAROS, or AVARI, an East Caucasian people, the most renowned of the Lesbian tribes, inhabiting central Daghestan (see LESBIANS). They are the only Lesbian tribe who possess a written language, for which they make use of the Arabic characters. They are often confused with the Avars whose empire on the Danube was broken by Charlemagne; but Komarov asserts that they are of more recent origin as a tribe, their name being Lowland Turki for "vagrant" or "refugee."

AVATAR, a Sanskrit word meaning "descent," specially used in Hindu mythology (and so in English) to express the incarnation of a deity visiting the earth for any purpose. The ten Avatars of Vishnu are the most famous. The Hindus believe he has appeared (1) as a fish, (2) as a tortoise, (3) as a hog, (4) as a monster, half man half lion, to destroy the giant Iranian, (5) as a dwarf, (6) as Rāma, (7) again as Rāma for the purpose of killing the thousand-armed giant Cartasuciagarunā, (8) as Krishna, (9) as Buddha. They allege that the tenth Avatar has yet to occur and will be in the form of a white-winged horse (Kalki) who will destroy the earth.

AVEBURY, JOHN LUBBOCK, 1ST BARON (1834- ), English banker, politician and naturalist, was born in London
on the 30th of April 1834, the son of Sir John William Lubbock, 3rd baronet, himself a highly distinguished man of science. John Lubbock was sent to Eton in 1845; but three years later was taken into his father’s bank, and became a partner at twenty-two. In 1865 he succeeded to the baronetcy; his love of science kept pace with his increasing participation in public affairs. He served on commissions upon coinage and other financial questions; and at the same time acted as president of the Entomological Society and of the Anthropological Institute. Early in his career several banking reforms of great importance were due to his initiative, while such works as Prehistoric Times (1865) and The Origin of Civilization (1870) were proceeding from his pen. In 1870, and again in 1874, he was elected a member of parliament for Maidstone. He lost the seat at the election of 1880; but was at once elected member for London University, of which he had been vice-chancellor since 1872. He carried numerous enactments in parliament, including the Bank Holidays Act 1871, and bills dealing with absorbing debtors, shop hours regulations, public libraries, open spaces, and the preservation of ancient monuments, and he proved himself an influential member of the University. A prominent supporter of the Statistical Society, he took an active part in criticizing the encroachment of municipal trading and the increase of the municipal debt. He was elected the first president of the Institute of Bankers in 1879; in 1881 he was president of the British Association, and from 1881 to 1886 president of the Linnæan Society. He received honorary degrees from the universities of Oxford, Cambridge (where he was Rede lecturer in 1886), Edinburgh, Dublin and Würzburg; and in 1878 was appointed a trustee of the British Museum. From 1888 to 1892 he was president of the London Chamber of Commerce; from 1889 to 1890 vice-chairman and from 1890 to 1892 chairman of the London County Council. During the same period he served on royal commissions on education and on gold and silver. In 1890 he was appointed a privy councillor; and was chairman of the committee of design on the new coinage in Great Britain in 1902, as well as the supercargo, under the title of Baron Avebury, and he continued to play a leading part in public life, not only by the weight of his authority on many subjects, but by the readiness with which he lent his support to movements for the public benefit. Among other matters he was a prominent advocate of proportional representation. As an original author and a thoughtful popularizer of natural history and philosophy he had few rivals in his day, as is evidenced by the number of editions issued of many of his writings, among which the most widely read have been: The Origin and Metamorphoses of Insects (1837), British Wild Flowers (1857), Ants, Bees and Wasps (1858), Flowers, Fruits and Leaves (1886), The Pleasures of Life (1887), The Senses, Instincts and Intelligence of Animals (1888), The Beauties of Nature (1892), The Use of Life (1894).

AVEBURY, a village in the Devizes parliamentary division of Wiltshire, England, on the Kennet, 8 m. by road from Marlborough. The fine church of St. James contains an early font with Norman carving, a rich Norman doorway, a painted reredos, and a beautiful old roadstone in good preservation. Avebury House is Elizabethan, with a curious stone dovecot. The village has encroached upon the remains of a huge stone circle (not quite circular), surrounded by a ditch and rampart of earth, and once approached by two avenues of monoliths. Within the larger circle were two smaller ones, placed not in the axis of the great one but on its north-eastern side, each of which consisted of a double concentric ring of stones; the centre being in one case a menhir or pillar, in the other a dolmen or tablestone resting on two uprights. Few traces remain, as the monoliths have been largely broken up for building purposes. The circle is the largest specimen of primitive stone monuments in Britain, measuring on the average 130 ft. in diameter. The stones are all the native Sarsens which occur everywhere in the district, and show no evidence of having been hewn. Those still remaining vary in size from 5 to 10 ft. in height above ground, and from 3 to 12 ft. in breadth. As in the case of Stonehenge, the purpose for which the Avebury monument was erected has been the source of much difference of opinion among antiquaries, Dr. Stukely (Stonehenge a Temple restored to the British Druids, 1740) regarding it as a Druidical temple, while Ferguson (Remains of Prehistoric Monuments, 1872) believed that it was a summit of the Stonehenge. Avebury Hill, marks the site of the graves of those who fell in the last Arthurian battle at Badon Hill (A.D. 520). The majority of antiquaries, however, see no reason for dissociating its chronological horizon from that of the numerous other analogous monuments found in Great Britain, many of which have been shown to be burial places of the Bronze Age. Excavations were carried out here in 1908, but without throwing any important light on the monument.

There are many barrows on the neighbouring downs, besides traces of a double oval of monoliths on Hackpen hill, and the huge mound of Silbury Hill. Waden Hill, to the south, has been, like Badbury, identified with Badon Hill, which was the traditional scene of the twelfth and last great battle of King Arthur in 520. The Roman road from Winchester to Bath skirts the south side of Silbury Hill.

In the Doomsday Survey, the church of Avebury (Aveberie, Abury), with two hides attached, was held in chief by Rainbold, a priest, and was bestowed by Henry III. on the abbots and monks of Cirencester, who continued to hold it until the reign of Henry VIII. The manor of Avebury was granted in the reign of Henry I. to the Benedictine monks of St George of Boucherville in Normandy, and a cell from that abbey was subsequently established here. In consequence of the war with France in the reign of Edward III., this manor was annexed by the crown, and was conferred on the newly founded college of New College, Oxford, together with all the possessions, spiritual and temporal, of the priory.

AVEIA, an ancient town of the Vestini, on the Via Claudia Nova, 6 m. S.E. of Aquila, N.E. of the modern village of Fossa. Some remains of ancient buildings still exist, and the name Aveia still clings to the place. The identification was first made by M. G. Carnesani in Della città di Aveia ed i vestini (Rome, 1773). Paintings in the church of S. Maria ad Cryptas, of the 12th to 15th centuries, are important in the history of art. An inscription of a stationarius of the 3rd century, sent here on special duty (no doubt for the suppression of brigandage), was found here in 1903 (A. von Domaszewski, Röm. Mitte., 1902, 330).

AVEIRO, a seaport, episcopal see, and the capital of an administrative district, formerly included in the province of Beira, Portugal; on the river Vouga, and the Lisbon-Oporto railway. Pop. (1900) 9079. Aveiro is built on the southern shore of a marshy lagoon, containing many small islands, and measuring about 15 m. from north to south, with an average breadth of about 1 m. The Barra Nova, an artificial canal about 33 ft. deep, was constructed between 1801 and 1808, and gives access to the Atlantic ocean. The local industries include the preparation of sea-salt, the catching and curing of fish, especially sardines and oysters, and the gathering of aquatic plants (zucchi). There is also a brisk trade in wine, oil and fruit; while the Aveiro district contains copper and coal mines, besides much good pasture-land.

Aveiro is probably the Roman Talabriga. In the 16th century it was the birthplace of João Afonso, one of the first navigators to visit the fishing-grounds of Newfoundland; and it soon became famous for its fleet of more than sixty vessels, which sailed yearly to that country, and returned laden with dried cod-fish. During the same century the cathedral was built, and the city was made a duchy. The title of "duke of Aveiro" became extinct when its last holder, Dom José Mascarenhas e Lancaster, was burned alive for high treason, in 1759. The administrative district of Aveiro coincides with the north-western part of the province of Beira; pop. (1900) 50,316; area, 1065 sq. m.

AVELLA (anc. Abella), a city of Campania, Italy, in the province of Avellino, 23 m. N.E. of Naples by rail. Pop. (1900) 4109. It is finely situated in fertile territory and its nuts (nuces Avellanae) and fruit were renowned in Roman days. About 2 m. to the north-east lies Avella Vecchia, the ancient Abella, regarded
by the ancients as a Chaldaic colony. An important Oscan inscription relates to a treaty with Nola, regarding a joint temple of Hercules, attributable to the 2nd century B.C. Under the early empire it had already become a colony and had perhaps been one since the time of Sulla. It was one of the nodes of the circuit and of an amphitheatre, and lay on the road from the city of Nola to Abellinum, which was here perhaps joined by a branch from Suessula.

See J. Beloch, Campanien (2nd ed., Breslau, 1890). 411 seq.

AVELLINO, a city and episcopal see of Campania, Italy, the capital of the province of Avellino, 1,150 ft. above sea-level, 28 m. direct and 59 m. by rail E.N.E. of Naples, at the foot of Monte Vergine. Pop. (1901) 23,760. There are ruins of the castle constructed in the 9th or 10th century, in which the antipope Anastaius II. crowned Count Roger II. king of Sicily and Apulia. Avellino is the junction of lines to Benevento and Rocchetta S. Antonio. The name is derived from the ancient Abellinum, the ruins of which lie 2½ m. north-east, close to the village of Atripalda, and consist of remains of city walls and an amphitheatre in opus reticulatum, i.e. of the early imperial period, when Abellinum appears to have been the chief place of a tribe, to which belonged also the independent communities of the Abellinates cognomine Protopoli among the Hirpini, and the Abellinates cognomini Marsi among the Apulians (Nissen, Italiane Landeskunde, II 582). It lay on the boundary of Campania and Nola. It was the temporary residence of the popes, and is named in the Gospel of Luke (10:36) as the place to which Jesus came on his way to the house of Simon and Andrew, the sons of Simon. From it Jesus felt the sympathy of the daughter, the other disciples being come with anвестiя of money to pay for the right to enter the house. But even in that orthodox age he became a siæve to the amir of Murcia. Afterwards he went to Valencia, then to Saragossa. After the fall of Saragossa (1119) he went to Seville, then to Xativa, where he is said to have returned to Islam to save his life. Finally he retired to the Almoravid court at Fez, where he was poisoned in 1138. Ibn 'Usaibi 'a gives a list of twenty-five of his works, but few of these remain. He had a distinct influence upon Averoese (see ARABIAN PHILOSOPHY).

AVENARIUS, RICHARD HEINRICH LUDWIG (1843-1896). German philosopher, was born in Paris on the 10th of November 1843. His education, begun in Zürich and Berlin, was completed at the university of Leipzig, where he graduated in 1876. In 1877 he became professor of philosophy in Zürich, where he died on the 18th of August 1896. At Leipzig he was one of the founders of the Akademisch-philosophische Verein, and was the first editor of the Vierteljahrschrift für wissenschaftliche Philosophie. In 1868 he published an essay on the Pantheism of Spinoza. His chief works are Philosophie als Denken der Welt gemäß dem Princip des kleinsten Kraftmasses (1876) and the Kritik der reinen Erfahrung (1888-1890). In these works he made an attempt to co-ordinate thought and action. Like Mach, he started from the principle of economy of thinking, and in the Kritik endeavored to explain pure experience in relation to knowledge and environment. He discovers that statements dependent upon environment constitute pure experience. This philosophy, called Empirio-criticism, is not, however, a realistic but an idealistic dualism, nor can it be called materialism.

AVENGERS, or Vendicatoi, a secret society formed about 1186 in Sicily to avenge popular wrongs. The society was finally suppressed by King William II., the Norman, who hanged the grand master and branded the members with hot irons.

AVENTIAL, or Avantaille (O. Fr. evantail, presumably from a Latin word exventaculum, air-hole), the mouthpiece of an old-fashioned helmet, movable to admit the air.

AVENTINUS (1477-1534), the name taken by Johann Turmaer, author of the Annales Boruitum, or Annals of Bavaria, from Avventino, the Latin name of the town of Abensberg, where he was born, in August 1477. Having studied at Ingolstadt, Vienna, Cracow and Paris, he returned to Ingolstadt in 1527, and in 1529 was appointed tutor to Louis and Ernest, the two younger sons of Albert the Wise, the late duke of Bavaria-Munich. He retained this position until 1542, wrote a Latin grammar, and other manuals for the use of his pupils, and in 1545 travelled in Italy with Ernest. Encouraged by William IV., duke of Bavaria, he began to write the Annales Boruitum, about 1517, and finishing this book in 1531, undertook a German version of it, entitled Bayerische Chronik, which he completed some years later. He assisted to found the Süditalia literaria Angiolostadensis, under the auspices of which several old manuscripts were brought to light. Although Aventinus did not definitely adopt the reformed faith, he sympathized with the reformers and their teaching, and showed a strong dislike for the monks. On this account he was imprisoned in 1528, but his friends soon effected his release. The remainder of his life was somewhat unsettled, and he died at Regensburg on the 9th of January 1534. The Annales, which are in seven books, deal with the history of Bavaria in conjunction with general history from the earliest times to 1492 and the author shows a strong sympathy for the reformers. After the death of his patron Farnsworth, he took immense pains with his work, and to some degree anticipated the modern scientific method of writing history. The Annales were first published in 1554, but many important passages were omitted in this edition, as they reflected on the Roman Catholics. A more complete edition was published at Basel in 1586 by Nicholas Cisner, Aventinus, who has been called the "Bavarian Herodotus," wrote other books of minor importance, and a complete edition of his works was published at Munich (1881-1886). More recently a new edition (six vols.) has appeared.

See T. Wiedemann, Johann Turmaur gen. Aventinus (Freising, 1885); W. Dittmar, Aventinus (Nordlingen, 1862); J. von Döllinger, Aventinus und seine Zeit (Munich, 1877); S. Rieger, Zum Schicksal der neuen Edition von Aventinus (Münchener, 1886); F. X. von Wegele, Aventinus (Bamberg, 1890).
AVENTURINE, or AVANTURINE, a variety of quartz containing spangles of mica or scales of iron-oxide, which confer brilliance on the stone. It is found chiefly in the Ural Mountains, and is cut for ornamental purposes at Ekaterinburg. Some of the Siberian aventurine, like that of the vase given by Nicholas I. to Sir R. Murchison, in 1843, is a micaceous iron-stained quartz, of but little beauty. Most aventurine is of reddish brown or yellow colour, but a green variety, containing scales of fuchsite or chrome-mica, is also known. This green aventurine, highly valued by the Chinese, is said to occur in the Bellary district in India.

Aventurine felspar, known also as Sun-stone (g.z) is found principally at Tvedestrand in south Norway, and is a variety of oligoclase enclosing micaceous scales of haematite. Other kinds of felspar, even orthoclase, may however also show the aventurine appearance. Both plagioclase and orthoclase aventurine occur at several localities in the United States.

The mineral aventurine takes its name from the well-known aventurine-glass of Venice. This is a reddish brown glass with gold-like spangles, more brilliant than most of the natural stone. The story runs that this kind of glass was originally made accidentally at Murano by a workman, who let some copper filings fall into the furnaces "containing" when the glass was melted, aventurine glass. From the Murano glass, the name passed to the mineral, which displayed a rather similar appearance.

AVENUE (the past participle feminine of Fr. avenir, to come to), a way of approach; more particularly, the chief entrance-road to a country house, with rows of trees on each side; the trees themselves are said to form the avenue. In modern times the word has been much used as a name for streets in towns, whether with or without trees, such as Fifth Avenue in New York, or Shaftesbury Avenue in London.

AVENZOAR, or ABUMERON [Abū Merwān 'Abdal-Malik ibn Zuhr], Arabian physician, who flourished at the beginning of the 12th century, was born at Seville, where he exercised his profession with great reputation. His ancestors had been celebrated as physicians for several generations, and his son was afterwards held by the Abanis to be even more eminent in his profession than Avenzoor himself. He was a contemporary of Averroes, who, according to Leo Africanus, heard his lectures, and learned physic of him. He belonged, in many respects, to the Dogmatists or Rational School, rather than to the Empirics. He was a great admirer of Galen; and in his writings he protests emphatically against quackery and the superstitions of the astrologers. He shows no inconsiderable knowledge of anatomy in his remarkable description of inflammation and abscess of the mediastinum in his own person, and its diagnosis from common pleuritis as well as from as abscess and dropsey of the pericardium. In cases of obstruction or of palisy of the gullet, his three modes of treatment are ingenious. He proposes to support the strength by placing the patient in a tepid bath of nutritious liquors, that might enter by cutaneous imbition, but does not recommend this. He speaks more favourably of the introduction of food into the stomach by a silver tube; and he strongly recommends the use of nutritive enemata. From his writings would appear that the offices of physician, surgeon and apothecary were already considered as distinct professions.

He wrote a book entitled The Method of Preparing Medicines and Diet, which was translated into Hebrew in the year 1280, and thence into Latin by Paravicino, whose version, first printed at Venice, 1490, has passed through several editions.

AVERAGE, a term found in two main senses. (1) The first, which occurs in old law, is from a Law-Latin avaridum, and is connected with the Domestacy Book avera, the "day's work which the king's tenants gave to the sheriff"; it is supposed to be a form of the O. Fr. auvre (avare), work, affected by aver, the O. Eng. word for cattle or property, but the etymology is uncertain. As meaning some form of feudal service rendered by tenants to their superiors, it survived for a long time in the Scottish phrase "arriage and carriage," this form of the word being due to a contraction into "arage." (2) The second word, which represents the modern usages, is also uncertain in its derivation, but corresponded with the Fr. avérie, and was early spelt "averies," recurring also as "avaria," "avaria," and was a certain tax on goods, and then more precisely in maritime law any charge additional to "freight" (see AFFREIGHTMENT), payable by the owner of goods sent by ship. Hence the modern employment of the term for particular and general average (see below) in marine insurance. The essential of equitable distribution, involved in this sense, was transferred to give the word "average" its more colloquial meaning of an equalization of amount, or medium among various quantities, or nearest common rate or figure. (For a discussion of the etymology, see the New English Dictionary, especially the concluding note with reference to authorities.)

In Shipping.—Average, in modern law, is the term used in maritime commerce to signify damages or expenses resulting from the accidents of navigation. Average is either general or particular. General average arises when sacrifices have been made, or expenditures incurred, for the preservation of the ship, cargo and freight, from some peril of the sea or from its effects. It implies a subsequent contribution, from all the parties concerned, rateably to the values of their respective interests, to make good the loss thus occasioned. Particular average signifies the damage or partial loss happening to the ship, goods, or freight by some fortuitous or unavoidable accident. It is borne by the parties to whose property the misfortune happens or by their insurers. The term average originally meant what is now distinguished as general average; and the expression "particular average," although not strictly accurate, came to be afterwards used for the convenience of distinguishing those damages or partial losses for which no general contribution could be claimed.

Although nothing can be more simple than the fundamental principle of general average, that a loss incurred for the advantage of all the coadventurers should be made good by them all in equitable proportion to their stakes in the adventure, the application of this principle to the varied and complicated cases which occur in the course of maritime commerce has given rise to many diversities of usage at different periods and in different countries. It is soon discovered that the principle cannot be applied in any settled or consistent manner unless by the aid of rules of a technical and sometimes of a seemingly arbitrary character. The difficulty, which at one time seemed nearly insuperable, of bringing together the rules in force in the several maritime countries, has been to a large extent overcome—not by legislation but by framing a set of rules covering the principal points of difference in such a manner as to satisfy, on the whole, those who are practically concerned, and to lead them to adopt these rules in their contracts of affreightment and contracts of insurance (see INSURANCE: Marine). The honour of the achievement belongs to a small number of men who recognized the need of uniformity. The work began in May 1860 at a congress held at Glasgow, under the presidency of Lord Brougham, assisted by Lord Neaves. Further congresses were held in London (1862), and at York (1864), when a body of rules known as the "York Rules" was agreed. There the matter stood, until it was taken up by the "Association for the Reform and Codification of the Law of Nations" at conferences held at the Hague (1875), Bremen (1876) and Antwerp (1877). Some changes were made in the "York Rules"; and so altered, the body of rules was adopted at the last-named conference, and was styled the "York and Antwerp (or York-Antwerp) Rules." The value of these rules was quickly perceived, and practical use of them followed. But they proved to be insufficient, or unsatisfactory, on some points; and again, in the autumn of 1860, a conference on the subject was held, this time at Liverpool, by the same Association, under the able presidency of Dr F. Sieveking, president of the Hanseatic High Court of Appeal at Hamburg. Important changes were then made, carrying further certain departures from English law, already apparent in the earlier rules, in favour of views prevailing upon the continent of Europe and in the United States. The new rules were styled the York-
Antwerp Rules 1890. In practice they quickly displaced those of 1877; and in 1892, at a conference of the same Association held at Genoa, it was formally decided that the only international rules of general application, having the sanction and authority of the association were the York-Antwerp Rules as revised in 1890, and that the original rules were rescinded. It is this later body of rules which is now known as the York-Antwerp Rules. Reference is now to be found in most English contracts of carriage and contracts of insurance, to these rules, as intended to govern the adjustment of G.A. between the parties; with the result that (so far as the rules cover the ground) adjustments do not depend upon the law of the place of destination, and so do not vary according to the destination, or the place at which the voyage may happen to be broken up, as used formerly to be the case.

The rules are as follows:—

RULE I.—JE T TISON OF DECK CARGO

No jettison of deck cargo shall be made good as G.A. Every structure not built in with the frame of the vessel shall be considered to be a part of the deck of the vessel.

RULE II.—DAMAGE BY JETTISON AND SACRIFICE FOR THE COMMON SAFETY

Damage done to a ship and cargo, or either of them, by fire or in consequence of a sacrifice made for the common safety, and by water which goes down a ship's hatches opened, or other opening made for the purpose of making a jettison for the common safety, shall be made good as G.A.

RULE III.—EXTINGUISHING FIRE ON SHIPBOARD

Damage done to a ship and cargo, or either of them, by water or otherwise, including damage by beaching or scuttling a burning ship, in extinguishing a fire on board the ship, shall be made good as G.A.; except that no compensation shall be made for damage to such portions of the ship and bulk cargo, or to such separate packages of cargo, as have been on fire.

RULE IV.—CUTTING AWAY WRECK

Loss or damage caused by cutting away the wreck or remains of wrecks, or of other things which have previously been carried away by sea-peril, shall not be made good as G.A.

RULE V.—VOLUNTARY STRANDING

When a ship is intentionally run on shore, and the circumstances are such that if that course were not adopted she would inevitably sink, or drive on shore or on rocks, no loss or damage caused to the ship, cargo and freight, or any of them, by such intentional running on shore, shall be made good as G.A. But in all other cases where a ship is intentionally run on shore for the common safety, the consequent loss or damage shall be allowed as G.A.

RULE VI.—CARRYING PESS OF SAIL—DAMAGE TO OR LOSS OF SAILS

Damage to or loss of sails and spars, or either of them, caused by force of wind on the ground or on any part of the ship, shall be made good as G.A.; but where a ship is aloft, no loss or damage caused to the ship, cargo and freight, or any of them, by carrying a press of sail, shall be made good as G.A.

RULE VII.—DAMAGE TO ENGINES IN REPLACING A SHIP

Damage caused to machinery and boilers of a ship which is a shore and in a position of peril, in endeavouring to refloat, shall be allowed in G.A., when shown to have arisen from an actual intention to float the ship for the common safety at the risk of such damage.

RULE VIII.—EXPENSES OF LIGHTENING A SHIP WHEN ASHORE, AND CONSEQUENT DAMAGE

When a ship is ashore, and, in order to float her, cargo, bunker, coals and ship's stores, or any of them, are discharged, the extra cost of lightening, lighter hire, and redrying (if incurred), and the loss or damage sustained therefrom, shall be allowed as G.A.

RULE IX.—CARGO, SHIP'S MATERIALS, AND STORES BURNT FOR FUEL

Cargo, ship's materials and stores, or any of them, necessarily burnt for fuel for the common safety at a time of peril, shall be admitted as G.A., when and only when an ample supply of fuel had been provided; but the estimated quantity of coal that would have been consumed, calculated at the price current at the ship's last port of departure at the date of her leaving, shall be charged to the shipowner and credited to the G.A.

RULE X.—EXPENSES AT PORT OF REFUGE, &c.

(a) When a ship shall have entered a port or place of refuge, or shall have returned to her port or place of loading, in consequence of accident, sacrifice, or other extraordinary circumstances, which render that necessary for the common safety, the expenses of entering such port or place shall be admitted as G.A.; and when she shall have sailed thence with her original cargo, or a part of it, the corresponding expenses of leaving such port or place, consequent upon such entry or return, shall likewise be admitted as G.A.

(b) The cost of discharging cargo from a ship, whether at a port or place of refuge, or at any port or place, and whatsoever sacrifice, when the discharge was necessary for the common safety or to enable damage to the ship, caused by sacrifice or accident during the voyage, to be repaired, if the repairs were necessary for the safe prosecution of the voyage.

(c) Whenever the cost of discharging cargo from a ship is admissible as G.A., the cost of reloading and storing such cargo on board the said ship, together with all storage charges on such cargo, shall likewise be so made good. But when the ship is condemned or does not proceed on her original voyage, no storage expenses incurred after the date of the ship's condemnation or of the abandonment of the voyage shall be admitted as G.A.

RULE XI.—WAGES AND MAINTENANCE OF CREW IN PORT OF SAFETY

When a ship shall have entered or shall have been detained in any port or place under the circumstances, or for the purposes of the repairs, mentioned in Rule X., the wages payable to the master, officers and crew, together with the cost of maintenance of the same, during the period of detention in such port or place until the ship shall or should have been made ready to proceed upon her voyage, shall be admitted as G.A. But when this ship is condemned or does not proceed on her original voyage, the wages and maintenance of the master, officers and crew, incurred after the date of the ship's condemnation or of the abandonment of the voyage, shall not be admitted as G.A.

RULE XII.—DAMAGE TO CARGO IN DISCHARGING, &c.

Damage done to or loss of cargo necessarily caused in the act of discharging, storing, reloading and stowing shall be made good as G.A.; but only when the cost of those measures respectively is admitted as G.A.

RULE XIII.—DEDUCTIONS FROM COST OF REPAIRS

In adjusting claims for G.A., repairs to be allowed in G.A. when and only when the cost of those measures respectively is admitted as G.A.

In the case of iron or steel ships, from date of original register to the date of accident:

<table>
<thead>
<tr>
<th>Up to 1 year old (A.)</th>
<th>All repairs to be allowed in full, except painting or coating of bottom, from which one-third is to be deducted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Between 1 and 3 years (B.)</td>
<td>One-third to be deducted off repairs to and removal of ironware, heads of hull, masts and spars, furniture, upholstery, crockery, metal and glass, also sails, rigging, ropes, sheets, and hawser (other than wire and chain), awnings, covers, and painting.</td>
</tr>
<tr>
<td>Between 3 and 6 years (C.)</td>
<td>One-sixth to be deducted off wire rigging, wire ropes, wire halyards, and chains, donkey engines, steam winches and connections, steam cranes and connections; other repairs in full.</td>
</tr>
<tr>
<td>Between 6 and voyages (D.)</td>
<td>Deductions as above under clause B, except that one-sixth be deducted off ironwork of masts and spars, and machinery (inclusive of boilers and their mountings).</td>
</tr>
<tr>
<td>Between 10 &amp; 15 years (E.)</td>
<td>Deductions as above under clause C, except that one-third be deducted off ironwork of masts and spars, and any and all metal and iron machinery (inclusive of boilers and their mountings), and all hawser, ropes, sheets, and rigging.</td>
</tr>
</tbody>
</table>

In the case of general, when and only when the cost of those measures respectively is admitted as G.A., the expenses of repairing the ship and her cargo, machinery, and stores, and from which one-sixth is to be deducted.

| Over 15 years (F.) | One-third to be deducted off all repairs and renewals, except ironwork of hull and cementing and chain which from which one-sixth is to be deducted. |

Anchors to be allowed in full. One-sixth to be deducted off chain cables.

The deductions (except as to provisions and stores, mast and spars (and bed)) to be respectively doubled if the ship or the cargo, machinery, and stores shall be kept for the purpose of being repaired or for sale in the port of the ship, and not the age of the particular part of her to which they apply. No painting bottom to be allowed if the bottom has not been painted within six months previous to the date of accident. No deduction to be made in respect of old material which is repaired without being replaced by new, and provision and stores which have not been in use.
In the case of wooden or composite ships:—
When a ship is under one year old from date of original register, at the time of accident, no deduction "new for old" shall be made. After that period a deduction of one-third shall be made, with the following exceptions:

- Anchors shall be allowed in full. Chain cables shall be subject to a deduction of one-sixth only.
- No deduction shall be made in respect of provisions and stores which has not been in use.
- Metal sheathing shall be dealt with, by allowing in full the cost of a weight equal to the gross weight of metal sheathing stripped off, minus the proceeds of the old metal. Nails, felt and labour metalling are subject to a deduction of one-third.

In the case of ships generally:
- In the case of all ships, the expense of straightening bent iron work, including labour of taking out and replacing it, shall be allowed in full.
- Graving dock dues, including expenses of removals, cartages, use of shears, stages and graving dock materials, shall be allowed in full.

**Rule XIV.—Temporary Repairs**

- No deductions "new for old" shall be made from the cost of temporary repairs of damage allowed as G.A.

**Rule XV.—Loss of Freight**

- Loss of freight arising from damage to or loss of cargo shall be made good as G.A., either when caused by a G.A. act or when the damage to or loss of cargo is so made good.

**Rule XVI.—Amount to be Made Good for Cargo Lost or Damaged**

- The amount to be made good for G.A. damage or loss of goods sacrificed shall be the loss which the owner of the goods has sustained thereby, based on the market values at the date of the arrival of the vessel or at the termination of the adventure.

**Rule XVII.—Contributory Values**

- The contribution to a G.A. shall be based on the actual values of the property at the termination of the adventure, to which shall be added the amounts of G.A. for property sacrificed; deduction being made from the shipowner's freight and passage-money at risk, of such port charges and crew's wages as would not have been incurred had the ship and cargo been totally lost at the date of the G.A. act or sacrifice, and have not been allowed as G.A. deduction being also made from the value of all cargoes incurred in respect thereof subsequently to the G.A. act, except such charges as are allowed in G.A.
- Passengers' baggage and personal effects, not shipped under bill of lading, shall not contribute to G.A.

**Rule XVIII.—Adjustment**

- Except as provided in the foregoing rules, the adjustment shall be drawn up in accordance with the law and practice that would have governed the adjustment had the contract of affreightment not contained a clause to pay G.A. according to these rules.

The above rules differ in some important respects from English common law, and from former English practice. They follow ideas upon the subject of G.A. which have prevailed in practice in foreign countries (though often in apparent opposition to the language of the codes), in preference to the more strict principle of the common law applied by English courts. That principle requires that, in order to have the character of G.A. a sacrifice or expenditure must be made for the common safety of the several interests in the adventure and under the pressure of a common risk of loss, or even necessary to enable the common adventure to be completed. G.A., on the English view, only arises where the safety of the several interests is at stake. "The idea of a common commercial adventure, as distinguished from the common safety from the sea," is not recognized. It is not sufficient "that an expenditure should have been made to benefit both cargo owner and shipowner."

Thus expenses incurred after ship and cargo are in safety, say at a port of refuge, are not generally, by English law, to be treated as G.A.; although the putting into port may have been for safety, and therefore a G.A. act. If the putting into port is not treated by a G.A. as such, by cutting away the ship's masts, the case is different; the port expenses, the expenses of repairing the G.A. damage, and the incidental expenses of unloading, storing and reloading the cargo are, in such a case, treated as consequences of the original sacrifice, and therefore subjects for contribution. But where the reason for putting in is to avoid some danger, such as a storm or hostile cruiser, or to effect repairs necessitated by some accidental damage to the ship, the G.A. sacrifice is considered to be at an end when the port has been reached, if the ship and cargo are then in physical safety. The subsequent expenditure in the port is said to be the act of the shipowner, to be paid by the G.A., or by the G.A. sacrifice, and is incurred in performance of the shipowner's obligation under his contract. The practice of English average adjusters has indeed modified this strict view by treating the expense of unloading as G.A.; but it may well be doubted whether that practice can be legally upheld.

Thus, it is in putting in to protect the cargo in the ship's hold, by blocking up and insulating the hold, or by keeping it in a cool state, that it is in protecting the cargo as in warehousing it, is by English practice treated as a charge to be borne by the cargo for whose benefit it was incurred.

But, to turn now to York-Antwerp Rule XI., it will be seen that a much broader view is adopted. Whatever the reason for putting into the port of refuge, provided it was necessary for the common safety, the expenses of going in, and the consequent expenses of getting out of it, and of securing the cargo, are allowed as G.A., Rule X. (a). Further, the cost of discharging the cargo to enable damage to the ship to be repaired, whether caused by sacrifice or by accident during the voyage, is to be allowed as G.A., if the repairs were necessary for the safe prosecution of the voyage, Rule X. (b). And that it is to be so even where such repairs are done at a port of call, as well as where done at a port of refuge. Again, when the cost of discharging is treated as G.A., so also are to be the expenses of storing the cargo on shore, and of re-landing, and of storing on board, such cargo as has been done (Rule X. (c)), together with any damage or loss incidental to those operations (Rule XII.).

Further, by Rule XI., the wages of the master, officers and crew, and the cost of their maintenance, during the detention of a ship under the circumstances, or for the purpose of the repairs mentioned in Rule X., are to be allowed in G.A. It is questionable whether English law allows the wages and maintenance of the crew at a port of call, or at the domestic port where the detention is for the purpose of incidental damage; it seems clear that they are not allowed. And in practice under common law, the allowance is never made; so that Rule XI. is an important concession to the shipowner. Like the changes introduced by Rule X., it is a change towards the practice in foreign countries.

It may be noted that the rules do not afford equal protection to a shipper in the comparatively infrequent case of his being put to expense by the delay of his ship in a port of call. He has not the extra wages and provisions of his cattle-men on board, nor the extra fodder consumed by the cattle during the stay at a repairing port, made as good as G.A., under Rules XI. and X. (Anglo-Argentine &c. Agency v. Temperley Shipping Co., [1892] Q.B. 4. 4.)

As to the acts which amount to G.A. sacrifices, as distinguished from expenditures, the York-Antwerp Rules do not much alter English common law. They do, however, make definite provision upon some subjects, such as the "conversion of goods" (general average sacrifices).
Rule VII. allows as G.A. any damage sustained by cargo when discharged and, say, lightered for the purpose of getting the ship off a strand. And the corresponding damage in the case of cargo discharged at a port of refuge to enable repairs to be done to the ship is allowed, but in the latter case the amount does not expressly extend to damage sustained while on land. Whether the law would require contribution to a loss of goods, say, by thieves or by fire, while landed for repairs, is not clear. Where the landing was undertaken as a matter of necessity, as a saving of the ship and merchandise, it would seem that the loss ought to be made good, as being a result of the special risks to which those goods have thereby been exposed. The risks which they would have run if they had remained on board throughout are taken as a basis, as we have seen, in estimating how much of the damage is to be made good.

Where cattle were taken into a port of refuge in Brazil, owing to accidental damage to the ship, with the result that they could not legally be landed at their destination (Deiprada), and had to be taken elsewhere, the Underwriter, to whom they were of much less value, this loss of value was allowed in G.A. (Anglo-Argentine &c. Agency v. Tempester Shipping Co., 1899, 2 Q.B. 403). The case of a stranded ship and cargo often gives rise to difficulty as to whether the cost of operations to lighten the ship, and afterwards to get her floated, should be treated as G.A. expenditure, or as expenses separately incurred in saving the separate interests. The true conclusion seems to be that either the whole operation should be considered property, or the expense be contributed to by all the interests saved, or else the several parts of the operation should be kept distinct, debiting the cost of each to the interests thereby saved. Which of these two views is to be adopted depends on considerations of expediency, the motives with which the earlier operations (usually the discharge of the cargo) were presumably undertaken. It may, however, happen that this test cannot be applied once and for all. Take the case of a stranded ship, say, off the coast of Brazil, and goods and cargo also some bullion. Suppose this last to be rescued and taken to a place of safety at small expense in comparison with its value. It may well be that that operation must be regarded as done in the interest of the ship itself, but that the subsequent operations of lightening the ship and floating her can only be properly regarded as undertaken in the common interest of ship, hemp, grain and freight. In such a case there will be a G.A. contribution towards the new expenses incurred for the ship, hemp, grain and bullion, and another in respect of the old expenses. It will merely bear the expense of its own rescue (Royal Mail S.P. Co. v. English Bank of Rio de Janeiro, 1887, 19 Q.B.D. 362). The York-Antwerp Rules have not only the valuable result of introducing uniformity where there had been great variety, and certainty as to the principles which will be acted upon in adjusting any G.A. loss, but also they have introduced greater clearness and definiteness on points where there had been a want of definition. Thus Rule XLI. has laid down a careful and definite rule to regulate the deductions from the cost of repairs, in respect of "new for old," in place of the former somewhat uncertain rules which varied according to the place of repair; while at the same time the operation of allowing the享受ed damages on taking the ship out of the shipbuilder's shop, for the last trade in modern conditions of shipbuilding. And Rule XVII. lays down a rule as to contributory values in place of the widely varying rules of different countries as to the amounts upon which ship and freight shall contribute (cf. Gow, Marine Insurance, 305).

It may be of interest to refer briefly to one or two main principles which govern the adjustment (q.v.) of general average, i.e. the calculation of the amounts to be made good and paid by the several interests, which is a complicated matter. The fundamental idea is that the several interests at risk shall contribute in proportion to the benefits they have severally derived by the completion of the voyage, or as nearly as possible, and not merely in proportion to the amounts at stake when the average was made, but in proportion to the results when the adventure has come to an end. An interest which has become lost after the sacrifice, during the subsequent course of the voyage, will pay nothing; an interest which has become depreciated will pay in proportion to the diminished value. The liability to contribute is inchoate only when the sacrifice has been made. It becomes complete when the adventure has come to an end, either by arrival at the destination, or by having been broken up at some intermediate point, while the interest in question still survives. To this there is one exception, in the case of G.A. expenditure. Where such expenditure has been incurred by the owner of one interest, generally by the shipowner, the repayment to him by the other interests ought not to be wholly dependent upon the subsequent safety of those interests at the ultimate destination. If those other interests or some of them arrive, or are realized, as by being landed at an intermediate port, the rule (as in the case of G.A. sacrifices) is that the contributions are to be in proportion to the arrived or realized values. But if all are lost the burden of the expended ought not to remain upon the interest which at first bore it; and the proper rule seems to be that contributions must be made by all the interests which were at stake when it was made, in proportion to their then values.

Again, the object of the law of G.A. is to put one whose property is sacrificed upon an equal footing with the rest, not upon a better footing. Thus, if goods to the value of £100 have been thrown overboard for the general safety, the owner of those goods must not receive the full £100 in contribution. He himself must bear a part of it, for those goods formed part of the adventure for whose safety the jettison was made; and it is owing to the partial safety of the adventure that any contribution at all is received by him. He, therefore, is made to contribute with the other saved interests towards his own loss, in respect of the amount "made good" to him for that. The full £100 is treated as the amount to be made good, but the owner of the goods is made to contribute towards that upon the sum of £100 thus saved to him.

The same principle has a further consequence. The amount to be made good will not necessarily be the value of the goods or other property in their condition at the time they were sacrificed; so to calculate it would in effect be to withdraw those goods from the subsequent risks of the voyage, and thus to put them in a better position than those which were not sacrificed. Hence, in estimating the amount to be made good, the value of the goods or property sacrificed must be estimated as on arrival, with reference to the condition in which they would probably have arrived had they remained on board throughout the voyage.

The liability to pay G.A. contributions falls primarily upon the owner of the contributing interest, ship, goods or freight. But in practice the contributions are paid by the insurers of the several interests. Merchants seldom have to concern themselves with the subject. And yet in an ordinary policy of insurance there is no express provision requiring the underwriter to indemnify the assured against this liability. The policy commonly contains clauses which recognize such an obligation, e.g. a warranty against average "unless general," or an agreement that G.A. shall be payable "as per foreign statement," or "according to York-Antwerp Rules"; but it does not directly state the obligation. It assumes that. The explanation seems to be that the practice of the underwriter to pay the contribution has been so uniform, and his liability has been so fully recognized, that express provisions were needless. But one result has been that the varying views of the ground of the obligation have been held. One view has been that it is covered by the sue and labour clause of an ordinary policy, by which the insurer agrees to bear his proportion of expenses voluntarily incurred "in and about the defence, safeguard and recovery" of the insured subject. But that has been held to be mistaken by the House of Lords (Aitchison v. Lohre, 1879, 4 A.C. 755). Another view is that the underwriter impliedly undertakes to repay sums which the insurer contributes when the latter is required to indemnify the assured in respect of what would, by the contract, fall upon the underwriter. Expenses voluntarily incurred by the assured with that object are expressly made repayable by the sue and labour clause of the policy. It might well be implied that payments compulsorily required from the assured by law for contributions to G.A., or as salvage for services by salvors, will be undertaken or repaid by the underwriter, the service being for his benefit. But the decision in Aitchison v. Lohre negatives this ground also. The claim was against underwriters on a ship which had been so damaged that the cost of repairs had exceeded her insured value. A claim for the ship's contribution to certain salvage and G.A. expenses which had been incurred, over and above the cost of repairs, was disallowed. The view seems to have been that the insurer is liable for salvage and G.A. payments as losses of the subject insured, and therefore included in the sum insured, not as collateral payments made on his behalf. This bases the claim against the insurer upon a fiction, for there has been no loss of
AVERNUS—AVERROES

the subject insured; in fact, the payment has been for averting such a loss. And it is evident that the insurer is not liable for salvage where the policy is free of particular average, which does not accord with practical

An important question as to an insurer's liability for G.A. arose in the case of the Brigella (1803, F. 189), where a shipowner had incurred expenses which would have been the subject of G.A. contributions, but that he alone was interested in the voyage. There were no contributories. He claimed from the insurers of the ship what would have been the ship's G.A. contribution had there been other persons to contribute in respect of freight or cargo. The claim was disallowed on the ground that there could be no G.A. in such circumstances, and therefore no basis for a claim against the insurer. The liability of the insurer was thus made to depend, not upon the character of the loss, but upon the fact or possibility of contribution. But this was not followed in Montgomery v. Indemnity Mutual M. I. Co. (1901, 1 K.B. 147). There ship, freight and cargo all belonged to the same person. He had insured the cargo but not the ship. The cargo underwriters were held liable to pay a contribution to damage done to the ship by cutting away masts for the general safety. The loss was in theory spread over all the interests at risk, and they had undertaken to bear the cargo's share of the loss. It was found on the question of the accident of whether the interests all belonged to one person or not. This agrees with the view taken in the United States. As to Particular Average, see under INSURANCE: Marine.

AVERNUS, a lake of Campania, Italy, about ½ m. N. of Baiae. It is an old volcanic crater, nearly 2 m. in circumference, now, as in Roman times, filled with water. Its depth is 213 ft., and its height above sea-level 33 ft.; it has no natural outlet. In ancient times it was surrounded by dense forests, and was the centre of many legends. It was represented as the entrance by which both Odysseus and Aeneas descended to the infernal regions, and as the abode of the Cimmerii. Its Greek name, *A'pồpò̀s*, was explained to mean that no bird could fly across it.

Hannibal made a pilgrimage to it in 214 B.C. Agrippa in 37 B.C. converted it into a naval harbour, the *Portus Juliaus*; joining it to the Lucae Lucrinus by a canal, and connecting the latter with the sea, he reduced the distance to Cumae by boring a tunnel over 4 m. in length, now called Grotta della Pace, through the hill on the north-west side of Lake Avernus. After Sextus Pompeius had been subdued, the chief naval harbour was transferred to Misenum. Nero's works for his proposed canal from Baiae to the Tiber (A.D. 64) seem to have begun near Lake Avernus; indeed, according to one theory, the Grotta della Pace would have been a portion of this canal. On the east side of the lake are remains of baths, including a great octagonal hall known as the Temple of Apollo, built of brickwork, and belonging to the 1st century. The so-called Grotto of the Cumaean Sibyl, on the south side, is a rock-cut passage, ventilated by vertical apertures, possibly a part of the works connected with the naval harbour. To the south-east of the lake is the Monte Nuovo, a volcanic hill upheaved in 1538, with a deep extinct crater in the centre. To the south is the Lucus Lucrinus.

Sec J. Beloch, Campanien (2nd ed., Breslau, 1890), pp. 168 seq. (T. As.)

AVERROES [Abûl-Walid Muhammad ibn-Al-Hadîm ibn-Muhammad ibn-Rushd] (1126–1198), Arabian philosopher, was born at Cordova. His early life was occupied in mastering the curriculum of theology, jurisprudence, mathematics, medicine and philosophy, under the approved teachers of the time. The years of his prime fell during the last period of Mohammedan rule in Spain under the Almohades (g.n.). It was Ibn-Tufail (Abubacer), the philosophical vizir of Yusuf, who introduced Averroes to that prince, and Avenzoar (Ibn-Zahr), the greatest of Moslem physicians, was his friend. Averroes, who was versed in the Malekite system of law, was made cadi of Seville (1169), and in similar appointments the next twenty-five years of his life were passed. We find him at different periods in Seville, Cordova and Morocco, probably as physician to Yusuf al-Mansur, who took pleasure in engaging him in discussions on the theories of philosophy and their bearing on the faith of Islam. But science and free thought then, as now, in Islam, depended almost solely on the tastes of the wealthy and the favour of the monarch. The ignorant fanaticism of the multitude viewed speculative studies with deep dislike and distrust, and deemed any one a Zendik (infidel) who did not rest content with the natural science of the Koran. These smouldering hatreds burst into open flame about the year 1195. Averroes was accused of heretical opinions and pursuits, stripped of his honours, and banished to a place near Cordova, where his actions were closely watched. At the same time efforts were made to stamp out all liberal culture in Andalusia, so far as it went beyond the little medicine, arithmetic and astronomy required for practical life. But the storm soon passed. Averroes was recalled to Morocco when the transient passion of the people had been satisfied, and for a brief period survived his restoration to honour. He died in the year before his patron, al-Mansur, with whom (in 1199) the political power of the Moslems came to an end, as did the culture of liberal science with Averroes. The philosopher left several sons, some of whom became jurists, and others his grandsons. One of them has left behind him expounding his father's theories in the intellect. The personal character of Averroes is known to us only in a general way, and as we can gather it from his writings. His clear, exhaustive and dignified style of treatment evidences the rectitude and nobility of the man. In the histories of his own nation he has little place; the renown which spread in his lifetime to the East ceased with his death, and he left no school. Yet, from a note in a manuscript, we know that he had intelligent readers in Spain more than a century afterwards. His historic fame came from the Christian Schoolmen, whom he almost initiated into the system of Aristotle, and who, but vaguely discerning the expositors who preceded, admired in his commentaries the accumulated results of two centuries of labours.

The literary works of Averroes include treatises on jurisprudence, grammar, astronomy, medicine and philosophy. In 1840 a work of Averroes was for the first time published in Arabic by the Bavarian Academy, and a German translation appeared in 1875 by the editor, J. Müller. It is a treatise entitled Philosophy and Theology, and, with the exception of a German version of the essay on the conjunction of the intellect and the will, is the first translation which enables the non-Semitic scholar to form a complete idea of Averroes. The Latin translations of most of his works are barbarous and obscure. A great part of his writings, particularly on jurisprudence and astronomy, as well as essays on special logical subjects, prolegomena to philosophy, criticisms on Avicenna and Alfarabius (Fârâbî), remain in manuscript in the Escorial and other libraries. The Latin editions of his medical works include the *Colliget* (i.e. *Kulliyat* or, summary), a résumé of medical science, and a commentary on Avicenna's poem on medicine; but Averroes, in medical renown, always stood far below Avicenna. The Latin editions of his philosophical works comprise the Commentaries on Aristotle, the Destructio Delectu, the De Substantia Orbis and a double treatise De Animae Beautiludine. The Commentaries of Averroes fall under three heads:—the larger commentaries, in which a paragraph is quoted at large, and its clauses expounded one by one; the medium commentaries, which cite only the first words of a section; and the paraphrases or analyses, treatises on the subjects of the Aristotelian books. The larger commentary was an innovation of Averroes; for Avicenna, copied by Albertus Magnus, gave under the rubrics furnished by Aristotle works in which, though the materials were borrowed, the exposition was his own. The great commentaries exist only for the Posterior Analytics, De Caelo, De Anima and Metaphysics. On the History of Animals no commentary at all exists, and Plato's Republic is substituted for the then inaccessible Politics. The Latin editions of these works between 1480 and 1580 number about 100. The first
appeared at Padua (1472); about fifty were published at Venice, the best-known being that by the Juntas (1552-1553) in ten volumes folio.

**AVERRUCATOR—AVIANSUS**

AVERRUCATOR, a form of long shears used in arboriculture for "averrucating" or pruning off the higher branches of trees, &c. The word "averrucation" (from Lat. *averrucare*, to ward off, remove mischief) gilded into meaning to "weed the ground," "prune vines," &c., by a supposed derivation from the Lat. *ab*, off, and *eruncare*, to weed out, and it was spelt "aberrucate" to suit this; but the New English Dictionary regards such a derivation as impossible.

**AVERSA**, a town and episcopal see of Campania, Italy, in the province of Caserta, 14 m. S.S.W. by rail from Caserta, and 134 m. N. by rail from Naples, from which there is also an electric tramway. Pop. (1901) 23,477. Aversa was the first place in which the Normans settled, it being granted to them in 1097 for the help which they had given to Duke Sergius of Naples against Pandulf IV. of Capua. The Benedictine abbey of S. Lorenzo preserves a portal of the 11th century. There is also a large lunatic asylum, founded by Joachim Murat in 1813.

**AVESNES**, a town of northern France, capital of an arrondissement in the department of Nord, on the Helpe, 28 m. S.E. of Valenciennes by rail. Pop. (1906) 5076. The town is the seat of a sub-prefecture, and has a tribunal of first instance, a chamber of commerce and a communal college. Its church of St Nicholas (16th century) has a tower 200 ft. high, with a fine chime of bells. The chief industry of the town is wool-spinning, and there is trade in wood. Avesnes was founded in the 11th century, and formed a countship which in the 15th century passed to the house of Burgundy and afterwards to that of Habsburg. In 1477 it was destroyed by Louis XI. By the treaty of the Pyrenees (1659) it came into the possession of the French, and was fortified by Vauban. It was captured by the Prussians in 1815.

**AVEYRON**, a department of southern France, bounded N. by Cantal, E. by Lozère and Gard, S.W. by Tarn and W. by Tarn-et-Garonne and Lot. Area, 3386 sq. m. Pop. (1906) 377,299. It corresponds nearly to the old district of Rouergue, which gave its name to a countship established early in the 9th century, and united with that of Toulouse towards the end of the 11th century. The earliest known natives of this region were the Celtic Rutheni, to whom the numerous megalithic monuments found in the department are attributed. Aveyron lies on the southern border of the central plateau of France. Its chief rivers are the Lot in the north, the Aveyron in the centre and the Tarn in the south, all tributaries of the Garonne. They flow from east to west, following the general slope of the department, and divide it into four zones. In the north-east, between the Lot and its tributary the Truyère, lies the lonely pastoral plateau of the Vézère, dominated by the volcanic mountains of Aubrac, which form the eastern limit of the department and include its highest summit (4760 ft.). Entering, at the confluence of the Lot and the Truyère, is one of the many picturesque towns of the department. Between the Lot and the Aveyron is a belt of *causes* or monotonous limestone table-lands, broken here and there by profound and beautiful gorges—a type of scenery characteristic of Aveyron. This zone is also watered by the Dourdou du Nord, a tributary of the Lot. The salient feature of the region between the Tarn and the Aveyron is the plateau of the Séga, bordered on the east by the heights of Lévezou and Palanges and traversed from east to west by the deep valley of the Vair, a tributary of the Aveyron. The country south of the Tarn is occupied in great part by the huge plateau of Larzac, which lies between the Cause Noir and the Cause St Afrique, the three forming the south-western termination of the Cévennes. On the Causse Noir is found the fantastic chaos of rocks and precipices known as Montpellier-le-Vieux, resembling the ruins of a huge city. The climate of Aveyron varies from the extreme rigour in the mountains to mildness in the sheltered valleys; the south wind is sometimes of great violence. Wheat, rye and oats are the chief cereals cultivated, the soil of Aveyron being naturally poor. Other crops are potatoes, colza, hemp and flax. The mainstay of the agriculture of the department is the raising of live-stock, especially cattle of the Aubrac breed, for which Laguiole is an important market. The wines of Entraygues, St Georges, Bouillic and Najac have some reputation; in the Séga chestnuts form an important element in the food of the peasants, and the walnut, cider-apple, mulberry (for the silk-worm industry), and plum are among the fruit trees grown. The production of Roquefort cheese is prominent among the agricultural industries. They are made from the milk of the large flocks of the plateau of Larzac, and the choicest are ripened in the even temperature of the caves in which it overhangs Roquefort. The minerals found in the department include the coal of the basins of Aubin and Rodez as well as iron, zinc and lead. Quarries of various kinds of stone are also numerous. Some of the chief industrial centres are Decazeville, which has metallurgical works, and Millau, where leatherwork is manufactured. The manufacture of gloves has attained considerable importance. Wool-wearing and the manufacture of woollen goods, machinery, chemicals and bricks are among the other industries.

There are five arrondissements, of which the chief towns are Rodez, capital of the department, Espalion, Millau, St Affrique and Villefranche, with 43 cantons and 304 communes. Rodez is the seat of a bishopric, the diocese of which comprises the department. Aveyron belongs to the 16th military region, and to the académie or educational circumscription of Toulouse. Its court of appeal is at Montpellier. The department is traversed by the lines both of the Orléans and Southern railways. The more important towns are Rodez, Millau, St Affrique, Villefranche-de-Rouergue and Decazeville. The following are also of interest.—Sauvetere, founded in 1251, a striking example of the bastide (90.) of that period; Conques, which has a remarkable abbey-church of the 11th century like St Sernin of Toulouse in plan and possessing a rich treasury of reliquaries, &c.; Espalion, where the nearest old buildings there are the remains of a feudal stronghold and a fortified church of the 15th century; Najac, which has the ruins of a magnificent château of the 13th century; and Sylvans, with a church of the 12th century, once attached to a Cistercian abbey.

**AVEZZANO**, a town of the Abruzzi, Italy, in the province of Aquila, 67 m. E. of Rome by rail and 38 m. S. of Aquila by road. Pop. (1901) 9442. It has a fine and well-preserved castle, built in 1490 by Gentile Virginio Orsini; it is square, with round towers at the angles. Avezzano is on the main line from Rome to Castellammare Adriatico; a branch railway diverges to Rocca-secca, on the line from Naples to Rome. The Lago Fucino lies 1½ m. to the east.

**AVIANUS**, a Latin writer of fables, placed by some critics in the age of the Antonines, by others as late as the 6th century a.D. He appears to have lived at Rome and to have been a heathen. The 42 fables which bear his name are dedicated to a certain Theodosius, whose learning is spoken of in most flattering terms. He may possibly be Macrobius Theodosius, the author of the *Saturnalia*; some think he may be the emperor of that name. Nearly all the fables of this author are derived, who was probably Avianus's source of inspiration, but as Babrius, who wrote in Greek, and Avianus speaks of having made an elegiac version from a rough Latin copy, probably a prose paraphrase, he was not indebted to the original. The language and metre are on the whole correct, in spite of deviations from classical usage, chiefly in the management of the pentameter. The fables soon became popular as a school-book. Promythia and epimythia (introductions and morals) and paraphrases, and imitations were frequent, such as the *Novus Avianus* of Alexander Neckam (12th century).

**Editions.**—Cannegieter (1731), Lachmann (1845), Fröhner (1862),
AVIARY (from Lat. avis, a bird), called by older writers "volary," a structure in which birds are kept in a state of captivity. While the habit of keeping birds in cages dates from a very remote period, it is probable that structures worthy of being termed aviaries were first used by the ancient Romans, chiefly for the process of fattening birds for the table. In Varro's time, 116-127 B.C., aviaries or "ornithones" (from Gr. ὠρνίθων, bird) were common. These consisted of two kinds, those constructed for pleasure, in which were kept nightingales and other song-birds, and those used entirely for keeping and fattening birds for market or for the tables of their owners. Varro himself had an aviary for song-birds exclusively, while Lucullus combined the two classes, keeping birds both for pleasure and as delicacies for his table. The keeping of birds for pleasure, however, was very rarely indulged in, while it was a common practice with poulterers and others to have large ornithones in the city or at Sabiniun for the fattening of thrushes and other birds for food. One was composed of four high walls and a roof, and were lighted with a very few small windows, as the birds were considered to pine less if they could not see their free companions outside. Water was introduced by means of pipes, and conducted in narrow channels, and the birds were fed chiefly upon dried figs, carefully peeled, and chewed into a pulp by persons hired to perform this operation.

Turtle-doves were fattened in large numbers for the market on wheat and millet, the latter being moistened with sweet wine; but thrushes were chiefly in request, and Varro mentions one ornithon from which no less than five thousand of these birds were sold for the table in one season.

The habit of keeping birds in aviaries, as we understand the term, for the sake of the pleasure they afford their owners and for studying their habits is, however, of comparatively recent date. The beginning of geographical research in the 15th century brought with it the desire to keep and study at home some of the beautiful forms of bird-life which the explorers came across, and hence it became the custom to erect aviaries for the reception of these creatures. In the 16th century, in the early part of which the canary-bird was introduced into Europe, aviaries were not uncommon features of the gardens of the wealthy, and Bacon refers to them in his essay on gardening (1597). Elizabeth of Bohemia, the daughter of James I. of England, when a child, had an outdoor aviary at Coombe Abbey near Coventry, the back and roof of which were formed of natural rock, in which were kept birds of many species from many countries.

Within recent years the method of keeping birds in large aviaries has received considerable attention, and it is fully recognized that by so doing, not only do we derive great pleasure, but our knowledge of avian habits and mode of living can thereby be very considerably increased.

An aviary may be of almost any size, from the large cage known, on account of its shape, as the "Crystal Palace aviary," to a structure as large as a church; and the term is sometimes applied to the room of a house with the windows covered with wire-netting; but as a rule it is used for outdoor structures, composed principally of wire-netting supported on a framework of either iron or wood. For quite hardy birds little more than this is necessary, providing that protection is given in the form of growing trees and shrubs, rock-work or rough wooden shelters. For many of the delicate species, however, which hail from tropical countries, warmth must be provided during the inclement months of the year, and thus a part at least of an aviary designed for these birds must be in the form of a wooden or brick house which can be shut up in cold weather and artificially warmed.

The ideal aviary, probably, is that which is constructed in two parts, viz. a well-built house for the winter, opening out into a large wire enclosure for use in the summer months. The doors between the two portions may be of wood or glazed. The part intended as the winter home of the birds is best built in brick or stone, as these materials are practically vermin-proof and the temperature in such a building is less variable than that in a thin wooden structure. The floor should be of concrete or brick, and the house should be fitted with an efficient heating apparatus from which the heat is distributed by means of hot-water pipes. Any arrangement which would permit the escape into the aviary of smoke or noxious fumes is to be strongly condemned. Such a house must be well lighted, preferably by means of skylights; but it is a mistake to have the whole roof glazed, at least half of it should be of wood, covered with slates or tiles. Perches consisting of branches of trees with the bark adhering should be fixed up, and, if small birds are to be kept, bundles of bushy twigs should be securely fixed up in corners under the roofs.

The outer part, which will principally be used during the summer, though it will do most birds good to be let out for a few hours on mild winter days also, should be as large as possible, and constructed entirely of wire-netting stretched on a framework of wood or iron. If the latter material is selected, stout gas-piping is both stronger and more easily fitted together than solid iron rods.

If the framework be of wood, this should be creosoted, preferably under pressure, or painted with three coats of good lead paint, the latter preservative also being used if iron is the material selected.

The wire-netting used may be of almost any sized mesh, according to the sized birds to be kept, but as a general rule the smallest mesh, such as half or five-eighths of an inch, should be used, as it is practically vermin-proof, and allows of birds of any size being kept. Wire-netting for aviaries should be of the best quality, and well galvanized. The new interlinked type is less durable than the old mesh type, though perhaps it looks somewhat neater when fixed.

Provision must be made for the entire exclusion of such vermin as rats, stoats and weasels, which, if they were to gain access, would commit great havoc amongst the birds. The simplest and most effectual method of doing this is by sinking the whole floor of the ground all round the aviary, and then turning it outwards for a distance of another foot as shown in the annexed cut (fig. 1).

The outer part of the aviary should be turfed and planted with evergreen and deciduous shrubs, and be provided with some means of supplying an abundance of pure water for the birds to drink and bathe in; and a gravel path should not be forgotten.

Perhaps the most useful type of aviary is that built as above described, but with several compartments, and a passage at the back by which any compartment may be visited without the necessity of passing through and disturbing the birds in other compartments. Fig. 2 represents a ground plan of an aviary of this type divided into four compartments, each with an inner house 10 ft. square, and an outer flight of double that area. The outer flights are intended to be turfed, and planted with shrubs, and the gravel path has a glazed roof above it by which it is kept dry in wet weather. Shallow water-basins are provided, which should be supplied by means of an underground pipe and a cock which can be turned on from outside the aviary; and they must be connected with a properly laid drain by means of a waste plug and an overflow pipe.

An aviary should always be built with a southern or south-eastern aspect, and, where possible, should be sheltered from the north, north-east and north-west by a belt of fir-trees, high wall or bank, to protect the birds from the biting winds from these quarters.

When parrots of any kind are to be kept it is useless to try...
to grow any kind of vegetation except grass, and even this will be demolished unless the aviary is of considerable size. The larger parrots will, in fact, bite to pieces not only living trees but also the woodwork of their abode, and the only really suitable materials for the construction of an aviary for these birds are brick or stone and iron; and the wire-netting used must be of the stoutest gauge or it will be torn to pieces by their strong bills.

The feeding of birds in aviaries is, obviously, a matter of the utmost importance, and, in order that they may have what is most suitable, the aviculturist should find out as much as possible of the wild life of the species it wishes to keep, or if little or nothing is known about their mode of living, as is often the case with rare forms, of nearly related species whose habits and food are probably much the same, and he should endeavour to provide food as nearly as possible resembling that which would be obtained by the birds when wild. It is often, however, impossible to supply precisely the same food as would be obtained by the birds had they their liberty, but a substitute which suits them well can generally be obtained. The majority of the parrot tribe subsist principally upon various nuts, seed and fruit, while some of the smaller parakeets or paroquets appear to feed almost exclusively upon the seeds of various grasses. Almost all of these are comparatively easy to treat in captivity, the larger ones being fed on maize, sunflower-seed, hemp, dari, oats, canary-seed, nuts and various ripe fruits, while the grass-parakeets thrive remarkably well on little besides canary-seed and green food, the most suitable of which is grass in flower, chickweed, groundsel and various seed-bearing weeds. But there is another large group of parrots, the Loridas or brush-tongued parrots, some of the most interesting and brightly coloured of the tribe, which, when wild, subsist principally upon the pollen and nectar of flowers, notably the various species of Eucalyptus, the filimented tongues of these parrots being peculiarly adapted for obtaining this. In captivity these birds have been found to live well upon sweetened milk-sop, which is made by pouring boiling milk upon crumbled bread or biscuit. They frequently learn to eat seed like other parrots, but, if fed exclusively upon this, are apt, especially if deprived of abundance of exercise, to suffer from fits which are usually fatal. Fruit is also readily eaten by the lories and lorikeets, and should always be supplied.

The foreign doves and pigeons form a numerous and beautiful group which are mostly hardy and easily kept and bred in captivity. They are for the most part grain-feeders and require only small corn and seeds, though a certain group, known as the fruit-pigeons, are fed in captivity upon soft fruits, berries, boiled potato and soaked grain.

The various finches and finch-like birds form an exceedingly large group and comprise perhaps the most popular of foreign aviary birds. The weaver-birds of Africa are mostly quite hardy and very easily kept, their food consisting, for the most part, of canary-seed. The males of these birds are, as a rule, gorgeously attired in brilliant colours, some having long flowing tail-feathers during the nuptial season, while in the winter their showy dress is replaced by one of sparrow-like sombreness. The grass-finches of Australasia contain some of the most brilliantly coloured birds, the beautiful grass-finch (Poephila Mirabilis) being resplendent in crimson, green, mauve, blue and yellow. Most of these birds build their nests, and many rear their young, successfully in outdoor aviaries, their food consisting of canary and millet seeds, while flowering grasses provide them with an endless source of pleasure and wholesome food. The same treatment suits the African waxbills, many of which are extremely beautiful, the crimson-eared waxbill or "cordon-blue" being one of the most lovely and frequently imported. These little birds are somewhat delicate, especially when first imported, and during the winter months require artificial warmth.

There is a very large group of insectivorous and fruit-eating birds very suitable for aviculture, but their mode of living necessarily involves considerable care on the part of the aviculturist in the preparation of their food. Many birds are partially insectivorous, feeding upon insects when these are plentiful, and upon various seeds at other times. Numbers of species again which, when adult, feed almost entirely upon grain, feed their young, especially during the early stages of their existence, upon insects; while others are exclusively insect-eaters at all times of their lives. All of these points must be considered by those who would succeed in keeping and breeding birds in aviaries.

It would be almost an impossibility to keep the purely insectivorous species, were it not for the fact that they can be gradually accustomed to feed on what is known as "insectivorous" or "insectile" food, a composition of which the principal ingredients generally consist of dried ants' cocoons, dried flies, dried powdered meat, preserved yolk of egg, and crumb of bread or biscuit. This is moistened with water or mixed with mashed boiled potato, and forms a diet upon which most of the insectivorous birds thrive. The various ingredients, or the food ready made, can be obtained at almost any bird-lancier's although it is a good staple diet for these birds, the addition of mealworms, carob-pulps, grubs, spiders and so forth is often a necessity, especially for purely insectivorous species.

The fruit-eating species, such as the tanagers and sugar-birds of the New World, require ripe fruit in abundance in addition to a staple diet such as that above described, while for such birds as feed largely upon earth-worms, shredded raw meat is added with advantage.

Many of the waders make very interesting aviary birds, and require a diet similar to that above recommended, with the addition of chopped raw meat, mealworms and any insects that can be obtained.

Birds of prey naturally require a meat diet, which is best given in the form of small, freshly killed mammals and birds, the fur or feathers of which should not be removed, as they aid digestion. The majority of wild birds, from whatever part of the world they may come, will breed successfully in suitable aviaries providing proper nesting sites are available. Large bundles of brushwood, fixed up in sheltered spots, will afford accommodation for many kinds of birds, while some will readily build in evergreen shrubs if these are grown in their enclosure. Small boxes and baskets, securely fastened to the wall or roof of the aviary.

1 It has recently been stated by certain medical men that egg-food in any form is an undesirable diet for birds, owing to its being peculiarly adapted to the multiplication of the bacillus of septicemia, a disease which is responsible for the death of many newly imported birds. It is a significant fact, however, that insectivorous species, which are those principally fed upon this substance, are not nearly so susceptible to this disease as seed-eating birds which rarely taste egg: and in spite of what has been written concerning its harmfulness, the large majority of aviculturists use it, in both the fresh and the preserved state, with no apparent ill effects, but rather the reverse.
sheltered part of an aviary, will be appropriated by such species as naturally build in holes and crevices. Parrots, when wild, lay their eggs in hollow trees, and occasionally in holes in rocks, making no nests, but merely scraping out a slight hollow in which to deposit the eggs. For these birds hollow logs, with small entrance holes near the top, or boxes, varying in size according to the size of the parrots which they are intended for, should be supplied. In providing nesting accommodation for his birds the aviculturist must endeavour to imitate their natural surroundings and supply sites as nearly as possible similar to those which the birds, to whatever order they may belong, would naturally select.

Aviculture is a delightful pastime, but it is also far more than this; it is of considerable scientific importance, for it admits of the living birds being studied in a way that would be quite impossible otherwise. There are hundreds of species of birds, from all parts of the world, the habits of which are almost unknown, but which may be kept without difficulty in suitable aviaries. Many of these birds cannot be studied satisfactorily in a wild state by reason of their shy nature and retiring habits, not to mention the rarity and the impossibility, so far as most people are concerned, of visiting their native haunts. In suitable large aviaries, however, their nesting habits, courtship, display, incubation, moult and so forth can be accurately observed and recorded. The keeping of birds in aviaries is therefore a practice worthy of every encouragement, so long as the aviaries are of sufficient size and suitable design to allow of the birds exhibiting their natural habits; for in a large aviary they will reveal the secrets of their nature as they never would do in a cage or small aviary.

D. S. S.

AVICENNA [Abū 'Ali Al-Husain ibn 'Abdallāh ibn Sinā] (980–1037), Arabian philosopher, was born at Alisha in the district of Bokhara. His mother was a native of the place; his father, a Persian from Balkh, filled the post of tax-collector in the neighbouring town of Harmattin, under Nuh II., ibn Mansur, the Samarid amir of Bokhara. On the birth of Avicenna's younger brother the family migrated to Bokhara, then one of the chief cities of the Moslem world, and famous for a culture which was older than its conquest by the Saracens. Avicenna was put in charge of a tutor, and his precocity soon made him the marvell of his neighbours,—as a boy of ten who knew by rote the Koran and much Arabic poetry besides. From a greengrocer he learned arithmetic; and higher branches were begun under one of those wandering scholars who gained a livelihood by cures for the sick and lessons for the young. Under him Avicenna read the Isagoge of Porphyry and the first propositions of Euclid. But the pupil soon found his teacher to be but a charlatan, and betook himself, aided by commentaries, to master logic, geometry and the Almagest. Before he was sixteen he not merely knew medical theory, but by gratuitous attendance on the sick had, according to his own account, discovered new methods of treatment. For the next year and a half he worked at the higher philosophy, in which he encountered greater obstacles. In such moments of baffled inquiry he would leave his books, perform the requisite ablutions, then hie to the mosque, and continue in prayer till light broke on his difficulties. Deep into the night he would continue his studies, stimulating his senses by occasional cups of wine, and even in his dreams problems would pursue him and work out their solution. Forty times, it is said, he read through the Metaphysics of Aristotle, till the words were imprinted on his memory; but their meaning was hopelessly obscure, until one day they found illumination from the little commentary by Fārābī (q.v.), which he bought at a bookstall for the small sum of three dirhems. So great was his joy at the discovery, thus made by help of a work from which he had expected only mystery, that he hastened to return thanks to God, and bestowed an alms upon the poor. Thus, by the end of his seventeenth year his apprenticeship of study was concluded, and he went forth to find a market for his accomplishments.

His first appointment was that of physician to the amir, who owed him his recovery from a dangerous illness (997). Avicenna's chief reward for this service was access to the royal library of the Samanids (q.v.), well-known patrons of scholarship and scholars. When the library was destroyed by fire not long after, the enemies of Avicenna accused him of burning it, in order for ever to conceal the sources of his knowledge. Meanwhile, he assisted his father in his financial labours, but still found time to write some of his earliest works.

At the age of twenty-two Avicenna lost his father. The Samarid dynasty came to its end in December 1004. Avicenna seems to have declined the offers of Mahmūd the Ghaznevid, and proceeded westwards to Urjensh in the modern Khiva, where the vizier, regarded as a friend of scholars, gave him a small monthly stipend. But the pay was small, and Avicenna wandered from place to place through the districts of Nishapur and Merv to the borders of Khorasan, seeking an opening for his talents. Shams al-Mā‘lī Qābūs, the generous ruler of Dallam, himself a poet and a scholar, with whom he had hoped to find an asylum, was about that date (1012) starved to death by his own revolted soldiers. Avicenna himself was at this season stricken down by a severe illness. Finally, at Jorjān, near the Caspian, he met with a friend, who bought near his own house a dwelling in which Avicenna lectured on logic and astronomy. For this patron several of his treatises were written; and the commencement of his Canon of Medicine also dates from his stay in Hyrcania.

He subsequently settled at Rai, in the vicinity of the modern Teheran, where a son of the last amir, Majd Addaula, was nominal ruler, under the regency of his mother. At Rai about thirty of his shorter works are said to have been composed. But the constant feuds which raged between the regent and her second son, Shams Addaula, compelled the scholar to quit the place, and after a brief sojourn at Kazwin, he passed southwards to Hamadān, where that prince had established himself. At first he entered into the service of a high-born lady; but ere long the amir, hearing of his arrival, called him in as medical attendant, and sent him back with presents to his dwelling. Avicenna was even raised to the office of vizier; but the turbulent soldiery, composed of Kurds and Turks, mutinied against their nominal sovereign, and demanded that the new vizier should be put to death. Shams Addaula consented that he should be banished from the country. Avicenna, however, remained hidden for forty days in a sheik's house, till a fresh attack of illness induced the amir to restore him to his post. Even during this perturbed time he prosecuted his studies and teaching. Every evening extracts from his great works, the Canon and the Sanatio, were dictated and explained to his pupils; among whom, when the lesson was over, he spent the rest of the night in festive enjoyment with a band of singers and players. On the death of the amir Avicenna ceased to be vizier, and hid himself in the house of an apothecary, where, with intense assiduity, he continued the composition of his works. Meanwhile, he had written to Abu Y‘ār, the prefect of Isfahan, offering his services; but the new amir of Hamadān getting to hear of this correspondence, and discovering the place of Avicenna's concealment, incarcerated him in a fortress. War meanwhile continued between the rulers of Isfahan and Hamadān; in 1024 the former captured Hamadān and its towns, and expelled the Turkish mercenaries. When the storm had passed Avicenna returned with the amir to Hamadān, and carried on his literary labours; but at length, accompanied by his brother, a favourite pupil, and two slaves, made his escape out of the city in the dress of a Sufite ascetic. After a perilous journey they reached Isfahan, and received an honourable welcome from the prince. The remaining ten or twelve years of Avicenna's life were spent in the service of Abu Y‘ār; Alī Addaula, whom he accompanied as physician and general literary and scientific adviser, even in his numerous campaigns. During these years he began to study literary matters and philology, instigated, it is asserted, by

1 There is, however, one true nest-building parrot, the greybracted parakeet (Myopsitta monachus), which constructs a huge nest of twigs. The true love-birds (Agapornis) may also be said to build nests, for they line their nest-hole with strips of plant bark.
criticisms on his style. But amid his restless study Avicenna never forgot his love of enjoyment. Unusual bodily vigour enabled him to combine severe devotion to work with facile indulgence in sensual pleasures. His passion for wine and women was almost as well known as his learning. Versatile, light-hearted, boastful and pleasure-loving, he contrasts with the nobler and more intellectual character of Averroes. His boots of pleasure gradually weakened his constitution; a severe colic, which seized him on the march of the army against Hamadân, was checked by remedies so violent that Avicenna could scarcely stand. On a similar occasion the disease returned; with difficulty he reached Hamadân, where, finding the disease gaining ground, he refused to keep up the regimen imposed, and resigned himself to his fate. On his deathbed remorse seized him; he bestowed his goods on the poor, restored unjust gains, freed his slaves, and every third day till his death listened to the reading of the Koran. He died in June 1037, in his fifty-eighth year, and was buried in Hamadân.

It was mainly accident which determined that from the 12th to the 17th century Avicenna should be the guide of medical study in European universities, and eclipse the names of Rhazes, Ali ibn al-Abbas and Avenzoar. His work is not essentially different from those of Galen and Al; all present the doctrine of Galen, and through Galen the teaching of Hippocrates, modified by the system of Aristotle. But the Canon of Avicenna is distinguished from the Al-Hawi (Continents) or Summary of Rhazes by its greater method, due perhaps to the logical studies of the former, and entitling him to his surname of Prince of the Physicians. The work has been variously appreciated in subsequent ages, some regarding it as a treasury of wisdom, and others, like Avenzoar, holding it useful only as waste paper. In modern times it has been more criticized than read. The vice of the book is excessive classification of bodily faculties, and over-subtlety in the discrimination of diseases. It includes five books; of which the first and second treat of physiology, pathology and hygiene, the third and fourth deal with the methods of treating disease, and the fifth describes the composition and preparation of remedies. This last part contains some contingent of personal observation. He is, like all his counymen, amply in the enumeration of symptoms, and is said to be inferior to Ali in practical medicine and surgery. He introduced into medical theory the four causes of the Peripatetic system, of natural history and botany he pretends to no special knowledge. Up to the year 1550, or thereabouts, the Canon was still used as a text-book in the universities of Louvain and Montpellier.

About 100 treatises are ascribed to Avicenna. Some of them are tracts of a few pages, others are works extending through several volumes. The best-known amongst them, and that to which Avicenna owed his European reputation, is the Canon of Medicine; an Arabic edition of it appeared at Rome in 1593, and a Hebrew version at Naples in 1421. Of the Latin version there were about thirty editions, founded on the original translation by Gerard of Cremona. The 15th century has the honour of composing the great commentary on the text of the Canon, grouping around it all that theory had imagined, and all that practice had observed. Other medical works translated into Latin are the Medicamenta Cordisia, Canticum Medicinae, Taelatus de Suroco Aceloso. Scarcely any member of the Arabian circle of the sciences, including theology, philology, mathematics, astronomy, physics and music, was left untouched by the treatises of Avicenna, many of which probably varied little, except in being commissioned by a different patron and having a different form or external title. The most learned treatise on alchemy, but several others have been falsely attributed to him. His book on animals was translated by Michael Scot. His Logic, Metaphysics, Physics, De Caelo, are treatises giving a synoptic view of Aristotelian doctrine. The Logic and Metaphysics have been printed more than once, the latter, e.g., at Venice in 1493, 1495 and 1546. Some of his shorter essays on medicine, logic, &c., take a poetical form (the poem on logic was published by Schmoelders in 1836). Two encyclopaedic treatises, dealing with philosophy, are often mentioned. The larger, Al-Shifâ (Sanatio), exists nearly complete in manuscript in the Bodleian library and elsewhere; part of it on the De Anima is preserved at Pavia (1490) as the Liber Sextus Naturalium, and the lost account of his medico-philosophical system, given by Shahrastani seems to be mainly an analysis, and in many places a reproduction, of the Al-Shifâ. A shorter form of the work is known as the An-najât (Librario). The Latin editions of part of these works have been modified by the corrections which the monastic editors confess that they applied. There is also a Philosophia Orientalis, mentioned by Roger Bacon, and now lost, which according to Averroes was pantheistic in tone.

For Avicenna's life, see Ibn Khallikan's Biographical Dictionary, translated by W. de S. L. 1822; F. W. Wustenfeld's Geschichte der arabischen Astronomie und Naturforscher (Göttingen, 1840). For his medicine, see Sprengel, Histoire de la Médecine; and for his philosophy, see Shahristani, German trans. vol. ii. 213-332; K. Prantl, Geschichte der Logik, ii. 318-361; A. Stöchel, Phil. d. Mittelalters; ii. 2-6; Munk, Mandes, 352-366; D. Hanseberg in the Abhandlungen der phil.-philolog. Ges. der bayerischen Academie (1867); and Carra de Vaux, Avicenne (Paris, 1900). For list of extant works see C. Brockelmann's Geschichte der arabischen Literatur (Weimar, 1898), vol. i. pp. 452-458.

AVIGNON—AVIENUS

AVIGNON, a town of Piedmont, Italy, in the province of Turin, 14 m. W. by rail from the town of Turin. Pop. (1901) 4629. It has medieval buildings of some interest, but is mainly remarkable for its large dynamite factory, employing over 300 workman.

AVIGLIANA, a town of Piedmont, Italy, in the province of Turin, 14 m. W. by rail from the town of Turin. Pop. (1901) 4629. It has medieval buildings of some interest, but is mainly remarkable for its large dynamite factory, employing over 300 workman.

AVIGNON, a city of south-eastern France, capital of the department of Vaucluse, 143 m. S. of Lyons on the railway between Paris and Rome. Pop. (1900) 35,536. Avignon, which lies on the left bank of the Rhone, a few miles below its confluence with the Durance, occupies a large oval-shaped area, not fully populated, and covered in great part by parks and gardens. A suspension bridge leads over the river to Villeneuve-lès-Avignon (q.v.), and a little higher up, a picturesque ruined bridge of the 12th century, the Pont Saint-Bénézet, projects into the stream. Only four of the eighteen piles are left; on one of them stands the chapel of Saint-Bénézet, a small Romanesque building. Avignon is still encircled by the ramparts built by the popes in the 14th century, which offer one of the finest examples of medieval fortification in existence. The walls, which are of great strength, are surmounted by machicolated battlements, flanked at intervals by thirty-nine massive towers and pierced by several gateways, three of which date from the 14th century. The whole is surrounded by a line of pleasant boulevards. The life of the town is almost confined to the Place de l'Hôtel de Ville and the Cours de la République, which leads out of it and extends to the ramparts. Elsewhere the streets are narrow, quiet, and, for the most part, badly paved. At the northern extremity of the city lies the Rocher des Doms, which rises from the river's edge and forms a plateau stretching southwards nearly to the Place de l'Hôtel de Ville. Its summit is occupied by a public garden and, to the south of this, by the cathedral of Notre-Dame des Doms and the Palace of the Popes. The cathedral is a Romanesque building, mainly of the 12th century, the most prominent feature of which is the gabled statue of the Virgin which surmounts the western tower. Among the many works of art in the interior, the most beautiful is the mausoleum of Pope John XXII, a masterpiece of Gothic
The cathedral is almost dwarfed by the Palace of the Popes, a sombre assemblage of buildings, which rises at its side and covers a space of more than 1 acres. Begun in 1316 by John XXII., it was continued by succeeding popes until 1370, and is in the Gothic style; in its construction everything has been sacrificed to strength, and though the effect is imposing, the place has the aspect rather of a fortress than of a palace. It was for long used as a barracks and prison, to the exigencies of which the fine apartments were ruthlessly adapted, but it is now municipal property. Among the minor churches of the town are St. Pierre, which has a graceful façade and richly carved doors, St. Didier and St. Agricol, all three of Gothic architecture. The most notable of the civil buildings are the hôtel de ville, a modern building with a belfry of the 14th century, and the old Hôtel des Monnaies, the papal mint which was built in 1610 and is now used as a music-school. The Calvet Museum, so named after F. Calvet, physician, who in 1810 left his collections to the town, is rich in inscriptions, bronzes, glass and other antiquities, and in sculptures and paintings. The library has over 140,000 volumes. The town has a statue of a Persian, Jean Althen, who in 1765 introduced the culture of the madder plant, which long formed the staple trade, and is still an important branch of it. In 1873 John Stuart Mill died at Avignon, where he was buried in the cemetery. For the connection of Petrarch with the town see Petrarch.

Avignon is subject to violent winds, of which the most disastrous is the mistral. The popular proverb is, however, somewhat exaggerated, Avenio ventosa, sine vento venenosa, cum vento fastidiosa (windy Avignon, pest-ridden when there is no wind, wind-pestered when there is). Avignon is the seat of an archbishop and has tribunals of first instance and of commerce, a council of trade-arbitrators, a lycée, and training college, a chamber of commerce and a branch of the Bank of France. It is in the midst of a fertile district, in the products of which it has a large trade, and has flour-mills, distilleries, oil-works and leather-works, manufactures soap, chemicals and liqueur, and is well known for its sarsanet and other fabrics.

Avignon (Avenio) was an important town of the Gallic tribe of the Cavares, and under the Romans one of the leading cities of Gallia Narbonensis. Severely harassed during the barbarian invasions and by the Saracens, it was, in later times, attached successively to the kingdoms of Poitiers and of Arles, and to the domains of the counts of Provence and of Toulouse and of Forcalquier. At the end of the 12th century it became a republic, but in 1226 was taken and dismantled by Louis VIII. as punishment for its support of the Albigenses, and in 1251 was forced to submit to the counts of Toulouse and Provence. In 1309 the city was chosen by Clement V. as his residence, and from that time till 1377 was the papal seat. In 1348 the city was sold by Joanna, countess of Provence, to Clement VI. After Gregory XI. had migrated to Rome, two antipopes, Clement VII. and Benedict XIII., resided at Avignon, from which the latter was expelled in 1408. The town remained in the possession of the popes, who governed it by means of legates, till its annexation by the National Assembly in 1791, though during this interval several kings of France made efforts to unite it with their dominions. In 1791 conflicts between the adherents of the Papacy and the Republicans led to much bloodshed. In 1815 Marshal Brune was assassinated in the town by the adherents of the royalist party. The bishopric, founded in the 3rd century, became an archdiocese in 1471. See Familiars Castrui; Historia della città d’Avignone e del Contado Venesino (Venice, 1678); J. B. Joudou, Histoire des souverains pontifes qui ont siege à Avignon (Avignon, 1855); A. Canon, Guide de l’étranger dans la ville d’Avignon et ses environs (Avignon, 1858); J. F. André, Histoire de la Papauté d’Avignon (Avignon, 1887).

ÁVILA, GIL GONZALEZ DE (c. 1577-1658). Spanish biographer and antiquary, was born and died at Ávila. He was made historiographer of Castile in 1612, and of the Indies in 1641. Of his numerous works, the most valuable are his Teatro de los Grandees de Madrid (Madrid, 1625, sqq.), and his Teatro Eclesiastico, descriptive of the metropolitan churches and

cathedrals of Castile, with lives of the prelates (Madrid, 1645-1653, 4to., pts. 48). ÁVILA, a province of central Spain, one of the modern divisions of the kingdom of Old Castile; bounded on the N. by Valladolid, E. by Segovia and Madrid, S. by Toledo and Caceres, and W. by Salamanca. Pop. (1900) 200,457; area, 2,570 sq. m. Ávila is naturally divided into two sections, differing completely in soil, climate, productions and social economy. The northern portion is generally level; the soil is of indifferent quality, strong and marly in a few places, but rocky in all the valleys of the Sierra de Ávila; and the climate alternates from severe cold in winter to extreme heat in summer. The population of this part is mainly agricultural. The southern division is one mass of rugged granitic sierras, interspersed, however, with sheltered and well-watered valleys, abounding with rich vegetation. The winter here, especially in the elevated region of the Paramera and the waste lands of Ávila, is long and severe, but the climate is not unhealthy. In this region stock-breeding is an important industry. The principal mountain chains are the Guadarrama, separating this province from Madrid; the Paramera and Sierra de Ávila, west of the Guadarrama; and the vast wall of the Sierra de Gredos along the southern frontier, where its outstanding peaks rise to 6000 or even 8000 ft. The largest town in the province is Ávila, founded in the late 9th century and connected by the Royal Road to the Guadalquivir. Apart from Ávila there are no important towns. The principal production is the wool of the merino sheep, which at one time yielded an immense revenue. Game is plentiful, and the rivers abound in fish, especially trout. Olives, chestnuts and grapes are grown, and silk-worms are kept. There is little trade, and the manufactures are few, consisting chiefly of copper utensils, lime, soap, cloth, paper and combs. The state of elementary education is comparatively good, rather more than two-thirds of the population being able to read and write, and the ratio of crime is proportionately low.

ÁVILA (anc. Abula or Avela), the capital of the province described above; on the right bank of the river Adaja, 54 m. W. by N. of Madrid, by the Madrid-Valladolid railway. Pop. (1900) 11,885. The city is built on the flat summit of a rocky hill, which rises abruptly in the midst of a veritable wilderness; a brown, arid, treeless table-land, strewn with immense grey boulders, and shut in by lofty mountains. The ancient walls of Ávila, constructed of brown granite, and surmounted by a crenellated crest, with eighty-seven towers and nine gateways, are still in excellent condition, but a large part of the city lies beyond their circuit. Ávila is the seat of a bishop, and contains several ecclesiastical buildings of high interest. The Gothic cathedral, said by tradition to date from 1107, but probably of 13th or 14th century workmanship, has the appearance of a fortress, with embattled walls and two solid towers. It contains many interesting sculptures and paintings, besides one especially fine silver pyx, the work of Juan de Arphe, dating from 1571. The churches of San Vicente, San Pedro, Santos Tomás and San
Segundo are, in their main features, Romanesque of the 15th century, although partly of the beautiful San Vicente, and of San Pedro, may be as old as the 13th century. Especially noteworthy is the marble monument in Santo Tomás, carved by the 15th-century Florentine sculptor Domenico Fancelli, over the tomb of Prince John (d. 1497), the only son of Ferdinand and Isabella. The convent and church of Santa Teresa mark the supposed birthplace of the saint whose name they bear (c. 1515-1522). Ávila also possesses an old Moorish castle (alcazar) used as barracks, a foundling hospital, infirmary, military academy, and training schools for teachers of both sexes. From 1482 to 1807 it was also a seat of a university. It has a considerable trade in agricultural products, leather, pottery, hats, linen and cotton goods.

For the local history see V. Picasto, Tradiciones de Ávila (Madrid, 1888); and L. Arix, Historia de las grandes de... Ávila (Akalé de Henares, 1907).

AVILA Y ZUNIGA—AVLONA

65

AVILA Y ZUNIGA, LUIS DE (c.1490—c. 1560), Spanish historian, was born at Placentia. He was probably of low origin, but married a wealthy heiress of the family of Zuniga, whose name he added to his own. He rose rapidly in the favour of the emperor Charles V., serving as ambassador to Rome, where he was master of ceremonies of the order of the Knights of Alcantara. He accompanied the emperor to Africa in 1541, and having served during the war of the league of Schmalkalden, wrote a history of this war entitled Commentarios de la guerra de Alemania, hecha de Carlos V en el año de 1540 y 1547. This was first printed in 1548, and becoming very popular was translated into French, Dutch, German, Italian and Latin. As may be expected from the author's intimacy with Charles, the book is very partial to the emperor, and its misrepresentations have been severely criticized.

AVILÉS, PEDRO MENÉNDEZ DE (1510—1574), Spanish seaman, founder of St Augustine, Florida, was born at Avilés in Asturias on the 15th of February 1510. His family were gentry, and he was one of nineteen brothers and sisters. At the age of fourteen he ran away to sea, and was engaged till he was thirty-four in a life of adventure as a corsair. In 1540 during peace between France and Spain he was commissioned by the emperor Charles V. to clear the north coast of Spain and the Canaries of French pirates. In 1554 he was appointed captain-general and governor of the island of Florida, and made governor of the Florida settlements. He was commissioned to carry into effect the famous treaty of September 1559, by which Spain and America. The appointment was made by the emperor over the head and against the will of the Casa de Contratación, or governing board of the American trade. In this year, and before he sailed to America, Avilés accompanied the prince of Spain, afterwards Philip II., to England, where lie had gone to marry Queen Mary. As commander of the flota he displayed a diligence, and achieved a degree of success in bringing back treasure, which earned him the hearty approval of the emperor. But his devotion to the imperial service, and his steady refusal to receive bribes as the reward for permitting breaches of the regulations, made him unpopular with the merchants, while his high-handed ways offended the Casa de Contratación. Re-appointed commander in 1557, and knowing the hostility of the Casa, he applied for service elsewhere. The war in which Spain and England were allies was then in progress, and until the close of 1559 ample occupation was found for Avilés in bringing money and recruits from Spain to Flanders. When peace was restored he commanded the fleet which brought Philip II. back to Spain, and he took command of the flota in 1560. He was again appointed to command the flota, and he made a most successful voyage to America and back, in that and the following year. His relations with the Casa de Contratación were, however, as strained as ever. On his return from another voyage in 1563 he was arrested by order of the Casa, and was detained in prison for twenty months. What the charges brought against him were is not known. Avilés in a letter to the king avows his innocence, and he was finally discharged by the judges, but not until they had received two peremptory orders from the king to come to a decision.

On his release he prepared to sail to the Bermudas to seek for his son Juan, who had been shipwrecked in the previous year. At that time the French Huguenots were engaged in endeavouring to plant a colony in Florida. As the country had been explored by the Spaniards they claimed it as theirs, and its position on the track of the home-coming trade of Mexico rendered its possession by any other power highly dangerous. Philip II. endeavoured to avert the peril by making an “asiento” or contract with Avilés, by which he advanced 15,000 ducats to the seaman, and constituted him proprietor of any colony which he could establish in Florida, on condition that the money was repaid. The contract was signed on the 20th of March 1565. Avilés sailed on the 28th of July of the same year with one vessel of 600 tons, ten sloops and 150 men. On the 28th of August he entered and named the Bay of St Augustine, and began a fort there. He took the French post of Fort Caroline on the 20th of September 1565, and in October exterminated a body of Frenchmen who, under the Huguenot Jean Ribault, had arrived on the coast of Florida to relieve their colony. The Spanish commander, after slaying nearly all his prisoners, hung their bodies on trees, with the inscription, “Not as Frenchmen but as Lutherans.” A French sea-captain named Dominique de Gourgues revenged the massacre by capturing in 1568 Fort San Mateo (as the Spanish had renamed Fort Caroline), and hanging the garrison, with the inscription, “Not as Spaniards but as murderers.” Till 1567 Avilés remained in Florida, busy with his colony. In that year he returned to Spain. He made one more voyage to Florida, and died on the 17th of September 1574. Avilés married Maria de Solis, when very young, and left three daughters. His letters prove him to have been a pious and high-minded officer, who never imagined that he could be supposed by any honest man to have gone too far in massacring the Frenchmen, whom he regarded as pirates and heretics.

See The Spanish Settlements within the Present Limits of the United States, 1565-1574, by Woodbury Lowery (New York, 1905).

AVILÉS, or S. NICOLÁS DE AVILÉS (the Roman Flavianio), a seaport of northern Spain, in the province of Oviedo; on the Bay of Avilés, a wining inlet of the Bay of Biscay, 24 m. by rail W. of Gijón. Pop. (1890) 12,763. Avilés is a picturesque and old-fashioned town, containing several ancient palaces and Gothic churches of great beauty, which are crossed by a fine bridge at its narrow landward extremity, is the head-quarters of a fishing fleet, and a port of call for many coasting vessels. Coal from the Oviedo mines is exported coastwise, and in 1904 the shipments from Avilés for the first time exceeded those from Gijón, reaching a total of more than 290,000 tons. Glass and coarse linen and woollen stuffs are manufactured; and there are valuable stone quarries in the neighbourhood.

AVIZANDUM (from Late Lat. aviare, to consider), a Scots law term; the judge “makes avizandum with a cause,” i.e. takes time to consider his judgment.

AVLONA (anc. Aulon; Ital. Valona; Alb. Vilona), a town and seaport of Albania, Turkey, in the vilayet of Iannina. Pop. (1900) about 6000. Avlona occupies an eminence near the Gulf of Avlona, an inlet of the Adriatic, almost surrounded by mountains. The port is the best on the Albanian coast, and the nearest to Italy. It is protected by the island of Saseno, the ancient Saso, and by Cape Glossa, the northermost headland of the Acrocorinian mountains. It is regularly visited by steamers from Trieste, Fiume, Brindisi, and other Austro-Hungarian and Italian ports, as well as by many small Greek and Turkish coasters. The cable and telegraph line from Otranto, in Italy, to Constantinople, has an important station here. The town is about 14 m. from the sea, and has rather a pleasant appearance with its minarets and its palace, surrounded with gardens and olive-groves. Valonia, a material largely used by tanners, is the pericarp of an acorn obtained in the neighbouring oakwoods, and derives its name from Valona. The surrounding district is mainly agricultural and pastoral, producing oats, maize, cotton, olive oil, cattle, sheep, skins, hides and butter. All these commodities are exported in considerable quantities, besides bitumen, which is obtained from a mine worked by a French

III. 3
company. The imports are woolen and cotton piece-goods, metals and petroleum.

Avona played an important part in the wars between the Normans and the Byzantines, during the 11th and 12th centuries. In 1464 it was taken by the Ottomans; and after being in Venetian possession in 1690, was restored to them in 1691. In 1851 it suffered severely from an earthquake.

AVOCA, or Ovoca, VALE OF, a mountain glen of county Wicklow, Ireland, in the south-eastern part of the county, formed by the junction of the small rivers Avonmore and Avon-
beag, which, rising in the central highlands of the county, form with their united waters the Ovoca river, flowing south and south-east to the Irish Sea at Arklow. The vale would doubtless rank only as one among the many beautiful glens of the district, but that it has obtained a lasting celebrity through one of the Irish Melodies of the poet Thomas Moore, in which its praises are sung. It is through this song that the term “Avoca” is most familiar, although the name is locally spelt “Ovoca.” The glen is narrow and densely wooded. Its beauty is somewhat marred by the presence of lead and copper mines, and by the main line of the Dublin & South Eastern railway, on which Ovoca, or Avona, is a station. Of the two “meetings of the waters” (the upper, of the Avonmore and Avonbeg, and the lower, of the Aughrim with the Ovoca) the upper, near the fine seat of Castle Kishward, is that which inspired the poet. At Avondale, above the upper “meeting,” by the Avonmore, Charles Stewart Parnell was born.

AVOCADO PEAR, the fruit of the tree Persea gratissima, which grows in the West Indies and elsewhere; the flesh is of a soft and buttery consistency and highly esteemed. The name avocado, the Spanish for “advocate,” is a sound-substitute for the Aztec ahucaad; it is also corrupted into “alligator-pear.” Avocado, avigato, abobada are varieties.

AVOGADRO, AMEDEO, CONTE DI QUIRRA (1776-1856), Italian physicist, was born at Turin on the 9th of June 1776, and died there on the 9th of July 1856. He was for many years professor of higher physics in Turin University. He published many physical memoirs on electricity, the dilatation of liquids by heat, specific heats, capillary attraction, atomic volumes &c. as well as a treatise in 4 volumes on Fisica di corpi ponderabili (1837-1841). But he is chiefly remembered for his “Essai d’une manière de déterminer les masses relatives des molécules élémentaires des corps, et les proportions selon lesquelles elles entrent dans les combinaisons” (Journ. de Phys., 1811), in which he enunciated the hypothesis known by his name (Avogadro’s rule) that under the same conditions of temperature and pressure equal volumes of all gases contain the same number of smallest particles or molecules, whether those particles consist of single atoms or are composed of two or more atoms of the same or different kinds.

AVOIDANCE (from “avoid”) properly to make empty or void, in current usage, to keep away from, to shun; the word “avoid” is adapted from the O. Fr. esveider or évider, to empty out, void of contents, midway in the val. is 43 g. south of Dublin. Of the two “meetings of the waters” (the upper, of the Avonmore and Avonbeg, and the lower, of the Aughrim with the Ovoca) the upper, near the fine seat of Castle Kishward, is that which inspired the poet. At Avondale, above the upper “meeting,” by the Avonmore, Charles Stewart Parnell was born.

AVOIDUPOIS, or AVERDUPOIS (from the French a voir de pois, goods of weight), the name of a system of weights used in Great Britain and America for all commodities except the precious metals, gems and medicines. The foundation of the system is the grain. A cubic inch of water weighs 252.458 grains. Of this grain 7000 now (see Weights and Measures) make a pound avoirdupois. This pound is divided into 16 oz., and these ounces into 16 drachms.

Avoirdupois Weight.

Drachm, 16=ounce; 16=pound, 14=stone, 2=quarter, 4=halfton, 20=ton.

127.2 grains 437.5 7000 58,000 10,600,000 grs. 112 lb 2240 lb.

AVOIRDUPOIS, the name of several rivers in England and elsewhere.

AVON, the name of several rivers in England and elsewhere. The word is Celtic, appearing in Welsh (very frequently) as afon, in Manx as oon, and in Gaelic as obhaimh (pronounced avain), and is radically identical with the Sanskrit ap and the Lat. aqua and avmis. The root appears more or less disguised in a vast number of river names all over the Celtic area in Europe. Thus, besides such forms as Even, Aven, Aune, Ivo, Avney, Ikey, &c., in the British Islands, Afi, Aven, Avon, Aune appear in Brittany and elsewhere in France, Avena and Aven in Italy, Avis in Portugal, and Avento in Spain; while the terminal syllable of a large proportion of the Latinized names of French rivers, such as the Sequana, the Matrona and the Garumna, seems originally to have been the same word. The names Punjab, Dooeb, &c., show the root in a clearer shape.

In England the following are the principal rivers of this name.

1. The East or HAMPSHIRE AVON rises in Wiltshire south of Marlborough, and watering the Vale of Pewsey collects feeders from the high downs between Marlborough and Devizes. Breaching the high ground of Salisbury Plain, it passes Amesbury, and following a very sinuous course reaches Salisbury. Here it receives on the east bank the waters of the Bourne, and on the left, the waters of the Wilt. In widening, fertile valley it continues past Devizes, Fording-
bridge and Ringwood, skirting the New Forest on the west, to Christchurch, where it receives the Stour from the west, and 2½ m. lower enters the English Channel through the broad but narrow-
mouthed Christchurch harbour. The length, excluding lesser sinuosities, is about 60 m., Salisbury being 35 m. above the mouth. The total fall is rather over 500 ft, and that from Salisbury about 140 ft. The river is of no commercial value for navigation. It abounds in fish, and there are valuable salmon fisheries. The drainage area is 1132 sq. m.

2. The LOWER or BRISTOL AVON rises on the eastern slope of the Cotswold Hills in Gloucestershire, collecting the waters of several streams south of Tetedbury and east of Malmsbury. It flows east and south in a wide curve, through a broad upper valley past Chippenham and Melksham, after which it turns abruptly west to Bradford-on-Avon, receives the waters of the Frome from the south, and enters the beautiful narrow valley in which lie Bath and Bristol. Below Bristol the valley becomes the Clifton Gorge, famous for its wooded cliffs and for the Clifton (q.v.) suspension bridge which bristles it. The cliffs and woods have been so far disfigured by quarries that public feeling was aroused, and in 1904 an “Avon Gorge Committee” was appointed to report to the corporation of Bristol on the possibility of preserving the beauties of the locality. The Avon finally enters the estuary of the Severn at Avonmouth, though it can hardly be reckoned as a tributary of that river. From Bristol downward the river is one of the most important commercial waterways in England, as giving access to that great port. The Kennet and Avon Canal, between Reading and the Avon, follows the river closely from Bradford down to Bath, where it enters it by a descent of seven locks. The length of the river, excluding minor sinuosities, is about 75 m., the distance from Malmesbury to Bath being 10 m., thence to Bristol 12 m., and thence to the mouth 8 m. The total fall is between 500 and 600 ft, but it is only 235 ft. from Malmsbury. The drainage area is 891 sq. miles.

3. The UPPER AVON, also called the Warwickshire, and sometimes the “Shakespeare” Avon from its associations with the poet’s town of Stratford on its banks, is an eastern tributary of the Severn. It rises near Naseby in Northamptonshire, and, with a course of about 100 m. joins the Severn immediately below Tewkesbury in Gloucestershire. Its early course is south-westernly to Rugby, thereinafter it runs west and south-west to Warwick, receiving the Leam on the east. Its general direction thereafter remains south-western, and it flows past Stratford-on-Avon, receives the Stour on the south and the Arrow on the north and thence past Evesham and Pershore to Tewkesbury. The valley is always broad, and especially from Warwick downward, through the Vale of Evesham, the scenery is very beautiful, the rich valley being flanked by the bold Cotswold Hills on
the south and by the wooded slopes of the Ardennes district of
Warwickshire on the north. The view of Warwick Castle, rising
from the wooded banks of the river, is unsurpassed, and the
positions of Stratford and Evesham are admirable. The river is
locked, and carries a small trade up to Evesham, 28 m. from
Tewkesbury; the locks from Evesham upward to Stratford
(17 m.) are decayed, but the weirs, and mill-dams still higher,
aflord many navigable reaches to pleasure boats. The total
fall of the river is about 250 ft.; from Rugby about 235 ft., and
from Warwick 120 ft. The river abounds in coarse fish.

Among other occurrences of the name of Avon in Great Britain
there may be noted—in England, a stream flowing south-east
from Dartmoor in Devonshire to the English Channel; in
South Wales, the stream which has its mouth at Aberavon in
Glamorganshire; in Scotland, tributaries of the Clyde, the Spey
and the Forth.

**AVONIAN**, in geology, the name proposed by Dr A. Vaughan
in 1905 (Q.J.G.S. vol. lxi. p. 264) for the rocks of Lower
Carboniferous age in the Avon gorge at Bristol. The Avonian
stage appears to embrace precisely the same rocks and fossil-
zones as the earlier designation "Dinantian" (see Carbonifer-
ous System); but its sub-stages, being founded upon different
local conditions and a different interpretation of the zonal fossils,
do not correspond exactly with those of the French and Belgian
geologists.

The upper Avonian (Kidwellian) is well developed about
Kidwelly in Carmarthenshire. The lower substage (Clevedonian)
is well displayed near Clevedon in Somerset.

vol. i., pt. 2, 1906, pp. 74-168 (many plates); and T. F. Sibley, "On
the Carboniferous Limestone (Avonian) of the Mendips and
(J. A. H.)

**AVONMORE, BARRY YELVERTON, 1ST VISCOUNT** (1756—
1803), Irish judge, was born in 1736. He was the eldest son of
Frank Yelverton of Blackwater Co. Cork. Educated at Trinity
College, Dublin, he was for some years an assistant master under
Andrew Buck in the Hibernian Academy. In 1761 he married
Miss Mary Nugent, a lady of some fortune, and was then enabled
to read for the bar. He was called in 1764, his success was rapid,
and he took silk eight years afterwards. He sat in the Irish
parliament as member successively for the boroughs of Donegal
and Carrickfergus, becoming attorney-general in 1782, but was
elevated to the bench as chief baron of the exchequer in 1783.
He was created (Irish) Baron Avonmore in 1795, and in 1800
(Irish) viscount. Among his colleagues at the Irish bar Yelver-
ton was a popular and charming companion. Of inscrutable
appearance, he owed his early successes to his remarkable
elocution, which made a great impression on his contemporaries;
as a judge, he was inclined to take the view of the advocate
rather than that of the impartial lawyer. He gave his support to
Grattan and the Whigs during the greater part of his parlia-
mentary career, but in his latter days became identified with the
court party and voted for the union, for which his viscountcy was
a reward. He had three sons and one daughter, and the title
has descended in the family.

**AVRANCHES**, a town of north-western France, capital of an
arrondissement in the department of Manche, 87 m. S. of
Cherbourg on the Western railway. Pop. (1906) 7186. It stands
on a wooded hill, its botanical gardens commanding a fine view
westward of the bay and rock of St Michel. At the foot of the
hill flows the river Sée, which at high tide is navigable from
the sea. The town is surrounded by avenues, which occupy the site
of the ancient ramparts, remains of which are to be seen on the
north side. Avranches was from 511 to 1790 a bishop's see, held
at the end of the 17th century by the scholar Daniel Huet; and its

**cathedral**, destroyed as insecure in the time of the first French
Revolution, was the finest in Normandy. Its site is now occupied
by an open square, one stone remaining to mark the spot where
Henry II. of England received absolution for the murder of
Thomas Becket. The churches of Notre-Dame des Champs and
St Saturnin are modern buildings in the Gothic style. The ancient
episcopal palace is now used as a court of justice; a public
library is kept in the hôtel de ville. In the public gardens
there is a statue of General Jean Marie Valhubert, killed at
Austeritz. Avranches is seat of a sub-prefect and has a tribunal
of first instance and a communal college. Leather-dressing is
the chief industry; steam-sawing, brewing and dyeing are also
carried on, and horticulture flourishes in the environs. Trade is
in cider, cattle, butter, flowers and fruit, and there are salmon
and other fisheries.

Avranches, an important military station of the Romans,
was in the middle ages chief place of a county of the duchy of
Normandy. It sustained several sieges, the most noteworthy
of which, in 1591, was the result of its opposition to Henry IV.
In 1639 Avranches was the focus of the peasant revolt against
the salt-tax, known as the revolt of the Nu-pieds.

**AWADIA and FADNIA**, two small nomad tribes of pure Arab
blood living in the Bayuda desert, Anglo-Egyptian Sudan. Their
cultures are similar to those of the Semnones, &c., but they are
often incorrectly classed as Ja'alin. They own numbers of horses
and cattle, the former of the black Dongola breed. At the battle
of Abu Klea (17th of January 1885) they were conspicuous for
their courage in riding against the British square.

See Anglo-Egyptian Sudan, edited by Count Gleichen (London,
1905).

**AWAJI**, an island belonging to Japan, situated at the eastern
entrance of the Inland Sea, having a length of 32 m., an extreme
breadth of 16 m., and an area of 218 sq. m., with a population
of about 100,000. It is separated on the south from the island
of Shikoku by the Naruto channel, through which, in certain
conditions of the tide, a remarkable torrential current is set up.
The island is celebrated for its exquisite scenery, and also for
the fact that it is traditionally reputed to have been the first
of the Japanese islands created by the deities Izanagi and
Izanami. The loftiest peak is Yuruuba-yama (1908 ft.), the most
picturesque Senzan (1510 ft.). Awaji is noted for a peculiar
manufacture of pottery.

**AWARD** (Law. award, or espurt, cf. "reward"), the
decision of an arbitrator. (See Arbitration.)

**AWE, LOCH** (see Argyllshire), the longest freshwater
lake in Scotland, situated in mid-Arryglshire, 116 ft. above the sea,
with an area of nearly 16 sq. m. It has a N.E. to S.W. direction and
is fully 23 m. long from Kilchurn Castle to Ford, its breadth varying
from ½ to 3 m. at its upper end, where it takes the shape of a
crescent, one arm of which runs towards Glen Orchy, the other
to the point where the river Awe leaves the lake. The two ends
of the loch are wholly dissimilar in character, the scenery of the
upper extremity being majestic, while that of the lower half
is pastoral and tame. Of its numerous islands the best-known
is Inshail, containing ruins of a church and convent, which
was suppressed at the Reformation. At the extreme north-eastern
end of the lake, on an islet which, when the water is low,
becomes part of the mainland, stand the imposing ruins of Kil-
churn Castle. Its romantic surroundings have made this castle
a favourite subject of the landscape painter. Dalmally, about
2 m. from the loch, is one of the pleasantest villages in the
Highlands and has a great vogue in midsummer. The river Awe,
issuing from the north-western horn of the loch, affords excellent
trout and salmon fishing.

**AWL** (O. Eng. awl; at one time spelt nawl by a confusion
with the indefinite article before it), a small hand-tool for piercing
holes.

**AXE** (O. Eng. aoe; a word common, in different forms,
in the Teutonic languages, and akin to the Greek ἀξία; the
New English Dictionary prefers the spelling "ax"), a tool or
weapon, taking various shapes, but, when not compounded with
some distinguishing word (e.g. in "pick-axe"), generally formed
by an edged head fixed upon a handle for striking. A “hatchet” is a small sort of axe.

AXHOLME, an island in the north-west part of Lincolnshire, England, lying between the rivers Trent, Idle and Don, and isolated by drainage channels connected with these rivers. It consists mainly of a plateau of slight elevation, rarely exceeding 100 ft., and comprises the parishes of Althorpe, Belton, Epworth, Haxey, Luddington, Owston and Crowle; the total area being about 47,000 acres. At a very early period it would appear to have been covered with forest; but this having been in great measure destroyed, it became in great part a swamp. In 1627 King Charles I., who was lord of the island, entered into a contract with Cornelius Vermuyen, a Dutchman, for reclaiming the mires and marshes, and rendering them fit for tillage. This undertaking led to the introduction of a large number of Flemish workmen, who settled in the district, and, in spite of the violent measures adopted by the English peasantry to expel them, retained their ground in sufficient numbers to affect the physical appearance and the accent of the inhabitants to this day. The principal towns in the isle are Crowle (pop. 1769) and Epworth. The Axholme joint light railway runs north and south through the isle, connecting Goole with Haxey junction; and the Great Northern, Great Eastern and Great Central lines also afford communications. The land is extremely fertile. The name, properly Axeyholve (cf. Haxey), is hybrid, Ax being the Celtic word, water; ey the Anglo-Saxon for island; and holm the Norse word with the same signification.

AXILE, or AXIAL, a term (= related to the axis) used technically in science; in botany an embryo is called axile when it has the same direction as the axis of the seed.

AXINITE, a mineral consisting of a complex aluminium and calcium borosilicate with a small amount of basic hydrogen; the calcium is partly replaced in varying amounts by ferrous iron and manganese, and the aluminium by ferric iron: the formula is \( \text{HC}_8\text{Al}_4\text{Si}_5\text{O}_{16} \). The mineral was named (from \( \text{a} \text{g} \text{i} \text{n} \text{i} \text{t} \) an axe) by R. J. Hatry in 1799, on account of the characteristic thin wedge-like form of its anorthic crystals. The colour is usually brown, but rarely it has a violet tinge (on this account the mineral was named yaginite, meaning violet stone, by J. C. Delamétherie in 1792). The best specimens are afforded by the beautifully developed transparent glassy crystals, found with albite, prehnite, and quartz, in a zone of amphibolite and chlorite-schists at Le Bourg d’Oisans in Dauphiné. It is found in the greenstone and hornblende-schists of Batallack Head near St Just in Cornwal, and in diabase in the Harz; and small ones in Maine and in Northampton county, Pennsylvania, U.S.A. Large crystals have also been found in Japan. In its occurrence in basic rather than in acid eruptive rocks, axinite differs from the borosilicate tourmaline, which is usually found in granite. The specific gravity is 3-28. The hardness of 6½-7, combined with the colour and transparency, renders axinite applicable for use as a gem-stone, the Dauphiné crystals being occasionally cut for this purpose.

AXIS (L. J. S.)

AXIOM (Gr. \( \alpha \xi α i o \), a general proposition on a principle accepted as self-evident, either absolutely or within a particular sphere of thought. Each special science has its own axioms (cf. the Aristotelian \( \alpha χ \), "first principles") which, however, are sometimes susceptible of proof in another wider science. The Greek word was probably confined by Plato to mathematical axioms, but Aristotle (Anal. Post. i. 2) gave it also the wider significance of the ultimate principles of thought which are behind all special sciences (e.g. the principle of contradiction). These are apprehended solely by the mind, which may, however, be led to them by an inductive process. After Aristotle, the term was used by the Stoics and the school of Ramus for a proposition simply, and Bacon (Nov. Organ. i. 7) used it of any general proposition. The word was reintroduced in modern philosophy probably by René Descartes (or by his followers) who, in the search for a definite self-evident principle as the basis of a new philosophy, naturally turned to the familiar science of mathematics. The axiom of Cartesianism is, therefore, the Cogito ergo sum. Kant still further narrowed the meaning to include only self-evident (intuitive) synthetic propositions, i.e. of space and time. The nature of axiomatic certainty is part of the fundamental problem of logic and metaphysics. Those who deny the possibility of all non-empirical knowledge naturally hold that every axiom is ultimately based on observation. For the Euclidian axioms see GEOMETRY.

AXIS (in Mid. Eng. axel-ere, from O. Norweg. øxul-tere, cognate with the O. Eng. axe or eaxe, and connected with Sansk. अक्ष, Gr. \( \alpha \xi ω \), and Lat. axiis), the pin or spindle on which something revolves. In carriages the axle-ter is the bar on which the wheels are revolving. In a pulley system its diameter or radius is extended through the middle of the pulley and joins the radius of the sprocket-wheel such that the two radii turn in opposite directions. The pins which pass through the ends of the axles and keep the wheels from slipping off are known as axle-pins or "linch-pins," "linch" being a corruptions, due to confusion with "link," of the Old English word for "axle," lynes, cf. Ger. Länze.

AX - LES - THERMS, a watering place of south-western France, in the department of Ariège, at the confluence of the Ariège with three tributaries, 26 m. S.S.E. of Foix by rail. Pop. (1906) 1179. Ax (Aqua), situated at a height of 2300 ft., is well known for its warm sulphur springs (77°-172° F.), of which there are about sixty. The waters, which were used by the Romans, are efficacious in the treatment of rheumatism, skin diseases and other maladies.

AXMINSTER, a market-town in the Honiton parliamentary division of Devonshire, England, on the river Axe, 27 m. E. by N. of Exeter by the London & South-Western railway. Pop. (1901) 2968. The manor, dedicated to St. Mary the Virgin, in every style of architecture, from Norman to Perpendicular. There are in the chancel two freestone effigies, perhaps of the 14th century, besides three sedilia, and a piscina under arches. Axminster was long celebrated for the admirable quality of its carpets, which were woven by hand, like tapestry. Their manufacture was established in 1755. Their name is preserved, but since the seat of this industry was removed to Wilton near Salisbury, the inhabitants of Axminster have found employment in brush factories, corn mills, timber yards and an iron foundry. Cloth, drugget, cotton, leather, gloves and tapes are also made. Coxdon House, the birthplace in 1602 of Sir Symonds d’Ewes, the Puritan historian, is about 2 m. distant, and was formerly known as St Calyst.

Axminster (Axemystre) derives its name from the river Axe and from the prebend of Axen, which is said to have been given to the King Ethelstan. The situation of Axminster at the intersection of the two great ancient roads, Ikiid Street and the Fosse Way, and also the numerous earthworks and hill-fortresses in the neighbourhood indicate a very early settlement. There is a tradition that the battle of Brunanburh was fought in the valley of the Axe, and that the bodies of the Danish princes who perished in action were buried in Axminster church. According to Domesday, Axminster was held by the king. In 1246 Reginald de Mohun, then lord of the manor, founded a Benedictine abbey at Newenham within the parish of Axminster, granting it a Saturday market and a fair on Midsummer day, and the next year made over to the monks from Beaulieu the manor and hundred of Axminster. The abbey was dissolved in 1539. The midsummer fair established by Reginald de Mohun is still held.

See Victoria County History—Devon; James Davidson, British and Roman Remains in the Vicinity of Axminster (London, 1833).

AXOLOTL, the Mexican name given to larave salamanders of the genus Amblystoma. It required the extraordinary acumen of the great Cuvier at once to recognize, when the first specimens
of the *Cyprinus edulis* or *Axolotl* of Mexico were brought to him by Humboldt in the beginning of the 19th century, that these Batrachians were not really related to the Perennibranchiates, such as *Siren* and *Proteus*, with which he was well acquainted, but represented the larval form of some air-breathing salamander. Little heed was paid to his opinion by most systematists, and when, more than half a century later, the axolotl was found to breed in its branchier condition, the question seemed to be settled once for all against him, and the genus *Sireodon*, as it was called by J. Wagler, was unanimously maintained and placed among the permanent gill-breathers.

It seemed impossible to admit that an animal which lives for years without losing its gills, and is able to propagate in that state, could be anything but a perfect form. And yet subsequent discoveries, which followed in rapid succession, have established that *Sireodon* is but the larval form of the salamander *Amblystoma*, a genus long known from various parts of North America; and Cuvier’s conclusions now read much better than they did half a century after they were published. Before reviewing the history of these discoveries, it is desirable to say a few words of the characters of the axolotl (larval form) and of the *Amblystoma* (perfect or imago form).

The axolotl has been known to the Mexicans from the remotest times, as an article of food regularly brought from neighbouring lakes to the Mexico market, its flesh being agreeable and wholesome. Francisco Hernandez (1514-1578) has alluded to it as *Cyprinus edulis* or *stolotlal*, and as *lusus aquaticus, piscis ludicrum, or axolotl*, which latter name has remained in use, in Mexico and elsewhere, to the present day. But for its large size—it grows to a length of eleven inches—it is a nearly exact image of the British newt larvae. It has the same moderately long, plump body, with a low dorsal crest, the continuation of the membrane bordering the strongly compressed tail; a large thick head with small eyes without lids and with a large pendent upper lip; two pairs of well-developed limbs, with free digits; and above all, as the most characteristic feature, three large appendages on each side of the back of the head, fringed with filaments which, in their fullest development, remind one of black ostrich feathers. These are the external gills, through which the animal breathes the oxygen dissolved in the water. The jaws are provided with small teeth in several rows, and there is an elongate patch of further teeth on each side of the front of the palate (inserted on the vomerine and palatine bones). The colour is blackish, or of a dark olive-grey or brownish grey with round black spots or dots.

The genus *Amblystoma* was established by J. J. Tschudi in 1838 for various salamanders from North America, which had previously been described as *Lacerta* or *Salamandra*, and which, so far as general appearance is concerned, differ little from the European salamanders. The body is smooth and shiny, with vertical grooves on the sides, the tail is but feebly compressed, the eye is moderately large and provided with movable lids, and the upper lip is nearly straight. But the dentition of the palate is very different; the small teeth, which are in a single row, are arranged in transverse, continuous or interrupted series behind the inner nares or choanae. The animal leaves the water after completing its metamorphosis, the last stage of which is marked by the loss of the gills. One of the largest and most widely distributed species of this genus, which includes about twenty, is the *Amblystoma tigrinum*, an inhabitant of both the east and west of the United States and of a considerable part of the cooler parts of Mexico. It varies much in colour, but it may be described as usually brown or blackish, with more or less numerous yellow spots, sometimes arranged in transverse bands. It rarely exceeds a length of nine inches. This is the *Amblystoma* into which the axolotl has been ascertainment to transform. It is generally admitted that the axolotls which were kept alive in Europe and were particularly abundant between 1870 and 1880 are all the descendants of a stock bred in Paris and distributed chiefly by dealers, originally, we believe, by the late P. Carbonier. Close inbreeding without the infusion of new blood is probably the cause of the decrease in their numbers at the present day, specimens being more difficult to procure and fetching much higher prices than they did formerly, at least in England and in France.

The original axolotls, from the vicinity of Mexico City, it is believed, arrived at the Jardin d’Acclimatation, Paris, late in 1863. They were thirty-four in number, among which was an albino, and had been sent to that institution, together with a few other animals, by order of Marshal Forey, who was appointed commander-in-chief of the French expeditionary force to Mexico after the defeat of General Lorencez at Puebla (May 5th, 1862), and returned to France at the end of 1863, after having handed over the command to Marshal (then General) Bazaine. Six specimens (five males and one female) were given by the Société d’Acclimatation to Professor A. Duménil, the administrator of the reptile collection of the Jardin des Plantes, the living specimens of which were at that time housed in a very miserable structure, situated at a short distance from the comparatively sumptuous building which was erected some years later and opened to the public in 1874. Soon after their arrival at the Jardin d’Acclimatation, some of the axolotls spawned, but the eggs, not having been removed from the aquarium, were devoured by its occupants. At the same time, in the Jardin des Plantes, the single female axolotl also spawned, twice in succession, and a large number of young were successfully reared. This, it then seemed, solved the often-discussed question of the perennibranchiate nature of these Batrachians. But a year later, the second generation having reached sexual maturity, new broods were produced, and out of these some individuals lost their gills and dorsal crest, developed movable eyelids, changed their dentition, and assumed yellow spots,—in fact, took on all the characters of *Amblystoma tigrinum*. However, these transformed salamanders, of which twenty-nine were obtained from 1865 to 1870, did not breed, although their branchiate brethren continued to do so very freely. It was not until 1876 that the axolotl in its *Amblystoma* state, offspring of several generations of perennibranchiates, was first observed to spawn, and this again took place in the reptile house of the Jardin des Plantes, as reported by Professor E. Blanchard.

The original six specimens received in 1864 at the Jardin des Plantes, which had been carefully kept apart from their progeny, remained in the branchiate condition, and bred eleven times from 1865 to 1868, and, after a period of two years’ rest, again in 1870. According to the report of Aug. Duménil, they and their offspring gave birth to 9000 or 10,000 larvae during that period. So numerous were the axolotls that the Paris Museum was able to distribute to other institutions, as well as to dealers and private individuals, over a thousand examples, which found their way to all parts of Europe, and numberless specimens have been kept in England from 1866 to the present day. The first specimens exhibited in the London Zoological Gardens, in August 1864, were probably part of the original stock received from Mexico by the Société d’Acclimatation, but do not appear to have bred.

The axolotls, albinos of a pale flesh colour, with beautiful red gills, have also been kept in great numbers in England and on the continent. They are said to be all descendants of one albino male specimen received in the Paris Museum menagerie in 1866, which, paired with normal specimens in 1867 and 1868, produced numerous white offspring, which by selection have been fixed as a permanent race, without, according to L. Vaillant, showing any tendency to reversion. We are not aware of any but two of these albinos having ever turned into the perfect *Amblystoma* form, as happened in Paris in 1870, the albimism being retained.

Thus we see that in our aquariums most of the axolotls remain in the branchiate condition, transformed Individuals being on the whole very exceptional. Now it has been stated that in the lakes near Mexico City, where it was first discovered, the axolotl never transforms into an *Amblystoma*. This the present writer is inclined to doubt, considering that he has received examples of the normal *Amblystoma tigrinum* from various parts of Mexico, and that Alfred Dugès has described an *Amblystoma* from mountains near Mexico City; at the same time he feels very
suspicious of the various statements to that effect which have appeared in so many works, and rather disposed to make light of the ingenious theories launched by biological speculators who have never set foot in Mexico, especially those based on the dismal condition of the salt-encrusted surroundings which were supposed to have hemmed in the axolotl—the brackish Lago de Texcoco, the largest of the lakes near Mexico, being evidently in the philosopher’s mind.

Thanks to the enthusiasm of H. Gadow during his visit to Mexico in the summer of 1902, we are now better informed on the conditions under which the axolotl lives near Mexico City. First, he ascertained that there are no axolotls at all in the Lago de Texcoco, thus disposing at once of the Weismannian explanation; secondly, he confirmed A. Dugès’s statement that there is a second species of Amblystoma, which is normal in its metamorphosis, near Mexico but at a higher altitude, which may explain Velasco’s observation that regularly transforming Amblystomas occur near that city; and thirdly, he made a careful examination of the two lakes, Chalco and Xochimilco, where the axolotls occur in abundance and are procured for the market. The following is an abstract of Gadow’s very interesting account: “Lakes Chalco and Xochimilco are a paradise, situated about 10 ft. higher than the Texcoco Lake and separated from it by several hills. High mountains slope down to the southern shores, with a belt of fertile pastures, with shrubs and trees and little streams, here and there with rocks and ravines. In fact, there are thousands of enticing opportunities for news to leave the lake if they want to do so. Lake Xochimilco contains powerful springs, but away from them the water appears dark and muddy, full of suspended fresh and decomposing vegetable matter, teeming with fish, larvae of insects, Daphniae, worms and axolotl. These breed in the beginning of February. The native fishermen know all about them; how the eggs are fastened to the water plants, how soon after the little larvae swarm about in thousands, how fast they grow, until by the month of June they are all grown into big, fat creatures ready for the market; later in the summer the axolotls are said to take to the rushes, in the autumn they become scarce, but none have ever been known to leave the water or to metamorphose, nor are any perfect Amblystoms found in the vicinity of the two lakes.”

In Gadow’s opinion, the reason why there are only perennibranchiate axolotls in these lakes is obvious. The constant abundance of food, stable amount of water, innumerable hiding-places in the mud, under the banks, amongst the reeds and roots of the floating islands which are scattered all over them—all these points are inducements or attractions so great that the creatures remain in their paradise and consequently retain all those larval features which are not directly connected with sexual maturity. There is nothing which ever prevents them from leaving these lakes, but there is also nothing to induce them to do so. The same applies occasionally to European larvae, as in the case observed in the Italian Alps by F. de Filippi. Nevertheless, in the axolotl the latent tendency can still be revived, as we have seen above and as is proved by the experiments of Marie von Chauvin. When once sexually ripe the axolotl are apparently incapable of changing, but their ancestral course of evolution is still latent in them, and will, if favoured by circumstances, reappear in following generations.

AZUM, or AXUM, an ancient city in the province of Tigré, Abyssinia (4° 34’ to 3° 31’ E., altitude, 7226 ft.), 12 m. W. by S. of Adowa. Many European explorers have given descriptions of its monuments, though none of them has stayed there more than a few days. The name, written Aksum and Axum in the Sabaean and Ethiopic inscriptions in the place, is found in classical and early Christian writers in the forms of Axoume, Axumis, Axume, &c., the first mention being in the Periphrasis Maris Erythraei (c. a.d. 67), where it is said to be the seat of a kingdom, and the emporium for the ivory brought from the west. For the history of this kingdom see Ethiopia. J. T. Bent conjectured that the seat of government was transferred to Axum from Jecha, which he identified with the ancient Ava; and according to a document quoted by Achille Rafray the third Christian monarch transferred it from Axum to Lalibela. This second transference probably took place very much later; in spite of it, the custom of crowning Abyssinian kings at Axum continued, and King John was crowned there as late as 1871 or 1872. A. B. Wyld conjectures that it had become unsuitable for a royal seat by having acquired the status of a sacred city, and thus affording sanctuary to criminals and political offenders, within the chief church and a considerable area round it, where there are various houses in which such persons can be lodged and entertained. This same sanctity makes it serve as a repository for goods of all sorts in times of danger, the chief church forming a sort of bank. The present town, containing less than a thousand houses, is supposed to occupy only a small portion of the area covered by the ancient city; it lies in a kloof or valley, but the old town must have been built on the western ridge rather than in the valley, as the traces of well-dressed stones are more numerous there than elsewhere.

Most of the antiquities of Axum still await excavation; those that have been discovered consist mainly of obelisks, of which about fifty are still standing, while many more are fallen. They form a consecutive series from rude unshewn stones to highly finished obelisks, of which the tallest still erect is 60 ft. in height, with 8 ft. 7 in. extreme front width; others that are fallen may have been taller. The highly finished monoliths are all representations of a many-storied castle, with an altar at the base of each. They appear to be connected with Semitic sun-worship, and are assigned by Bent to the same period as the temple at Baalbek, though some antiquarians would place them much earlier; the representation of a castle in a single stone seems to bear some relation to the idea worked out in the monolith churches of Lalibela described by Rafray. The fall of many of the monuments, according to Bent, was caused by the washing away of the foundations by the stream called Mai Shum, and indeed the native tradition states that “Gudert, queen of the Amhara,” when she visited Axum, destroyed the chief obelisk in this way by digging a trench from the river to its foundation. Others attribute it to religious fanaticism, or to the result of some barbaric invasion, such as Axum may have repeatedly endured before it was sacked by Mahomed Gran,ultan of Harrar, about 1535.

LITERATURE.—Classical references to Axum are collected by Pietschmann in Pauli’s Realencyclopaedie (2nd ed.); for the history as derived from the inscriptions see D. H. Müller, Appendix to Bent’s Sacred City of the Ethiopians (London, 1893), and E. G. Ritter, Die Götterinschriften in Arabien (Munich, 1895). For the antiquities, Bruce’s Travels (1790); Salt, in the Travels of Viscount Valentia (London, 1809), iii. 87-97 and 176-200; J. T. Bent, i.e., and A. B. Wyld, Modern Abyssinia (London, 1901). For geology, see, also, in the Zeitschrift der Gesellschaft für Erdkunde Berlin (1869), (D. S. M.).

AYE, AYE. The word “aye,” meaning always (and pronounced as in “day”), connected with Gr. aéi, always, and Lat. aevum, an age), is often spoken “ay,” and the New English Dictionary prefers this. “Aye,” meaning Yes (and pronounced almost like the word “eye”), though sometimes identified with “ya,” is probably the same word etymologically, though differentiated by usage; the form “ay” for this is also common, but inconvenient; at one time it was spelt simply I (e.g. in Michael Drayton’s Idea, 57; published in 1593).

AYACUCHO, a city and department of central Peru, formerly known as Guaman or Huamanga, renamed from the small plain of Ayacucho (Quichua, “corner of death”). This lies near the village of Quiuina, in an elevated valley 11,600 ft. above sea-level, where a decisive battle was fought between General Sucre and the Spanish viceroy La Serna in 1824, which resulted in the defeat of the latter and the independence of Peru. The city of Ayacucho, capital of the department of that name
and of the province of Guamanga, is situated on an elevated plateau, 8911 ft. above sea-level, between the western and central Cordilleras, and on the main road between Lima and Cusco, 394 m. from the former by way of Jauja. Pop. (1896) 20,000. It has an agreeable, temperate climate, is regularly built, and has considerable commercial importance. It is the seat of a bishopric and of a superior court of justice. It is distinguished for the number of its churches and conventual establishments, although the latter have been closed. The city was founded by Pizarro in 1539 and was known as Guamanga down to 1825. It has been the scene of many notable events in the history of Peru.

The department of Ayacucho extends across the great plateau of central Peru, between the departments of Huancavelica and Apurimac, with Cusco on the E. and Ica on the W. An area of 18,185 sq. m.; pop. (1896) 302,460. It is divided into six provinces, and covers a broken, mountainous region, partially barren in its higher elevations but traversed by deep, warm, fertile valleys. It formed a part of the original home of the Incas and once sustained a large population. It produces Indian corn and other cereals and potatoes in the colder regions, and tropical fruits, sweet potatoes and mandioca (Jatropha monoica, L.) in the warmer. It has a large number of silver mines in operation. Its name was changed from Guamanga to Ayacucho by a decree of 1825.

AYAH, a Spanish word (aya) for children’s nurse or maid, introduced by the Portuguese into India and adopted by the English to denote their native nurses.

AYALA, DON PEDRO LOPEZ DE (1732-1847), Spanish statesman, historian and poet, was born at Vitoria in 1732. He first came into prominence at the court of Peter the Cruel, whose cause he finally deserted; he greatly distinguished himself in subsequent campaigns, during which he was twice made prisoner, by the Black Prince at Najera (1367) and by the Portuguese at Aljubarrota (1385). A favourite of Henry II. and John I. of Castile, he was made grand chancellor of the realm by Henry III. in 1368. A brave officer and an able diplomat, Ayala was one of the most cultivated Spaniards of his time, at once historian, translator and poet. Of his many works the most important are his chronicles of the four kings of Castile during whose reigns he lived; they give a generally accurate account of scenes and persons which he had witnessed; he also wrote a long satirical and didactic poem, interesting as a picture of his personal experiences and of contemporary morality. The first part of his chronicle, covering only the reign of Peter the Cruel, was printed at Seville in 1495; the first complete edition was printed in 1779-1780 in the collection of Crónicas Españolas, under the auspices of the Spanish Royal Academy of History. Ayala died at Calahorra in 1407.

AYALA Y HERRERA, ADELARDO LOPEZ DE (1828-1879), Spanish writer and politician, was born at Guadalcázar on the 1st of May 1828, and at a very early age began writing for the theatre of his native town. The titles of these juvenile performances, which were played by amateurs, were Salga por donde salte, Me voy a Sevilla, and Guadalcázar y el Pilar. As travelling companies never visited Guadalcázar, and as ladies took an active part in the representations, these three plays were written for men only. Ayala persuaded his sister to appear as the heroine of his comedy, La primera Dama, and the innovation, if it scandalized some of his townspeople, permitted him to develop his talent more freely. In his twentieth year he matriculated at the university of Seville, but his career as a student was undistinguished. In Seville he made acquaintance with Garcia Gutierrez, who is reported to have encouraged his dramatic ambitions and to have given him the benefit of his own experience as a playwright. Early in 1850 Ayala removed his name from the university books, and settled in Madrid with the purpose of becoming a professional dramatist. Though he had no friends and no influence, he speedily found an opening. A four-act play in verse, Un Hombre de Estado, was accepted by the managers of the Teatro Español, was given on the 25th of January 1851, and proved a remarkable success. Henceforth Ayala’s position and popularity were secure. Within a twelve-month he became more widely known by his Castigo y Perdón, and by a more humorous effort, Los dos Guamanos; and shortly afterwards he was appointed by the Moderado government to a post in the home office, which he lost in 1854 on the accession to power of the Liberal party. In 1854 he produced Rioja, perhaps the most admired and the most admirable of all his works, and from 1854 to 1856 he took an active part in the political campaign carried on in the journal El Padre Cobos. A zarzuela, entitled Guerra a muerte, for which Emilio Arrieta composed the music, belongs to 1855, and to the same collaboration is due El Agente de Matrimonios. At this date Ayala passed over from the Moderados to the Progressives, and this political manoeuvre had its effect upon the fate of his plays. The performances of Los Comuneros were attended by members of the different parties; the utterances of the different characters were taken to represent the author’s personal opinions, and every speech which could be brought into connexion with the political events at the time was quoted by one party or the other, with its own interpretation. A zarzuela, named El De Castilla, was given amid much uproar on the 20th of February 1856, and, as the piece seemed likely to cause serious disorder in the theatre, it was suppressed by the government after the third performance. Ayala’s rupture with the Moderados was now complete, and in 1857, through the interest of O’Donnell, he was elected as Liberal deputy for Badajoz. His political changes are difficult to follow, or to explain, and they have been unsurprisingly censored. So far as can be judged, Ayala had no strong political views, and drifted with the current of the moment. He took part in the revolution of 1868, wrote the Manifesto of Cadiz, took office as colonial minister, favoured the candidature of the duke of Montpensier, resigned in 1871, returned to his early Conservative principles, and was a member of Alfonso XII’s first cabinet. Meanwhile, however divided in opinion as to his political conduct, his countrymen were practically unanimous in admiring his dramatic work; and his reputation, if it gained little by El Nueo Don Juan, was greatly increased by El Tanto por Cienio and El Tejido de Vidrio. His last play, Consuelo, was given on the 30th of March 1878. Ayala was nominated to the post of president of congress shortly before his death, which occurred unexpectedly on the 30th of January 1879. The best of his lyrical work, excellent for finish and intense sincerity, is his Epístola to Emilio Arrieta, and had he chosen to dedicate himself to lyric poetry, he might possibly have ranked with the best of Spain’s modern singers; as it is, he is a very considerable poet who affects the dramatic form. In his later writings he deals with modern society, its vices, ideals and perils; yet in many essentials he is a manifest disciple of Calderon. He has the familiar Calderonian limitations; the substitution of types for characters, of eloquence for vital dialogue. Nor can he equal the sublime lyricism of his model; but he is little inferior in poetic conception, in dignified idealization, and in picturesque imagery. And it may be fairly claimed for him that in El Tejido de Vidrio and El Tanto por Cienio he displays the exceptional combination of satiric intention with dramatic inspiration. But these plays and by Rioja and Consuelo he is entitled to be judged. They will at least ensure for him an honourable place in the history of the modern Spanish theatre.

A complete edition of his dramatic works, edited by his friend and rival Tamayo y Baus, has been published in seven volumes (Madrid, 1861-1885).

AYE-AYE, a word of uncertain significance (perhaps only an exclamation), but universally accepted as the designation of the most remarkable and abberant of all the Malagasy lemurs (see Primates). The aye-aye, Chiromys (or Daubentonia) madagascanus, is an animal with a superficial resemblance to a long-haired and dusky-coloured cat with unusually large eyes. It has a broad rounded head, short face, large naked eyes, large hands, and long thin fingers with pointed claws, of which the
third is remarkable for its extreme slenderess. The foot resembles that of the other lemurs in its large opposable great toe with a flat nail; but all the other toes have pointed compressed claws. Tail long and bushy. General colour dark brown; the outer fur being long and rather loose, with a woolly undercoat. Teats two, inguinal in position. The aye-aye was discovered by Pierre Sonnerat in 1780, the specimen brought to Paris by that traveller being the only one known until 1860. Since then many others have been obtained, and one lived for several years in the gardens of the Zoological Society of London. Like so many lemurs, it is completely nocturnal in its habits, living either alone or in pairs, chiefly in the bamboo forests. Observations upon captive specimens have led to the conclusion that it feeds principally on fruits, especially of the sugar-cane, which it obtains by tearing open the hard woody circumference of the stalk with its strong incisor teeth; but it is said also to devour certain species of wood-boring caterpillars, which it obtains by first cutting down with its teeth upon their burrows, and then picking them out of their retreat with the claw of its attenuated middle finger. It constructs large ball-like nests of dried leaves, lodged in a fork of the branches of a large tree, and with the opening on one side.

Till recently the aye-aye was regarded as representing a family by itself—the Chiroptera; but the discovery that it resembles the other lemurs of Madagascar in the structure of the inner ear, and thus differs from all other members of the group, has led to the conclusion that it is best classed as a subfamily (Chirodonta) of the Lemuridae. (R. L.*

AYLESBURY, a market-town in the Aylesbury parliamentary division of Buckinghamshire, England, 38 m. N. W. by W. of London; served by the Great Central, Metropolitan and Great Western railways (which use a common station) and by a branch of the London & North-Western railway. Pop. of urban district (1901) 5945. It has connexion by a branch with the Grand Junction canal. The town is built on a flat alluvial plain adjacent to the Vale of Aylesbury, which extends northwards from the foot of the Chiltern Hills. Its streets are mostly narrow and irregular, but picturesque. The church of St Mary, a large cruciform building, is primarily Early English, but has numerous additions of later dates. The font is transitional Norman, a good example; and a small Pre-Norman crypt remains beneath part of the church. There are some Decorated canopied tombs, and the chancel stalls are of the 15th century. The central tower is surmounted by an ornate clock-turret dating from the second half of the 17th century. The county-hall and town-hall, overlooking a broad market-place, are the principal public buildings. The grammar school was founded in 1611. Aylesbury is the assize town for the county, though Buckingham is the county town. There is a large agricultural trade, the locality being especially noted for the rearing of ducks; straw-plaiting and the manufacture of coarse yellow and brown toilets are carried on, and there are printing works. John Jacob, the first bishop of Harrow, was a native of Aylesbury, and in 1689 the neighbourhood of Aylesbury was the residence of the French king Louis XVIII. during his exile (1810-1814).

AYLESBURY (Eylesbar, Eylesberia, Allesberia) was famous in Saxon times as the supposed burial-place of St Osyth. In A. D. 571 it was one of the towns captured by Cuthwulf, brother of Ceawlin, king of the Saxons. At the time of the Domesday survey the king of the Mercians held the manor, charter from Queen Ethelburga, bestowed as a reward for fidelity during the rebellion of the duke of Northumberland, Aylesbury was constituted a free borough corporate, with a common council consisting of a bailiff, 10 aldermen and 12 stewards. The borough returned two members to parliament from this date until the Redistribution Act of 1885, but the other privileges appear to have lapsed in the reign of Elizabeth. Aylesbury evidently had a considerable market from very early times, the site of the market being that of Edward the Confessor at and at the time of the Domesday survey at £16. In 1239 Henry III. made a grant to John, son of Geoffrey FitzPeter of an annual fair at the feast of St Osyth (June 3rd), which was confirmed by Henry VI. in 1481. There is a charter for a fair on the Tuesday after Palm Sunday, and a Monday market for the sale of horses and other animals, grain and merchandise.

AYLESFORD, HENAGE FINCH, 1st Earl of (c. 1649-1719), 2nd son of Henage Finch, 1st earl of Aylesbury, was educated at Westminster school and at Christ Church, Oxford, where he matriculated on the 18th of November 1664. In 1673 he became a barrister of the Inner Temple; king's counsel and bencher in 1677; and in 1679, during the chancellorship of his father, was appointed solicitor-general, being returned to parliament for Oxford University, and in 1685 for Guildford. In 1682 he represented the crown in the attack upon the corporation of London, and next year in the prosecution of Lord Russell, when, according to Burnet, "and in several other trials afterwards, he showed more of a vicious eloquence in turning matters with some subtlety against the prisoners than of strict or sincere reasoning." He does not, however, appear to have exceeded the duties of prosecutor for the crown as they were then understood. In 1684, in the trial of Algernon Sidney, he argued that the unpublished treatise of the accused was an overt act, and supported the opinion of the chief justice that scribere est orare. The same year he was counsel for James in his successful action against Titus Oates for libel, and in 1685 prosecuted Oates for the crown for perjury. Finch, however, though a Tory and a crown lawyer, was a staunch churchman, and on his refusal in 1686 to defend the royal dispensing power he was summarily dismissed by James. He was the leading counsel in June 1688 for the seven bishops, when he "strangely exposed and very boldly ran down the" dispensing power, but his mistaken tactics were nearly the cause of his clients losing their case. He sat again for Oxford University in the convention parliament, which constituency he represented in all the following assemblies except that of 1695, till his elevation to the peerage. He was, however, no supporter of the House of Orange, advocated a regency in James's name, and was one of the few who in the House of Commons opposed the famous vote that James had broken the contract between king and people and left the throne vacant. He held no office during William's reign, but was described by Macky as "always a great top serf in the administration." In 1688 he joined in voting for the reversal of Lord Russell's attainder, and endeavoured to defend his conduct in the trial, but was refused a hearing by the House. He opposed the Triennial Bill of 1692, but in 1696 spoke against the bill of association and test, which was voted for the king's protection, on the ground that though William was to be obeyed as sovereign he could not be acknowledged "rightful and lawful king." In 1694 he argued against the crown in the bankers' case. In 1703 he was created baron of Guernsey and a privy councillor, and after the accession of George I. on the 19th of October 1714, earl of Aylesford, being reappointed a privy counsellor and made chamberlain of the duchy of Lancaster, which office he retained till February 1716. He died on the 22nd of July 1716. According to John Macky (Memoirs, p. 71; published by Roxburghe Club, 1869) he was accounted "one of the greatest orators in England, a good lawyer, an assiduous supporter of the prerogative of the crown and jurisdiction of the church; a tall, thin, black man, splenetic." He married Elizabeth, daughter and co-heiress of Sir John Banks of Aylesford, by whom, besides six daughters, he had three sons, of whom the eldest, Henage, succeeded him as 2nd earl of Aylesford. The 2nd earl died in 1757, and since this date the earldom has been held by his direct descendants, six of whom in succession have borne the Christian name of Henage.

Many of his legal arguments are printed in State Trials (see esp. viii. 694, 1087, ix. 625, 880, 996, x. 126, 319, 405, 1199, xii. 183, 353, 365). Wood attributes to him on the faith of common rumour the authorship of Thee Oposite und Navigator... Remarks upon it... printed by Lady (Rachael) Russell (1683), ascribed in State Trials (ix. 710) to Sir Bartholomew Shower; but see the latter's allusion to it on p. 753.

1 Hist. of His Own Times, i. 556. Swift has appended a note, "an arrant rascal," but Finch's great offence with the dean was probably his advancement by George I. rather than his conduct of state trials as here described.

2 Ibid. 572, and Speaker Onslow's note.

4 State Trials, xii. 353.
AYLESFORD—AYMESTRY LIMESTONE

AYLESFORD, a town in the Medway parliamentary division of Kent, England, 3½ m. N.W. of Maidstone on the South-Eastern & Chatham railway. Pop. (1901) 2678. It stands at the base of a hill on the right bank of the Medway. The ancient church of St Peter (restored in 1878) is principally Perpendicular, but contains some Norman and Decorated portions. It has interesting brasses of the 15th and 16th centuries and an early embattled tower. At a short distance west, a residence occupying part of the site, are remains of a Carmelite friary, founded here in 1240. It is claimed for this foundation (but not with certainty) that it was the first house of Carmelites established in England, and the first general chapter of the order was held here in 1245. Several remains of antiquity exist in the neighbourhood, amongst them a cromlech called Kit's Coty House, about a mile north-east from the village. (See Stone Monuments, Plate, fig. 2.) In accordance with tradition this has been thought to mark the burial-place of Catigern, who was slain here in a battle between the Britons and Saxons in A.D. 645; the name has also been derived from Celtic 

AYLTON, LUCAS VASQUEZ DE (c. 1475-1526), Spanish adventurer and colonizer in America, was born probably in Toledo, Spain, about 1475. He accompanied Nicolas Ovando to Hispaniola (Santo Domingo) in 1502, and there became a magistrate of La Concepcion and other towns, and a member of the superior court of Hispaniola. He engaged with great profit in various commercial enterprises, became interested in a plan for the extension of the Spanish settlements to the North American mainland, and in 1521 sent Francisco Gordillo on an exploring expedition which touched on the coast of the Florida peninsula and coasted for some distance northward. Gordillo's report of the region was so favourable that Ayllon in 1523 obtained from Charles V. a rather indefinite charter giving him the right to plant colonies. He sent another reconnoitring expedition in 1525, and early in 1526 he himself set out with 500 colonists and about 100 African slaves. He touched at several places along the coast, at one time stopping long enough to replace a wrecked ship, and had also the first instance of shipbuilding on the North American continent. Sailing northward to about latitude 35° 40', he began the construction of a town which he called San Miguel. The exact location of this town is in dispute, some writers holding that it was on the exact spot upon which Jamestown, Va., was later built; more probably, however, as Lowery contends, it was near the mouth of the Pedee river. The employment of negro slaves here was undoubtedly the first instance of the sort in what later became the United States. The spot was unhealthy and fever carried off many of the colonists, including Ayllon himself, who died on the 18th of October 1526. After the death of their leader dissensions broke out among the colonists, some of the slaves rebelled and escaped into the forest, and in December the town was abandoned and the remnant of the colonists embarked for Hispaniola, less than 150 arriving in safety. See Woodbury Lowery, Spanish Settlements within the Present Limits of the United States (2 vols., New York, 1903-1905).

AYLMER, JOHN (1521-1594), English divine, was born in the year 1521 at Aymestrey Hall, in the county of Shropshire, where he was educated. While still a boy his precocity was noticed by Henry Grey, marquis of Dorset, afterwards duke of Suffolk, who sent him to Cambridge, where he seems to have become a fellow of Queens' College. About 1541 he was made chaplain to the duke, and tutor to his daughter, Lady Jane Grey. His first preferment was the archdeaconry of Stow, in the diocese of Lincoln, but his opposition in convolution to the doctrine of substantiation led to his deprivation and to his flight into Switzerland. While there he wrote a reply to John Knox's famous Blast against the Monstrous Regiment of Women, under the title of An Harrowe for Faithfull and Trew Subjectes, &c., and assisted John Foxe in translating the Acts of the Martyrs into Latin. On the accession to the throne of Mary he was exiled to England. In 1559 he resumed the Stow archdeaconry, and in 1562 he obtained that of Lincoln. He was a member of the famous convocation of 1562, which reformed and settled the doctrine and discipline of the Church of England. In 1576 he was consecrated bishop of London, and while in that position made himself notorious by his harsh treatment of all who differed from him on ecclesiastical questions, whether Puritan or Papist. Various efforts were made to remove him to another see. He is frequently assailed in the famous Martrpole Tracts, and is characterized as "Morrell," the bad shepherd, in Spenser's Shepherds Calendar (July). His reputation as a scholar hardly balances his inadequacy as a bishop in the transition time in which he lived. He died in June 1594. His Life was written by John Strype (1701).

AYMARA (anc. Colla), a tribe of South American Indians, formerly inhabiting the country around Lake Titicaca and the neighbouring valleys of the Andes. They form now the chief ethnic element in Bolivia, but are of very mixed blood. In early days the home of the Aymaras by Lake Titicaca was a "country of towers," and many folk-tales and national legends attributed the origin of all Quichua (Inca) civilization to this region. The Aymaras, indeed, seem to have possessed a very considerable culture before their conquest by the Incas in the 13th and 14th centuries, evidence of which remains in the megalithic ruins of Tiahuanaco. When the Spaniards arrived the Aymaras had been long under the Inca domination, and were in a decadent state. They, however, retained certain privileges, such as the use of their own language; and their treatment by their conquerors generally suggested that the latter believed themselves of Aymara blood. Physically, the pure Aymara is short and thick-set, with a great chest development, and with the same reddish complexion, broad face, black eyes and rounded forehead which distinguish the Quichuas. Like the latter, too, the Aymaras are sullen and apathetic in disposition. They number now, including half-breeds, about half a million in Bolivia. Some few are also found in southern Peru. See Journal Ethnol. Society (1870), "The Aymara Indians of Bolivia and Peru." AYMER, or ÆTHELMAR, OF VALENCE (d. 1260), bishop of Winchester, was a half-brother of Henry III. His mother was Isabelle of Angoulême, the second wife of King John, his father was Hugo of Lusignan, the count of La Marche, whom Isabelle married in 1220. The children of this marriage came to England in 1247 in the hope of obtaining court preferment. In 1250 the king, by putting strong pressure upon the electors, succeeded in obtaining the see of Winchester for Aymer. The appointment was in every way unsuitable. Aymer was illiterate, ignorant of the English language, and wholly secular in his mode of life. Upon his head was concentrated the whole of the popular indignation against the foreign favourites; and he seems to have deserved this unenviable distinction. At the parliament of Oxford (1258) he and his brothers repudiated the new constitution proposed by the barons, but being themselves, and other half-breeds, exiled in Wolvesey castle, and finally compelled to surrender and leave the kingdom. He had never been consecrated; accordingly in 1259 the chapter of Winchester proceeded to a new election. Aymer, however, gained the support of the pope; he was on his way back to England when he was overtaken by a fatal illness at Paris. See W. Stubbs' Constitutional History, vol. ii. (1896); G. W. Prothero's Simon de Montfort (1877); W. H. Blaauw's Barons' War (1881).

AYMESTRY LIMESTONE, an inconstant limestone which occurs locally in the Ludlow series of Silurian rocks, between the Upper and Lower Ludlow shales. It derives its name from Aymestry in Herefordshire, where it may be seen on both sides of the river Lugg. It is well developed in the neighbourhood of Ludlow (it is sometimes called the Ludlow limestone) and occupies a similar position in the Ludlow shales at Woolhope,
the Abberley Hills, May Hill and the Malvern Hills. In lithological character it varies greatly; in one place it is a dark grey, somewhat crystalline limestone, elsewhere it passes into a flabby, earthy or shaly condition, or even into a mere layer of nodules. When well developed it may reach 50 ft. in thickness, and of from 1 to 5 ft.; in this condition it naturally forms a conspicuous feature in the landscape because it stands out by its superior hardness from the soft shales below and above.

The most common fossil is *Peniamerus Knightii*, which is extremely abundant in places. Other brachiopods, corals and trilobites are present, and are similar to those found in the Wenlock limestone. (See SILURIAN.)

**AYR**, a royal, municipal and police burgh and seaport, and county town of Ayrshire, Scotland, at the mouth of the river Ayr, 414 m. S.S.W. of Glasgow by the Glasgow & South-Western railway. Pop. (1891) 24,044; (1901) 29,101. It is situated on a fine bay and its beautiful sands attract thousands of summer visitors. Ayr proper lies on the south bank of the river, which is crossed by three bridges, besides the railway viaduct—the Victoria Bridge (erected in 1898) and the famous "Twa Brigs* of Burns. The Auld Brig is said to date from the reign of Alexander III. (d. 1286). The New Brig was built in 1788, mainly owing to the efforts of Provost McIntyre. The absence which Burns put into the mouth of the steamboat structure came true in 1877, when the newer bridge yielded to floods and had to be rebuilt (1879); and the older structure itself was closed for public safety in 1904. The town has extended greatly on the southern side of the stream, where, in the direction of the racecourse, there are now numerous fine villas. The county buildings, designed after the temple of Isis in Rome, accommodate the circuit and provincial courts and various local authorities. The handsome town buildings, surmounted by a fine spire 226 ft. high, contain assembly and reading rooms. Of the schools the most notable is the Academv (rebuilt in 1886), which in 1764 superseded the grammar school of the burgh, which existed in the 13th century. The Gothic Wallace Tower in High Street stands on the site of an old building of the same name taken down in 1835, from which were transferred the clock and bells of the Dungeon steeple. A niche in front is filled by a statue of the Scottish hero by James Thom (1802-1850), a self-taught sculptor. There are statues of Burns, the 13th earl of Eglinton, General Smith Neil and Sir William Wallace. The Carnegie free library was established in 1893. The charitable institutions include the county hospital, district asylum, a deaf and dumb home, the Kyle combination industrial school, St John's refuge and industrial schools for boys and girls. *The Ayr Advertiser* first appeared on 5th of August 1803, and was the earliest newspaper published in Ayrshire. In the suburbs is a racecourse where the Western Meeting is held in September of every year. The principal manufactures include leather, carpets, woolen goods, flannels, blankets, lace, boots and shoes; and fisheries and shipbuilding are also carried on. There are several foundries, engineering establishments and saw mills. Large quantities of timber are imported from Canada and Norway; coal, iron, manufactured goods and agricultural produce are the chief exports. The harbour, with wet and slip dock, occupies both sides of the river from the New Bridge to the sea, and is protected on the south by a pier projecting some distance into the sea, and on the north by a breakwater with a commodious dry dock. There are esplanades to the south and north of the harbour. The town is governed by a provost and council, and united with Irvine, Inveraray, Campbeltown and Oban in returning one member to parliament.

In 1853 the municipal boundary was extended northwards beyond the river so as to include Newton-upon-Ayr and Wallace Town, formerly separate. Newton is a burgh or barony of very ancient creation, the charter of which is traditionally said to have been granted by Robert Bruce in favour of forty-eight of the inhabitants who had distinguished themselves at Bannockburn. The suburb is now almost wholly occupied with manufactures, the chief of which are chemicals, boots and shoes, carpets and lace. It is on the Glasgow & South-Western railway, and has a harbour and dock from which coal and goods are the main exports. About 3 m. north of Ayr is Prestwick, a popular watering-place and the headquarters of one of the most flourishing golf clubs in Scotland. The outstanding institution of Ayr, however, is the pleasant suburb of Alloway, 25 m. to the south, with which there is frequent communication by electric cars. The "auld clay biggin" in which Robert Burns was born on the 25th of January 1759, has been completely repaired and is now the property of the Ayr Burns's Monument trustees. In the kitchen is the box bed in which the poet was born, and many of the articles of furniture belonged to his family. Adjoining the cottage is a museum of Burnsiana. The "auld haunted kirk," though roofless, is otherwise in a fair state of preservation, despite relic-hunters who have removed all the woodwork. In the churchyard is the grave of William Burness, the poet's father. Not far distant, on a conspicuous position close by the banks of the Doon, stands the Grecian monument to Burns, in the grounds of which is the grotto containing Thom's figures of Tam o' Shanter and Souter Johnnie.

Nothing is known of the history of Ayr till the close of the 12th century, when it was made a royal residence, and soon afterwards a royal burgh, by William the Lion. During the wars of Scottish independence the presence of the poet and his prominent kinsman was an object of importance to both the contending parties, and the town was the scene of many of Wallace's exploits. In 1315 the Scottish parliament met in the church of St John to confirm the succession of Edward Bruce to the throne. Early in the 16th century it was a place of considerable influence and trade. The liberality of William the Lion had bestowed upon the corporation an extensive grant of lands; while in addition to the well-endowed church of St John, it had two monasteries, each possessed of a fair revenue. When Scotland was overrun by Cromwell, Ayr was selected as the site of one of the forts which he built to command the country. This fortification, termed the citadel, enclosed an area of ten or twelve acres, and included within its limits the church of St John, which was converted into a storehouse, the Protector partly indemnifying the inhabitants by contributing £150 towards the erection of a new place of worship, now known as the Old Church. A portion of the tower of St John's church remains, but has been completely modernized. The site of the fort is now nearly covered with houses, the barracks being in Fort Greuch.

**AYRER, JAKOB** (?-1605), German dramatist, of whose life little is known. He seems to have come from Nuremberg as a boy and was naturalized by his way up to the position of imperial notary. He died at Nuremberg on the 26th of March 1605. Besides a rhymed *Chronik der Stadt Bamberg* (edited by J. Heller, Bamberg, 1838), and an unprinted translation of the Psalms, Ayer has left a large number of dramas which were printed at Nuremberg under the title *Opus Theatricon* in 1618. This collection contains thirty tragedies and comedies and thirty-six *Fastnachtsspiele* (Shrovetide plays) and *Singspiele*. As a dramatist, Ayer is virtually the successor of Hans Sachs (q.v.), but he came under the influence of the so-called *Englische Komödianten*, that is, troupes of English actors, who, at the close of the 16th century and during the 17th, repeatedly visited the continent, bringing with them the repertory of the Elizabethan theatre. From those actors Ayer learned how to enliven his dramas with sensational incidents and spectacular effects, and from them he borrowed the character of the clown. His plays, however, are in spite of his foreign models, hardly more dramatic, in the true sense of the word, than those of Hans Sachs, and they are inferior to the latter in poetic qualities. The plots of two of his comedies, *Von der schönen Phoenica* and *Von der schönen Sibele*, were evidently drawn from the same sources as those of Shakespeare's *Much Ado about Nothing* and *Tempest*.

**Ayers Dracon**, edited by A. von Keller, have been published by the Stuttgarter Lit. Verein (1864-1865). See also L. Tieck, *Deutsches Theater* (1817); A. Cohn, *Shakespeare in Germany* (1885), which contains a translation of the two plays mentioned above; J. Tittmann, *Schauspiele des sechzehnten Jahrhunderts* (1888).

**AYRSHIRE**, a south-western county of Scotland, bounded N. by Renfrewshire, E. by Lanarkshire and Dumfriesshire, S.E. by
AYRSHIRE

Kirkcudbrightshire, S. by Wigtownshire and W. by the Firth of Clyde. It includes off its coast the conspicuous rock of Ailsa Craig, 10 m. of Girvan, Lady Island 3 m. S.W. of Troon, and Horse Island, off Ardrossan. Its area is 724,523 acres or 1,142 sq. m., its coast-line being 70 m. long. In former times the shire was divided into the districts of Cunninghame (N. of the Irvine), Kyle (between the Irvine and the Doon), and Carrick (S. of the Doon), and these terms are still occasionally used. Kyle was further divided by the Ayr into King's Kyle on the north and Kyle Stewart. Robert Bruce was earl of Carrick, a title now borne by the Prince of Wales. The county is politically divided into North and South Ayrshire, the former comprising Cunninghame and the latter Kyle and Carrick. The surface is generally undulating with a small mountainous tract in the north and a larger one in the south and south-east. The principal hills are Black Craig (2,298 ft.), 5 m. south-east of New Cumnock; Enoch (1,856 ft.), 5 m. east of Dalmellington; Polmadie (1,750 ft.) 2 m. south-east of Burrr; Stake on the confines of Ayrshire and Renfrewshire, and Cosancane (1,547 ft.), 3 m. north-east of New Cumnock. None of the rivers is navigable, but their varied and tranquil beauty has made them better known than many more important streams. The six most noted are the Stinchar, the Doon, the Irvine, the Nith and the Garnock. Of these the Ayr is the longest. It rises at Glenbuck, on the border of Lanarkshire, and after a course of some 38 m. falls into the Firth of Clyde at the town which, with the county, is named from it. The scenery along its banks from Dorn downw-ards—passing Catrine, Ballochmyle, Barskimming, Sundrum, Auchencruive and Craigne.—is remarkably picturesque. The lesser streams are numerous, but Burns's verse has given preeminence to the Axtan, the Cessnock and the Lugar. There are many lochs, the largest of which is Loch Doon, 33 m. long, the source of the river of the same name. From Loch Finlas, into 20 m. south-east of Ayr, the town derives its water-supply. The Nith rises in Ayrshire and a few miles of its early course belong to the county.

Geology.—The greater portion of the hilly region in the south of the county forms part of the Silurian tabular of the south of Scotland. Along its north margin there is a belt of elevated ground consisting mainly of Old Red Sandstone strata, while the tract of fertile low ground is chiefly occupied by younger Palaeozoic rocks. The Silurian belt stretching eastwards from the mouth of Loch Ryan to the Merrick range is composed of grits, greywackes and shales with thin layers of black shales, containing graphitites of Upper Llandovery age with disseminations of coal. Lake Llandovery was a large inland sea, the sediments of which were deposited in their northern limit Radiolarian cherts, mudstones and limestones of Arenig age rise from underneath the former along anticlines striking north-east and south-west. In the Ballantrane region there is a remarkable thickness of volcanic rocks and agglomerates of Arenig age; their horizon being defined by graphitites occurring in cherty mudstones and black shales interleaved in limestones and agglomerates. These volcanic materials are pierced by serpentine, gabbro and granite. The serpentine formation is represented over a wide area from Head and from Burnfoot, being typically developed on Balmahine Hill near Colmonell. Gabbro appears on the shore north of Lendalfoot, while on the Bye and Grey Hills south of Girvan there are patches of granite and quartz-diorite which seem to pass into porphyritic rocks. Older Palaeozoic rocks and Radiolarian cherts are covered unconformably by conglomerates (Bennan Hill near Stranraer and Kennedy's Pass) which are associated with limestones of Upper Llandovery age that have been widely distributed. Near important with the peninsula west of the Luce Bay, the river Girvan there is a sequence from Llandeilo—Cardoc to Landon—Tarannan strata, excellent sections of which are seen on the shore north of Kennedy's Pass and in Pennwapple Glen near Girvan. These strata are overlain by Old Red Sandstone and Carboniferous forma- tions. While the order of succession is determined by the graphittites. Near Muirkirk and in the Douglas Water there are inliers of Wensley, Ludlow and Downtonian rocks, coming to the surface along anticlines truncated by Niggian rocks and bounded by the Carboniferous and the Upper Old Red Sandstone strata. In the southeast of the county there is a part of the large granite mass that stretches from Loch Doon south to Loch Leve, giving rise to wild scenery and bounded by the high ground near the head of the Girvan Water, boulders of which have been dis tributed over a wide area during the glacial period. Along the northern margin of the uplands the Lower Old Red Sandstone is usually faulted against the Silurian strata, but on Hadyard Hill south of the Girvan valley they rest on the folded and denuded members of the latter system. The three divisions of this formation are well represented. The lower group of conglomerates and sandstones is well displayed on Hadyard Hill and on the tract near Maybole; the middle volcanic series on the shore south of the Heads of Ayr and from the Stinchwin valley along the Old Red belt towards Dalmellington and New Cumnock; while the upper group, com prising the upper displaced beds, the shales and the lower coal formation, is usually masked by the covering of the Carboniferous Limestones. The Upper Old Red Sandstone appears as a fringe round the south-west margin of the Carboniferous rocks of the county, and it rises from beneath there on the shore of the Firth of Clyde south of Wemyss Bay. The Cumnock area is here underlaid by a volcanic series which forms a continuous belt of red oolitic sandstones, and passing upwards into the Carboniferous Limestone. The lower limestones of the latter division are typically represented near Dalry and Beith, where in one instance they reach a thickness of over 100 m. They are followed by the coal-bearing group (Upper Old Red Sandstone and Coal Measures, represented by the Millstone Grit) which have been wrought in the Dalry and Patna districts and at Dailly. The position of the Millstone Grit is occupied by lavas and tuffs, extending almost continually as a narrow fringe round the northern margin of the Coal Measures from Saltcoats by Ayr and to Kilmarnocks by the Crawford Water. The workable coals of the true Coal Measures have a wide distribution from Kilwinning to Kilmarnock to Galston and again in the districts of Croyton, Dal mellington and Wemyss Bay. Originally these were all covered by a series of Upper Old red sandstones, probably the equivalents of the red beds of Uddingston, Dalkeith and Wemyss in Fife, visible in the ravines of Lugar near Ochiltree and of Ayr at Catrine. In various districts the Carboniferous strata are overlain by an agglutinated development of the Coal Measures. These are represented on the former by Lower Old sandstones with an underlying series of dolerite in the Kilmarnock and Dalmellington district. The remaining part of the county is nearly covered by the Carboniferous Limestones and the overlying Trias. In the north part of the county, as near Wemyss Bay, the strata are traversed by dykes of dolerite and basalt trending in a north-west direction and probably of Tertiary age.

Agriculture.—There has been no lack of agricultural enterprise. With a moist climate, and, generally, a rather heavy soil, drainage was necessary for the successful growth of green crops. Up to about 1840, a green crop in the rotation was seldom seen, except on porous river-side land, or on the lighter farms of the lower districts. In the early part of the 19th century lime was a powerful auxiliary in the inland districts, but with repeated app lication of lime it was found that lime was not the answer. The answer in the end was to maintain the next great impetus. Enough had been done to test its efficacy before the announcement of Sir Robert Peel's drainage loan, after which it was rapidly extended throughout the country. Green-crop husbandry, and the liberal use of guano and other manures, made a wonderful change in the county, and immensely increased the amount of produce. Potatoes are now extensively grown, the coast-lands supplying the markets of Scotland and the north of England. Of roots, turnips, carrots and mangolds are widely cultivated, heavy crops being obtained by early sowing and rich manuring. Oats form the bulk of the cereal crop, but wheat and barley are also grown. High farming has developed the land enormously. Dairying has received particular attention. Dunlop cheese was once a well-known product. Part of it was very good; but it was unequal in its general character, and unsaleable in English markets. Dissatisfied with the inferior commercial value of their cheese in comparison with some English varieties, the Ayrshire Agricultural Association brought a Somerset farmer and his wife in 1855 to teach the Chadburn family at Ayr and although the art was more difficult to acquire, Chadburn cheese of first-rate quality is now made in Ayrshire, and the annual cheese show at Kilmarnock is the most important in Scotland. The Ayrshire breed of cows are famous for the quantity and excellence of their milk. Great numbers of cattle, sheep and pigs are raised for the market, and the Ayrshire horse is in high repute.

Other Industries.—Ayrshire is the principal mining county in Scotland and has the second largest coalfield. There is a heavy annual output also of iron ore, pig iron and fire-clay. The chief coal districts are Ayr, Dalmellington, Patna, Maybole, Drongan, Irvine, Croyton, Stevenston, Beith, Kilwinning,
Dalry, Kilbirnie, Drehorn, Kilmarnock, Galston, Hurlford, Muirkirk, Cumnock and New Cumnock. Ironstone occurs chiefly at Patna, Coylton, Dalry, Kilbirnie, Drehorn and Cumnock, and there are blast furnaces at most of these towns. A valuable whetstone is quarried at Bridge of Stair on the Ayr—the Water-of-Ayr stone. The leading manufactures are important. At Catrine are cotton factories and bleachfields, and at Ayr and Kilmarnock extensive engineering works, and carpet, blanket and woollens, boot and shoe factories. Cotton, woollens, and other fabrics and hosiery are also manufactured at Dalry, Kilbirnie, Kilmuir, Beith and Stewarton. An extensive trade in chemicals is carried on at Irvine. Near Stevenston works have been erected in the sandhills for the making of dynamite and other explosives. There are large lace curtain factories at Galston, Newmilns and Darvel, and at Beith cabinet-making is a considerable industry. Shipbuilding is conducted at Troon, Ayr, Irvine and Fairlie, which is famous for its yachts. The leading ports are Ardrossan, Ayr, Girvan, Irvine and Troon. Fishing is carried on in the harbours and creeks, which are divided between the fishery districts of Greenock and Ballantrae.

Communications.—The Glasgow & South-Western railway owns most of the lines within the shire, its system serving all the industrial towns, ports and seaside resorts. Its trunk line via Girvan to Stranraer commands the shortest sea passage to Belfast and the north of Ireland, and its main line via Kilmarnock communicates with Dumfries and Carlisle and so with England. The Lanarkshire & Ayrshire branch of the Caledonian railway company also serves at part of the county. For passenger steamer traffic Ardrossan is the principal port, there being services to Arran and Belfast and, during the season, to Douglas in the Isle of Man. Millport, on Great Cumbrae, is reached by steamer from Fairlie.

Population and Administration.—The population of Ayrshire in 1851 was 226,386, and in 1901, 254,468, or 223 to the sq. m. In 1901 the number of persons speaking Gaelic only was 17. The chief towns, with populations in 1901 are: Ardrossan (6077), Auchinleck (2168), Ayr (25,101), Beith (4063), Cumnock (3688), Dalry (3516), Darvel (3070), Galston (4876), Girvan (4024), Hurlford (4061), Irvine (6618), Kilbirnie (4571), Kilmaurs (35,601), KIlbarchan (4465), Largs (5416), Mauchline (5802), Newmilns (4677), Saltcoats (8120), Stevenson (6554), Stewarton (2858), Troon (4764). The county returns two members to parliament, who represent North and South Ayrshire respectively. Ayr (the county town) and Irvine are royal burghs and belong to the Ayr group of parliamentary burghs, and Kilmarnock is a parliamentary burgh of the Kilmarnock group. Under the county council special water districts, drainage districts, and lighting and scavenging districts have been formed. The county forms a sheriffdom, and there are resident sheriffs-substitute at Ayr and Kilmarnock, who sit also at Irvine, Beith, Cumnock and Girvan. The shire is under school-board jurisdiction, but there are considerable numbers of voluntary schools, besides secondary schools at Ayr, Irvine, Kilmarnock and Beith, while Kilmarnock Dalry School is a part of the West of Scotland Agricultural College established in 1890. In addition to grants earned by the schools, the county and borough councils expend a good deal of money upon secondary and technical education, which contributions are also made by the Glasgow and West of Scotland Technical College and the Kilmarnock Dalry School. The technical classes, subsidized at various local centres, embrace instruction in agriculture, mining, engineering, plumbing, gardening, and various science and art subjects.

History.—Traces of Roman occupation are found in Ayrshire. At the time of Agricola’s campaigns the country was held by the Daemnonii, and their town of Vandogara has been identified with a site at Loudoun Hill near Darvel, where a serious encounter with the Scots took place. On the withdrawal of the Romans, Ayrshire formed part of the kingdom of Strathclyde and ultimately passed under the sway of the Northumbrian kings. Save for occasional intertribal troubles, as that in which the Scottish king Alpin was slain at Dalmedingall in the 9th century, the annals are silent until the battle of Largs in 1263, when the pretensions of Haakon of Norway to the sovereignty of the Isles were crushed by the Scots under Alexander III. A generation later, William Wallace conducted a vigorous campaign in the shire. He surprised the English garrison at Ardrossan, and burned the barns of Ayr in which the forces of Edward I. were lodged. Robert Bruce is alleged to have been born at Turnberry Castle, some 12 m. S.W. of Ayr. In 1307 he defeated the English at Loudoun Hill. Cromwell paid the county a hurried visit, during which he demolished the castle of Ardrossan and is said to have utilized the stones in rearing a fort at Ayr. Between 1660 and 1668 the sympathies of the county were almost wholly with the Covenanters, who suffered one of their heaviest reverses at Airds Moss—a morass between the Ayr and Lugar—their leader, Richard Cameron, being killed (20th of July 1668). The county was dragooned and the Highland host ravaged wherever it went. The Hanoverian succession excited no active hostility if it evoked no enthusiasm. Antiquarian remains include cairns in Galston, Sorn and other localities; a road supposed to be a work of the Romans, which extended from Ayr, through Dalrymple and Dalmellington, may be traced to the Nongru, the Danes on the hills of Knockgeogan, and Dundonald; and the castles of Loch Doon, Turnberry, Dundonald, Portencross, Ardrossan and Dunure. There are ruins of celebrated abbeys at Kilwinning and Crossraguel, and of Alloway’s haunted church, famous from their associations.

AYRTON, WILLIAM EDWARD (1837-1908), English physicist, was born in London on the 14th of September 1847. He was educated at University College, London, and in 1868 went out to Bengal in the service of the Indian Government Telegraph department. In 1873 he was appointed professor of physics and telegraphy at the Imperial College of Engineering, Tojiko. On his return to London six years later he became professor of applied physics at the Finsbury College of the City and Guilds of London Technical Institute, and in 1884 he was chosen professor of electrical engineering at the Central Technical College, South Kensington. He published, both alone and jointly with others, a large number of papers on physical, and in particular electrical, subjects, and his name was especially associated, together with that of Professor John Perry, with the invention of a long series of electrical measuring instruments. He died in London on the 8th of November 1908. His wife, Mrs Hertha Ayrton, whom he married in 1885, assisted him in his researches, and became known for her scientific work on the electric arc and other subjects. The Royal Society awarded her one of its Royal medals in 1906.

AYSCOUGH, SAMUEL (1745-1804), English librarian and index-maker, was born at Nottingham in 1745. His father, a printer and stationer, having ruined himself by speculation, Samuel Ayscough left Nottingham for London, where he obtained a position in the cataloguing department of the British Museum. In 1786, he published a two-volume catalogue of the then undescribed manuscripts in the museum. About 1785 he was appointed assistant librarian at the museum, and soon afterwards took hold of the press. In 1786 he published an index to the first seventy volumes of the Monthly Review, and in 1796 indexed the remaining volumes. Both this index and his catalogue of the undescribed manuscripts in the museum were private ventures. His first official work was a third share in the British Museum catalogue of 1787, and he subsequently catalogued the ancient rolls and charters, 16,000 in all. In 1789 he produced the first two volumes of the index to the Gentleman’s Magazine, and in 1790 the first index-concordance to Shakespeare. He was a Fellow of the Society of Antiquaries, and has been called
AYSCUE—AYUB KHAN

"The Prince of Indexers." He died at the British Museum on the 30th of October 1804.

AYSCUE. (erroneously Aske or Ayscough), SIR GEORGE (d. 1652), British admiral, came of an old Lincolnshire family. Beyond the fact that he was knighted by Charles I, nothing is known of his career until in 1646 he received a naval command. Through the latter years of the first civil war, Ayscue seems to have acted as one of the senior officers of the fleet. In 1648, when Sir William Batten went over to Holland with a portion of his squadron, Ayscue's influence kept a large part of the fleet loyal to the Parliament, and in reward for this service he was appointed the following year admiral of the Irish Seas. For his conduct at the relief of Dublin he received the thanks of Parliament, and in 1651 he was employed under Blake in the operations for the reduction of Scilly. He was next sent to the West Indies in charge of a squadron destined for the conquest of Barbadoes and the other islands still under royalist control. This task successfully accomplished, he returned to take part in the first Dutch War. In this he played a prominent part, but the indecisive battle off Plymouth (August 16th, 1652) cost him his command, though an annuity was assigned him. For some years Sir George Ayscue lived in retirement, but the later years of the Commonwealth he spent in Sweden, Cromwell having despatched him with an influential mission. At the Restoration he returned and became one of the commissioners of the navy, but on the outbreak of the second Dutch War in 1664 he once more hoisted his flag as rear-admiral of the Blue, and took part in the battle of Lowestoft (June 3rd, 1665). In the great Four Days' Battle (June 11th-14th, 1666) he served with Monck as admiral of the White. His flagship, the "Prince Royal," was taken on the third day, and he himself remained a prisoner in Holland till the peace. It seems doubtful whether he ever again flew his flag at sea, and the date of his death is supposed to be 1671. Lely's portrait of Sir George Ayscue is in the Painted Hall at Greenwich.

AYTOUN, or AYTOUN, SIR ROBERT (1570-1638), Scottish poet, son of Andrew Aytoun of Kinaldie, Fifeshire, was born in 1570. He was educated at the university of St Andrews, where he was incorporated as a student of St Leonard's College in 1584 and graduated M.A. in 1588. He lived for some years in France, and on the accession of James VI. to the English throne he wrote in Paris a Latin panegyric, which brought him into immediate favour at court. He was knighted in 1584. He held various humble offices and was private secretary to the queens of James I. and Charles I. He died in London and was buried in Westminster Abbey on the 28th of February 1638. His reputation with his contemporaries was high, both personally and as a writer, though he had no ambition to be known as the latter. Aytoun's remains are in Latin and English. In respect of the latter he is one of the earliest Scots to use the southern standard as a literary medium. The Latin poems include the panegyric already referred to, an Epideicticum in obitum Thoma Rhodi; Basia, sive, Strenna ad Jacobum Huyam; Lessus in funere Raphelis Thorei; Carina Caro; and minor pieces, occasional and epiphatic. His first English poem was Diobanthus and Charidora (to which he refers in his Latin panegyric to James). He has left a few pieces on amatory subjects, including songs and sonnets.

Aytoun's Latin poems are printed in Deliciae Poetarum Scotorum (Amsterdam, 1637), i. pp. 40-75. His English poems are preserved in a MS. in the British Museum (Add. MSS. 10,308), which was prepared by his nephew, Sir John Aytoun. Both were collected by Charles Rogers in The Poems of Sir Robert Aytoun (London, privately printed, 1853). This collection is a much smaller one than the first issue by the same editor in 1844. Additional poems are included which cannot be ascribed to Aytoun, and in some cases have been identified as the work of others. The poem dedicated to "Golias" and the Madrigal and a number of other pieces in Spenser's old version of "Auld Lang Syne" and "Sweet Empress" are certainly not Aytoun's. Some of the English poems are printed in Watson's Collection (1700-1711) and in the Bannatyne Miscellany, i. p. 299 (1837). There is a memoir of Aytoun in Rogers's edition, and another by Grosart in the Dict. of Nat. Bio. Particulars of his public career will be found in the printed Calendars of State Papers and Register of the Privy Council of the period.

AYTOUN, WILLIAM EDMONSTOUNE (1813-1865), Scottish poet, humorist and miscellaneous writer, was born at Edinburgh on the 21st of June 1813. He was the only son of Sir Robert Aytoun, a writer to the signet, and the family was of the same stock as Sir Robert Aytoun noticed above. From his mother, a woman of marked originality of character and considerable culture, he derived his distinctive qualities, his early tastes in literature, and his political sympathies, his love for ballad poetry, and his admiration for the Stuarts. At the age of eleven he was sent to the Edinburgh Academy, passing in due time to the university. In 1833 he spent a few months in London for the purpose of studying law; but in September of that year he went to study German at Aschaffenburg, where he remained till April 1834. He then resumed his legal pursuits in his father's chambers, was admitted a writer to the signet in 1835, and five years later was called to the Scottish bar. But, by his own confession, though he "followed the law, he never could overtake it." His first publication—a volume entitled Poland, Homer, and Other Poems, in which he gave expression to his eager interest in the state of Poland—had appeared in 1833. While in Germany he made a translation in blank verse of the first part of Faust; for this, and other translations, it was never published. In 1836 he made his entry to Blackwood's Magazine, in translations from Uhland; and from 1839 till his death he remained on the staff of Blackwood. About 1841 he became acquainted with Mr (afterwards Sir) Theodore Martin, and in association with him wrote a series of light humorous papers on the tastes and follies of the day, in which were interspersed the verses which afterwards became popular as the Bon Gaultier Ballads (1835). The work on which his reputation as a poet chiefly rests is the Lays of the Scottish Cavaliers (1848; 29th ed. 1883). In 1845 he was appointed professor of rhetoric and belles lettres at Edinburgh University. His lectures were very attractive, and the number of students increased correspondingly. His services in support of the Tory party, especially during the Anti-Corn-Law struggle, received official recognition in his appointment (1852) as sheriff of Orkney and Zetland. In 1854 appeared Firmilian, a Spasmodic Tragedy, in which he attacked and parodied the writings of Philip James Bailey, Sydney Dobell and Alexander Smith; and two years later he published Auld Lang Syne, a Poem. Other literary works are a Collection of the Ballads of Scotland (1853), a translation of the Poems and Ballads of Goethe, executed in co-operation with his friend Theodore Martin (1858), a small volume on the Life and Times of Richard I. (1840), written for the Family Library, and a novel entitled Norman Sinclair (1861), many of the details in which are taken from incidents in his own experience. In 1860 Aytoun was elected honorary president of the Associated Societies of Edinburgh University. In 1859 he lost his first wife, a daughter of John Wilson (Christopher North), to whom he was married in 1840, and this was a great blow to him. His mother died in November 1861, and his own health began to fail. In December 1863 he married Miss Kinnear. He died at Blackhills, near Elgin, on the 4th of August 1865.

See Memoir of W. E. Aytoun (1867), by Sir Theodore Martin, with an appendix containing some of his prose essays.

AYUB KHAN (1855- ), Afghan prince, son of Shere Ali (formerly Amir of Afghanistan), and cousin of the Amir Abdur Rahman, was born in 1855. During his father's reign little is recorded of him, but after Shere Ali's expulsion from Kabul by the English, and his death in January 1879, Ayub took possession of Herat, and maintained himself there until June 1881, when he invaded Afghanistan with the view of asserting his claims to the sovereignty, and in particular of gaining possession of Kandahar, still in the occupation of the British. He encountered the British force commanded by General Burrows at Maiwand on the 27th of July, and was able to gain one of the very few pitched battles that have been won by Asiatic leaders over an army under European direction. His triumph, however, was short-lived; while he hesitated to assault Kandahar he was attacked by Sir Frederick (afterwards Lord) Roberts, at the close of the latter's memorable march from Kabul, and utterly discomfited,
20th of September 1880. He made his way back to Herat, where he remained for some time unmolested. In the summer of 1881 he again invaded Afghanistan, and on the anniversary of the battle of Maiwand obtained a signal victory over Abdur Rahman's lieutenants, mainly through the defection of a Durani regiment. Kandahar fell into his hands, but Abdur Rahman now took the field in person, totally defeated Ayub, and expelled him from Herat. He took refuge in Persia, and for some time lived quietly in receipt of an allowance from the Persian government. In 1887 internal troubles in Afghanistan tempted him to make another endeavour to seize the throne. Defeated and driven into exile, he wandered for some time about Persia, and in November gave himself up to the British agent at Meshed. He was sent to India to live as a state prisoner.

AYUNTAMIENTO, the Spanish name for the district over which a town council has administrative authority; it is used also for a town council, and for the town hall. The word is derived from the Latin ad(i)jungere, and originally meant "meeting." In some parts of Spain and in Spanish America the town council was called the cabildo or chapter, from the Latin caput(s) hill. The ayuntamiento consisted of the official members, and of regidores or regulators, who were chosen in varying proportions from the "hidalgos" or nobles (hijos de albo, sons of somebody) and the "pecheros," or commoners, who paid the pecho, or personal tax; pecho (Lat. pecius) is in Spanish the breast, and then by extension the person. The regidores of the ayuntamientos, or lay cabildos, were checked by the royal judge or corregidor, who was in fact the permanent chairman or president. The distinction between hidalgo and pechero has been abolished in modern Spain, but the powers and the constitution of ayuntamientos have been subject to many modifications.

AYUTHIA, a city of Siam, now known to the Siamese as Krong Kao or "the Old Capital," situated in 100° 32' E., 21° 21' N. Pop. about 10,000. The river Me Nam, broken up into a network of creeks, here surrounds a large island upon which stand the ruins of the famous city which was for more than four centuries the capital of Siam. The bulk of the inhabitants live in the floating houses characteristic of lower Siam, using as thoroughfares the creeks to the edges of which the houses are moored. The ruins of the old city are of great archaeological interest, as are the relics, of which a large collection is housed in the local museum. Outside the town is an ancient masonry enclosure for the capture of elephants, which is still periodically used. Ayuthia is on the northern main line of the state railways, 2.4 mi. from Bangkok. Great quantities of padi are annually sent by river and rail to Bangkok, in return for which cloth and other goods are obtained. It is to be supposed that the workmen of the government were hard at work on fulfilling the orders of the government. There is no other trade. Ayuthia is the chief town of one of the richest agricultural provincial divisions of Siam and is the headquarters of a high commissioner. The government offices occupy spacious buildings, once a royal summer retreat; the government is that of an ordinary provincial division (Monton).

Historically Ayuthia is the most interesting spot in Siam. Among the innumerable ruins may be seen those of palaces, pagodas, churches and fortifications, the departed glories of which are recorded in the writings of the early European travellers who first brought Siam within the knowledge of the West, and laid the foundations of the present foreign intercourse and trade. The town was twice destroyed by the Burmese, once in 1555 and again in 1577, and from the date of the second destruction it ceased to be the capital of the country.

AZAIS, PIERRE HYACINTHE (1760-1845), French philosopher, was born at Sorèze and died at Paris. He spent his early years as a teacher and a village organist. At the outbreak of the Revolution he viewed it with favour, but was soon disgusted at the violence of its methods. A critical pamphlet drew down upon him the hatred of the revolutionists, and it was not until 1806 that he was able to settle in Paris. In 1809 he published his great work, Des Compensations dans les destinées humaines (5th ed. 1846), which pleased Napoleon so much that he made his author professor at St Cyr. In 1811 he became inspector of the public library at Avignon, and from 1812 to 1815 he held the same position at Nancy. The Restoration government at first suspected him as a Bonapartist, but at length granted him a pension. From that time he occupied himself in editing and the publication of philosophical works. In the Compensations he sought to prove that, on the whole, happiness and misery are equally balanced, and therefore that men should accept the government which is given them rather than risk the horrors of revolution. "Le principe de l'inégalité naturelle et essentielle dans les destinées humaines conduit inévitablement au fanatisme révolutionnaire ou au fanatisme religieux." The principles of compensation and equilibrium are found also in the physical universe, the product of matter and force, whose cause is God. Force, naturally expansive and operating on the homogeneous atoms which constitute elemental matter, is subject to the law of equilibrium, or equivalence of action and reaction. The development of phenomena under this law may be divided into three stages—the physical, the physiological, the intellectual and moral. The immaterial in man is the expansive force inherent in him. Moral and political phenomena are the result of the opposing forces of progress and preservation, and their perfection lies in the fulfilment of the law of equilibrium or universal harmony. This may be achieved in seven thousand years, when man will vanish from the world. In an additional five thousand, a similar equilibrium will obtain in the physical sphere, which will then pass away. In addition to his philosophical work, Azais studied music under his father, Pierre Hyacinthe Azaïs (1743-1796), professor of music at Sorèze and Toulouse, and composer of sacred music in the style of Gossec. He wrote for the Revue musicale a series of articles entitled Acoustique fondamentale (1831), containing an ingenious, but now exploded, theory of the vibration of the air. His other works are: Système universel (8 vols., 1812); Du Sort de l'homme (3 vols., 1820); Cours de philosophie (8 vols., 1824), reproduced as Explication universelle (3 vols., 1826-1828); Jeunesse, moralité, religion, philosophie (1837); De la phrénologie, du magnétisme, et de la folie (1843).

AZAÉLA, a genus of popular hardy or greenhouse plants, belonging to the heath order (Ericaceae), and scarcely separable botanically from Rhododendron. The beautiful varieties now in cultivation have been bred from a few originals, natives of the hilly regions of China and Japan, Asia Minor, and the United States. They are perhaps unequalled as indoor decorative plants. They are usually increased by grafting the half-ripened shoots of the stronger-growing kinds, the shoots of the stock and the grafts being in a similarly half-ripened condition, and the whole being tied together. After the grafting the inferior kinds, if healthy, may be grafted all over with the chooser sorts, so as to obtain a large specimen in a short time. They require a rich and fibrous peat soil, with a mixture of sand to prevent its getting water-logged. The best time to pot azaleas is three or four weeks after the blooming is over. The soil should be made quite solid to prevent its retaining too much water. To produce handsome plants, they must while young be stopped as required. Specimens that have got leggy may be cut back just before growth commences. The lowest temperature for them during the winter is about 35°, and during their season of growth from 55° to 65° at night, and 75° by day, the atmosphere being at the same time well charged with moisture. They are liable to the attacks of thrips and red spider, which do great mischief if not promptly destroyed.

The following are some well-known species—\(A. \text{ arborea}\) (Pennsylvania), a deciduous shrub 10-20 ft. high; \(A. \text{ calendulae}\) (Carolina to Pennsylvania), a beautiful deciduous shrub 2-6 ft. high, with yellow, red, orange and copper-coloured flowers; \(A. \text{ hispida}\), a North American shrub, 10-15 ft. high, flowers white edged with red; \(A. \text{ indica}\) (China), the so-called Indian azalea, a shrub 3-6 ft. or more high, the original of many single and double varieties, many of the more vigorous of which are hardy in southern England and Ireland; \(A. \text{ nudiflora}\), a North American shrub, 3-4 ft. high, which hybridizes freely with \(A. \text{ calendulae}\), \(A. \text{ pontica}\) and others, to produce single and
AZAMGARH—AZANGLIO

double forms of a great variety of shades; *A. pontica* (Levant, Caucasus, &c.), 4–6 ft. high, with numerous varieties differing in the colour of the flowers and the tint of the leaves; *A. sinensis* (China and Japan), a beautiful shrub, 3–4 ft. high, with orange- or yellow bell-shaped flowers, hardy in the southern half of England, large numbers of varieties being cultivated under the name of Japanese azaleas.

AZAMGARH, or Azamgarh, a city and district of British India, in the Gorakhpur division of the United Provinces. The town is situated on the river Tons, and has a railway station. It is said to have been founded about 1665 by a powerful landholder named Azim Khan, who owned large estates in this part of the country. Pop. (1901) 18,835.

The area of the district is 2,207 sq. m. It is bounded on the N. by the river Gogra, separating it from Gorakhpur district; on the E. by Ghazipur district and the river Ganges; on the S. by the districts of Jaunpur and Ghazipur; and on the W. by Jaunpur and Fyzabad. The portion of the district lying along the banks of the Gogra is a low-lying tract, varying considerably in width; south of this, however, the ground takes a slight rise. The slope of the land is from north-west to south-east, but the general surface of the district is very inadequate. Roughly speaking, the district consists of a series of parallel ridges, whose summits are depressed into beds or hollows, along which the rivers flow; while between the ridges are low-lying rice lands, interspersed with numerous natural reservoirs. The soil is fertile, and very highly cultivated, bearing magnificent crops of rice, sugar-cane and indigo. There are several indigo factories. A branch of the Bengal & North-Western railway to Azamgarh town was opened in 1898. In 1901 the population was 1,299,785, showing a decrease of 11% in the decade. The district was ceded to the Company in 1801 by the wazirs of Lucknow. In 1857 it became a centre of mutiny. On the 3rd of June 1857 the 17th Regiment of Native Infantry mutinied at Azamgarh, murdered some of their officers, and carried off the government treasure to Fyzabad. The district became a centre of the fighting between the Gurkhas and the rebels, and was not finally cleared until October 1858 by Colonel Kelly.

AZĂN (Arabic for “announcement”), the call or summons to pubic prayers proclaimed by the Muezzin (crier) from the minaret, twice daily, in all Mahomedan countries. In small mosques the Muezzin at Azăn stands at the door or at the side of the building; in large ones he takes up his position in the minaret. The call translated runs: “God is most great!” (four times), “I testify there is no God but God!” (twice), “I testify that Mahomet is the apostle of God!” (twice), “Come to prayer!” (twice), “Come to salvation!” (twice), “God is most great!” (twice). “There is no God but God!” To the morning Azăn are added the words, “Prayer is better than sleep!” (twice). The devout Moslem has to make a set response to each phrase of the Muezzin. At first these are mere repetitions of Azăn, but to the cry “Come to prayer!” the listener must answer, “I have no power nor strength but from God the most High and Great.” To that of “Come to salvation!” the formal response is, “What God willeth will be: what He willeth not will not be.” The recital of the Azăn must be listened to with the utmost reverence. The passers in the streets must stand still, all those at work must cease from their labours, and those in bed must sit up.

The Muezzin, who is a paid servant of the mosque, must stand with his face towards Mecca and with the points of his forefingers in his ears while reciting Azăn. He is specially chosen for good character, and Azăn must not be recited by any one unclean, by a drunkard, by the insane, or by a woman. The summons to prayer was at first simply “Come to prayer!” Mahomet, anxious to invest the call with the dignity of a ceremony, took counsel of his followers. Some suggested the Jewish trumpet, others the Christian bell, but according to legend the matter was finally settled by a dream:—“While the matter was under discussion, Abdallah, a Khazrajite, dreamed that he met a man clad in green raiment, carrying a bell. Abdallah sought to buy it, saying that it would do well for bringing together the assembly of the faithful. ‘I will show thee a better way,’ replied the stranger, ‘let a crier cry aloud “God is most great, &c.” ’ On awaking, Abdallah went to Mahomet and told him his dream, and Azăn was thereupon instituted.

AZARA, DON JOSE NICHOLAS DE (1731–1804), Spanish diplomatist, was born in 1731 at Barbanulas, Aragon, and was appointed in 1765 Spanish agent and procurator-general, and in 1785 ambassador at Rome. During his long residence there he distinguished himself as a collector of Italian antiquities and as a patron of art. He was also an able and active diplomatist, took a leading share in the difficult and hazardous task of the expulsion of the Jesuits from Spain, and was instrumental in securing the election of Pius VI. He withdrew to Florence when the French took possession of Rome in 1798, but acted on behalf of the pope during his exile and after his death at Valence in 1799. He was afterwards Spanish ambassador in Paris. In that post it was his misfortune to be forced by his government to conduct the negotiations which led to the treaty of San Ildefonso, by which Spain was wholly subjected to Napoleon. Azara was friendly to a French alliance, but his experience showed him that the enemy was being sacrificed to Napoleon. The First Consul liked him, and he went with him to Tilsit. Azara died, worn out, in Paris in 1804. His end was undoubtedly embittered by his discovery of the ills which the French alliance must produce for Spain.

Several sympathetic notices of Azara will be found in Thiers, Consulat et Empire. See also Reinaud de Carlos IV, by Gen. J. Gomez de Arteche, in the Historia General de España, published by the R. Acad. de la Historia, Madrid, 1802, &c. There is a Notice historique sur le Chevalier d’Azara by Bourgoing (1804).

His younger brother, DON FELIX DE AZARA (1746–1811), spent twenty years in South America as a commissioner for delimiting the boundary between the Spanish and Portuguese territories. He made many observations on the natural history of the country, which, together with an account of the discovery and history of Paraguay and Rio de la Plata, were incorporated in his principal work, Voyage dans l’Amérique méridionale depuis 1781 jusqu’en 1801, published at Paris in 1809 in French from his MS. by C. A. Walckenaer.

AZARIAH, the name of several persons mentioned in the Old Testament. (1) One of Solomon’s “princes,” son of Zadok the priest (1 Kings iv. 2), was one of seven N. & Azarites among the descendants of Levi (1 Chron. vi. 9, 10, 13, 36; 2 Chron. xxvi. 17). (2) The son of Nathan, a high official under King Solomon (1 Kings iv. 5). (3) King of Judah, son of Amaziah by his wife Jecholiah (2 Kings xv. 1, 2), also called Uzziah (2 Chron. xxvi. 1). (4) Son of Ethan and great-grandson of Judah (1 Chron. ii. 8). (5) Son of Jehu, of the posterity of Judah (1 Chron. ii. 38). (6) A prophet in the reign of Asa, king of Judah (2 Chron. xv. 1). (7) Two sons of Jehoshaphat, king of Judah (2 Chron. xxi. 2). (8) King of Judah, also called Ahaziah and Jehoshaz, son of Jehoram (2 Chron. xxi. 17; xxii. 1, 6). (9) The son of Jeroham, and (10) the son of Obed, were made “captains of hundreds” by Jehoiada the priest (2 Chron. xxiii. 1). (11) Son of Hilkiah and grandfather of Ezra the Scribe (Ezra vii. 1; Neh. vii. 7, viii. 2). (12) Son of Masseiah, one of those who under the commission of Artaxerxes restored the wall of Jerusalem (Neh. iii. 23). (13) Son of Hoshiah, an opponent of the prophet Jeremiah (Jer. xii. 4). (14) One of the companions in captivity of the prophet Ezekiel, Overseer of the officers of his house, and with two companions he was cast into a “burning fiery furnace” for refusing to worship the golden image set up by that monarch (Dan. i. 6, iii. 8–30).

AZAY-LE-RIDEAU, a town of western France, in the department of Indre-et-Loire, on the Indre, 16 m. S.W. of Tours by rail. Pop. (1906) 14,53. The town has a fine Renaissance château, well restored in modern times, with good collections of furniture and pictures.

AZEGLIO, MASSIMO TAPARELLI, MARQUISE D’ (1798–1866), Italian statesman and author, was born at Turin in October 1798, descended from an ancient and noble Piedmontese family. His father, Cesare d’Azeglio, was an officer in the Piedmontese army and held a high position at court; on the return of Pope
Pius VII. to Rome after the fall of Napoleon, Cesare d’Azeglio was sent as special envoy to the Vatican, and he took his son, then sixteen years of age, with him as an extra attaché. Young Massimo was given a commission in a cavalry regiment, which he soon relinquished on account of his health. During his residence in Rome he had acquired a love for art and music, and he now determined to become a painter, to the horror of his family, who belonged to the stiff and narrow Piedmontese aristocracy. His father reluctantly consented, and Massimo settled in Rome, devoting himself to art. He led an abstemious life, maintaining himself by his painting for several years. But he was constantly meditating on the political state of Italy. In 1830 he returned to Turin, and after his father’s death in 1837 removed to Milan. There he remained for twelve years, moving in the literary and artistic circles of the city. He became the intimate of Alessandro Manzoni the novelist, whose daughter he married; thenceforth literature became his chief occupation instead of art, and he produced two historical novels, Niccolò dei Latii and Ettore Fieramosca, in imitation of Manzoni, and with pronounced political tendencies, his object being to point out the evils of foreign domination in Italy and to reawaken national feeling.

In 1845 he visited Romagna as an unauthorized political envoy, to report on its conditions and the troubles which he foresaw would break out on the death of Pope Gregory XVI. The following year he published his famous pamphlet Degli ultimi casi di Romagna at Florence, in consequence of which he was expelled from Tuscany. He spent the next few months in Rome, sharing the general enthusiasm over the supposed liberalism of the new pope, Pius IX.; like V. Gioberti and Balbo he believed in an Italian confederation under papal auspices, and was opposed to the Radical wing of the Liberal party. His political activity increased, and he wrote various other pamphlets, among which was I lotti di Lombardia (1848).

On the outbreak of the first war of independence, d’Azeglio donned the papal uniform and took part under General Durando in the defence of Vicenza, where he was severely wounded. He retired to Florence to recover, but as he opposed the democrats who ruled in Tuscany, he was expelled from that country for the second time. He was now a famous man, and early in 1849 Charles Albert, king of Sardinia, invited him to form a cabinet. But realizing how impossible it was to renew the campaign, and “not having the heart to sign, in such wretched internal and external conditions, a treaty of peace with Austria” (Correspondance politique, by E. Rendu), he refused. After the defeat of Novara (23rd of March 1849), Charles Albert abdicated and was succeeded by Victor Emmanuel II. D’Azeglio was again called on to form a cabinet, and this time, although the situation was even more difficult, he accepted, concluded a treaty of peace, dissolved the Chamber, and summoned a new one to ratify it. The treaty was accepted, and d’Azeglio continued in office for the next three years. While all the rest of Italy was a prey to despotism, in Piedmont the king maintained the constitution intact in the face of the general wave of reaction. D’Azeglio conducted the affairs of the country with tact and ability, impressing the nation with the relations and policies of that day on the Roman Curia. He invited Count Cavour, then a rising young politician, to enter the ministry in 1850. Cavour and Farini, also a member of the cabinet, made certain declarations in the Chamber (May 1852) which led the ministry in the direction of an alliance with Rattazzi and the Left. Of this d’Azeglio disapproved, and therefore resigned office, but on the king’s request he formed a new ministry, excluding both Cavour and Farini. In October, however, owing to ill-health and dissatisfaction with some of his colleagues, as well as for other reasons not quite clear, he resigned once more and retired into private life, suggesting Cavour to the king as his successor.

For the next four years he lived modestly at Turin, devoting himself once more to art, although he also continued to take an active interest in politics, Cavour always consulting him on matters of moment. In 1855 he was appointed director of the Turin art gallery. In 1856 he was given various political missions, including one to Paris and London to prepare the basis for a general congress of the powers on the Italian question. When war between Piedmont and Austria appeared inevitable he was sent to Rome, whence the papal troops had been expelled. After the peace of Villafranca, d’Azeglio was recalled with orders to withdraw the Piedmontese garrisons; but he saw the danger of allowing the papal troops to reoccupy the province, and after a severe inner struggle left Bologna without the troops, and interviewed the king. The latter approved of his action, and said that his orders had not been accurately expressed; thus Romagna was saved. That same year he published a pamphlet in French entitled De la Politique et du droit chrétien au point de vue de la question italienne, with the object of inducing Napoleon III. to continue his pro-Italian policy. Early in 1860 Cavour appointed him governor of Milan, evacuated by the Austrians after the battle of Magenta, a position which he held with great ability. But, disapproving of the government’s policy with regard to Garibaldi’s Sicilian expedition and the occupation by Piedmont of the kingdom of Naples as inopportun, he resigned office.

The death of his two brothers in 1862 and of Cavour in 1861 caused Massimo great grief, and he subsequently led a comparatively retired life. But he took part in politics, both as a deputy and a writer, his two chief subjects of interest being the Roman question and the relations of Piedmont (now the kingdom of Italy) with Mazzini and the other revolutionists. In his opinion Italy must be unified by means of the Franco-Piedmontese army alone, all connexion with the conspirators being eschewed, while the pope should enjoy nominal sovereignty over Rome, with full spiritual independence, the capital of Italy being established elsewhere, but the Romans being Italian citizens (see his letters to E. Rendu and his pamphlet Le questioni urgenti). He strongly disapproved of the convention of 1864 between the Italian government and the pope. The last few years of d’Azeglio’s life were spent chiefly at his villa of Cannero, where he set to work to write his own memoirs. He died of fever on the 15th of January 1866.

Massimo d’Azeglio was a very attractive personality, as well as an absolutely honest patriot, and a characteristic example of the best type of Piedmontese aristocrat. He was cautious and conservative; in his general ideas on the liberation of Italy he was wrong, and to some extent he was an amateur in politics, but of his sincerity there is no doubt. As an author his political writings are trenchant and clear, but his novels are somewhat heavy and old-fashioned, and are interesting only if one reads the political allusions between the lines.

Besides a variety of newspaper articles and pamphlets, d’Azeglio’s chief works are the two novels Ettore Fieramosca (1853) and Niccolò dei Latii (1841), and a volume of autobiographical memoirs entitled I Miei Ricordi, a most charming work published after his death, in 1866, but unfortunately incomplete. See in addition to the Ricordi, L. Carpi’s Il Risorgimento Italiano, vol. 1, pp. 288 sq., and the Souvenirs historiques de Constance d’Azeglio, Massimo’s niece (Turin, 1884).

(A. V.)*

AZERBAIJAN (also spelt ABDERJAN; the Azerbaidzhani of medieval writers, the Astrabadzhan and Astratapes of the ancients), a province and city on the rivers Araxes and Kaspian, is separated from Russian territory on the N. by the river Aras (Araxes), while it has the Caspian Sea, Gilan and Khamseh (Zenjan) on the E., Kurdistan on the S., and Asiatic Turkey on the W. Its area is estimated at 32,000 sq. m.; its population at 1,572,000, comprising various races, as Persians proper, Turks, Kurds, Syrians, Armenians, &c. The country is superior in fertility to most provinces of Persia, and consists of a regular succession of undulating eminences, partially cultivated and opening into extensive plains. Near the centre of the province the mountains of Sahand rise in an accumulated mass to the height of 12,000 ft. above the sea. The highest mountain of the province is in its eastern part, Mount Savalan, with an elevation of 15,702 ft., and the Talish Mountains, which run from north to south, parallel to and at no great distance from the Caspian, have an altitude of 9000 ft. The principal rivers are the Aras and Kizil Uzain, both receiving numerous tributaries and flowing into the Caspian, and the Jaghatu, Tatava, Murdi. Aji and others, which
AZIMUTH—AZO COMPOUNDS

AZO (c. 1150–1230), Italian jurist. This Azo, whose name is sometimes written Azzou and Azzolenus, and who is occasionally described as Azo Soldanus, from the surname of his father, is to be distinguished from two other famous Italians of the same name, viz. Azo Lambertaccius, a canonist of the 13th century, professor of canon law at the university of Bologna, author of Questiones in jus canonicum, and Azo de Ramenghis, a canonist of the 14th century, also a professor of canon law at Bologna, and author of Repetitio liber libri Decretorum. Few particulars are known as to the life of Azo, further than that he was born at Bologna about the middle of the 12th century, and was a pupil of Joannes Bassianus, and afterwards became professor of civil law in the university of his native town. He also took an active part in municipal life, Bologna, with the other Lombard cities, having gained its municipal independence. Azo occupied a very important position amongst the glossators, and his Readings on the Code, which were collected by his pupil, Alessandro de Santo Aegidio, and completed by the additions of Hugo Hulinus and Odofredus, form a methodical exposition of Roman law, and were of such weight before the tribunals that it was used to be said, “Chi non ha Azzo, non vada un palazzo.” Azo gained a great reputation as a professor, and numbered amongst his pupils Accursius and Jacobus Balduinus. He died about 1230.

AZO COMPOUNDS, organic substances of the type R-N-N'R' where R is an aryl radical and R' is a substituted alkyl, or aryl radical. They may be prepared by the reduction of nitro compounds in alkaline solution (using zinc dust and alkali, or a solution of an alkali stannite as a reducing agent); by oxidation of hydrazo compounds; or by the coupling of a diazotized amine and any compound of a phenolic or amine type, provided that there is a free para position in the amine or phenol. They may also be obtained by the molecular rearrangement of the diazoamines, when these are warmed with the parent compound and its hydrochloride. This latter method of formation has been studied by H. Goldschmidt and R. U. Reinders (Ber., 1896, 29, p. 1396), who found that the reaction is monomolecular, and that the velocity constant of the reaction is proportional to the amount of the hydrochloride of the base present and also to the temperature, but is independent of the concentration of the diazoamine. The azo compounds are intensely coloured, but are not capable of being used as dyestuffs unless they contain salt-forming, acid or basic groups (see DYEING). By oxidizing agents they are converted into azoxy compounds, and by reducing agents into hydrazone compounds or amines.

Azo-benzene, C6H5N-NC6H5, discovered by E. Mitscherlich in 1834, may be prepared by reducing nitrobenzene in alcoholic solution with zinc dust and caustic soda; by the condensation of nitrosobenzene with aniline in hot glacial acetic acid solution; or by the oxidation of aniline with sodium hypobromite. It crystallizes from alcohol in orange red plates which melt at 253° C. It does not react with acids or alkalies, but on reduction with zinc dust in acetic acid solution yields aniline.

Amino-azo Compounds may be prepared as shown above. They are usually yellowish brown or red in colour, the presence of more amino groups leading to browner shades, whilst the introduction of alkyd amino groups gives redder shades. They usually crystallize well and are readily reduced. When heated with aniline and aniline hydrochloride they yield indigines (q.v.). Amino-azo-benzene, C6H5-NH-N-C6H5, melts in yellow plates or needles and melts at 126° C. Its constitution is determined by the facts that it may be prepared by reducing nitro-azo-benzene by ammonium sulphide and that by reduction with stannous chloride it yields aniline and meta-phenylene diamine. Diamino-azo-benzene (chrysoidine), C6H4-NH-NH-C6H4, first prepared by O. Witt (Ber., 1877, 10, p. 656), is obtained by coupling phenyl diazonium chloride with meta-phenylene diamine. It crystallizes in red octahedra and dyest and wool yellow. Triamino-azo-benzene (meta-aminobenzene-azo-meta-phenylene diamine or Bismark brown, phenylene brown, vesuvine, Manchester brown), C6H4-NH-NH-NH-C6H4, is prepared by the action of nitrous acid on meta-phenylene diamine. It forms brown crystals which are readily soluble in hot water, and it dyes mordanted cotton a dark brown. On the composition of the commercial Bismark brown see E. Täuber and F. Walder (Ber., 1897, 30, pp. 2111, 2899; 1900, 33, p. 2116). Alkyld amino-azo-benzenes are also known, and are formed by the coupling of diazonium salts with alkylated amines, provided they contain a free para position with respect to the amino group. In these cases it has been shown by H. Goldschmidt and A. Mezr (Ber., 1897, 30, p. 679) that the velocity of formation of the amino-azo compound depends only on the nature of the reagents and not on the concentration, and that in coupling the hydrochloride of a tertiary amine with disozobenzene sulphonic acid the reaction takes place between the acid and the base set free by the hydrolytic dissociation of its salt, and is therefore afforded with the parent base, and when carried out in the presence of different acids, takes place most rapidly with the weakest acid (H. Goldschmidt and F. Buss, Ber., 1897, 30, p. 2075).

Methyl orange (helianthin, gold orange, Mandarin orange), (C6H5)3-N-C-H3, is the sodium salt of para-dimethylaminobenzene-azo-benzene sulphonic acid. It is an orange crystalline powder which is soluble in water, forming a yellow solution. The free acid is intensely red in colour. Methyl orange is used largely as an indicator. The constitution of methyl orange follows from the fact that on reduction by stannous chloride in hydrochloric acid solution it yields sulphonic acid and para-aminomethylindoline.

Oxyazo Compounds. — The oxyazo compounds are prepared by adding a solution of a diazonium salt to a cold slightly alkaline solution of a phenol. The diazo group takes up the para position...
AZOIMIDE

with regard to the hydroxyl group, and if this be prevented it then goes into the ortho position. It never goes directly into the meta position.

The constitution of the oxyazo compounds has attracted much attention, some chemists holding that they are true azophenols of the type R-N=N-R', whereas others look upon them as having a quinonoid structure, i.e., as being quinone hydrazones, type R-NH-N-R'. The first to attack the purely chemical side were Th. Zincke (Ber., 1883, p. 2929; 1884, 17, p. 3026; 1887, 20, p. 3171) and R. Meldola (Journ. Chem. Soc., 1880, 55, pp. 114, 603). Th. Zincke found that the products obtained by diazotizing a diazonium salt with α-naphthyl, and by condensing phenylhydrazine with α-naphthoquinone, were identical; whilst Meldola acetylated the azophenols, and split the acetyl products by reduction in acid solution, but obtained no satisfactory results. K. Auwers (Zeit. f. phys. Chem., 1896, 21, p. 355; Ber., 1900, 33, p. 1302) examined the question from the physical-chemical standpoint by determining the freezing-point depressions, the result being that the para-azoxy compounds give abnormal depressions and the ortho-azoxy compounds give normal depressions; Auwers then concluded that the para compounds are phenolic and the ortho compounds are quinone hydrazones or act as such. A. Hantzsch (Ber., 1899, 32, p. 596, 3069) considered the compounds formed to be pseudo-α-hydroxyacids, possessing in the free condition the configuration of quinone hydrazones, their salts, however, being of the normal phenolic type. J. T. Hewitt (Journ. Chem. Soc., 1900, 77, p. 99 et seq.) nitration para-azoxybenzene with dilute nitric acid and found that it gave a benzene-azo-ortho-nitrophenzol, whereas quinones are not attacked by dilute nitric acid. Hewitt has also attacked the problem by brominating the oxyazo-benzences, and has shown that when the hydrobromic acid produced in the reaction is allowed to remain in the system, a bromobenzene-azo-phenol is formed, whilst if it be removed (by the addition of sodium acetate) bromination takes place in the phenolic nucleus; consequently the presence of the mineral acid gives the azo compound a pseudo-quinonoid character, which it does not possess if the mineral acid be removed from the system of the reaction.

Para-azoxybenzene (benzene-azo-phenol), C₆H₅N-N(C-NH-C₆H₄-OH), is prepared by coupling diazotized aniline with phenol in alkaline solution. It is an orange-red crystalline compound which melts at 154°C. Ortho-azoxybenzene, C₆H₅:N(N-C₆H₄-OH), was obtained in small quantity by E. Bamberger (Ber., 1888, 31, p. 178) simultaneously with the pseudo-phenol, from which it may be separated by distillation in a current of steam, the ortho compound passing over with the steam. It crystallizes in orange-red needles which melt at 82-85°C. On reduction with zinc dust in dilute sulphamic acid solution, it yields ortho-anaminophenol and aniline.

Meta-azoxybenzene, C₆H₅:N(C₁₀H₈-NH-C₆H₄-OH), was obtained in 1903 by P. Jacobson (Ber., 1903, 36, p. 4003) by condensing ortho-anidine with diazo benzene, the resulting compound being then diazotized and reduced to acid benzamidoanisol, from which meta-azoxybenzene was obtained by hydrolysis with sodium hydroxide. It melts at 112-114°C and is easily reduced to the corresponding hydrazo compound.

Diazocyanides.—The diazo-amine, R-N=N-NHR, are obtained by the action of primary amines on diazonium salts; by the action of nitric acid on a free primary amine, an iso-diazoxyhydrazine being formed as an intermediate product which then condenses with the amine; and by the action of nitroamines on primary amines. They are crystalline solids, usually of a white or yellowish colour, which, with acids, they are readily converted into amino-azo compounds (see above), and are decomposed by the concentrated halogen acids, yielding haloid benzences, nitrogen and an amine. Acid anhydrides replace the imino-hydrogen atom by acyl radicals, and boiling with water converts them into phenols. They combine with phenyl isocyanate to form urea derivatives (H. Goldschmidt, Ber., 1888, 21, p. 2578), and on reduction with zinc dust (preferably in alcoholic acetic acid solution) they yield usually a hydrazine and an amine. Diazoximino benzene, C₆H₅:N=NHC₆H₃, was first obtained by P. Griess (Ann., 1862, 121, p. 258). It crystallizes in yellow lamellae, which melt at 96°C. and explode at slightly higher temperatures. It is readily soluble in alcohol, ether and benzene.

Diazoximino benzene, C₆H₅N=NH₂, is also known. It may be prepared by the action of ammonia on diazobenzene perbromide; by the action of hydroxylamine on a diazonium salt (K. Heumann and J. Oecolomides, Ber., 1887, 20, p. 372); and by the action of phenylhydrazine on a diazonium salt. It is a yellow oil which boils at 95°C. (12 mm.), and possesses a stupefying odour. It explodes when heated. Hydrotroporphic acid converts it into chloranilene, nitrogen being eliminated; whilst boiling sulphuric acid converts it into aminophenol.

Asoxy Compounds, R-N=N=O-N'R', are usually yellow or red crystalline solids which result from the reduction of nitro or nitroso compounds by heating them with alcoholic potash (preferably using methyl alcohol). They may also be obtained by the oxidation of azo compounds. When reduced (in acid solution) they yield amines, distillation with reduced iron gives azo compounds, and warming with ammonium sulphide gives hydrazo compounds. Concentrated sulphuric acid converts azoxybenzene into azoxybenzene (O. Wallach, Ber., 1886, 13, p. 575). Azoxybenzene, (C₆H₅N₃)₂O, crystallizes from alcohol in yellow needles, which melt at 16°C. On distillation, it yields aniline and azobenzene. Azoxybenzene is also found among the electro-reduction products of nitrobenzene, when the reduction is carried out in alcoholic-alkaline solution.

The mixed azo compounds are those in which the azo group -N=N- is united with an aromatic radical on the one hand, and with a radical of the aliphatic series on the other. The most easily obtained mixed azo compounds are those formed by the union of a diazonium salt with the potassium or sodium salt of a nitroaromatic (V. Meyer, Ber., 1875, 6, p. 384):

C₆H₄N₂=NO₂+CH₂=CH-CN=NO₂+K=NO₂+C₆H₅N₃+H₂O=C₆H₅N₃+CH₂=CH-CN=NO₂

Benzene-azo-nitro-ethane.

Those not containing a nitro group may be prepared by the oxidation of the corresponding mixed hydrazo compounds with mercuric oxide. E. Bamberger (Ber., 1898, 31, p. 455) has shown that the nitro-alkyl derivatives behave as though they possess the constitution of hydrazones, for on heating with dilute alkalies they split off or less readily into an azaldehyde and an acid hydrazide:

C₆H₅N₂+CH₂=CH-CN=NO₂+NaOH=NaN₃+C₆H₅-NH=CH-CN=NO₂

Benzene-azo-methane, C₆H₅-N=CH₂, is a yellow oil which boils at 150°C. and is readily volatile in steam. Benzene-azoethane, C₆H₅-N=CH₂, is a yellow oil which boils at 180°C. or more. On standing with 60% sulphuric acid for some time, it is converted into the isomeric acetaldehyde-phenylhydrazide, C₆H₅-N=CH-CN=NO₂.

The diazo cyanides, C₆H₅=N=CH-CN=O, and carboxylic acids, C₆H₅-N=CH-CN=O, may also be considered as mixed azo derivatives. Diazoximocyanoaldehyde, C₆H₅-N=CH-CN=O, is an unstable oil, formed when potassium cyanide is added to a solution of a diazonium salt. Phenyl-azo-carboxylic acid, C₆H₅-N=CH-CN=O, is obtained in the form of its potassium salt when phenylsemicarbazide is oxidized with potassium permanganate in alkaline solution (J. Thiele, Ber., 1895, 28, p. 2600). It crystallizes in orange-red needles and is decomposed by water. The corresponding amide, phenyl-azo-carbamidine, C₆H₅-NH=CH-CN=O, also results from the oxidation of phenylsemicarbazide (Thiele, loc. cit.), and forms reddish-yellow needles which melt at 114°C. When heated with benaldehyde to 120°C. it yields diphenylxylotriazole, (C₆H₅)₂C₆H₃-CN=O.

AZOIMIDE, or HYDRAZIC ACID, N₂H₄, a compound of nitrogen and hydrogen, first isolated in 1896 by Th. Curtius (Berichte, C, 90, 25, p. 502). It is the nitrogen component corresponding to P. Greiss' diazoximino benzene, which is obtained by the action of ammonia on diazobenzene perbromide.

Curtius found that benzyl glycyllic acid gavbenzoyl hydrazine with hydrazine hydrate:

C₆H₅CO-CH₂-COOH+2NH₂-H₂O=H₃O+CH₂-COOH+NH₂-NH₂-C₆H₅. COOH.
AZORES

(Ethyl benzoate may be employed instead of benzoyl glycolic acid for this reaction.) This compound gave a nitroso compound with nitrous acid, which changed spontaneously into benzyloazimide by loss of water:

\[ \text{C}_6\text{H}_5\text{CO-NH}_2+\text{HONO} \rightarrow \text{H}_2\text{O} + \text{C}_6\text{H}_5\text{CO-NH}_2 \]

The resulting benzyloazimide is easily hydrolysed by boiling with alcoholic solutions of caustic alkalis, a benzoate of the alkali metal and an alkali salt of the new acid being obtained; the latter is precipitated in crystalline condition on standing.

An improved method of preparation was found in the use of hippuric acid, which reacts with hydrate to form hippuryl hydrazine, \( \text{C}_6\text{H}_5\text{CONH}-\text{CH}_2\text{CONH-NH}_2 \), and this substance is converted by nitrous acid into diaz-hippuramide, \( \text{C}_6\text{H}_5\text{CONH}-\text{CH}_2\text{CO-NH-N}_2\text{-OH} \), which is hydrolysed by the action of caustic alkalis with the production of salts of hydrazoic acid. To obtain the free acid it is best to dissolve the diaz-hippuramide in dilute soda, warm the solution to ensure the formation of the sodium salt, and distil the resulting liquid with dilute sulphuric acid. The pure acid may be obtained by fractional distillation as a colourless liquid of very unpleasant smell, boiling at 30°C., and extremely explosive. It is soluble in water, and the solution dissolves many metals (zinc, iron, &c.) with liberation of hydrogen and formation of salts (azomides, azides or hydrazoates). All the salts are explosive and readily interact with the alkyl iodides. In its properties it shows some analogy to the halogen acids, since it forms difficultly soluble lead, silver and mercurous salts. The metallic salts all crystallize in the anhydrous condition and decompose on heating, leaving a residue of the pure acid. The acid is a "weak" acid, being ionized only to a very slight extent in dilute aqueous solution.

E. Noëting and E. Grandmougin (Berichte, 1891, 24 p. 2540) obtained azomide from dinitraniline, \( \text{C}_6\text{H}_5(\text{NO}_2)\text{-NH}_2 \), by diazotization and conversion of the diazo compound into the perchlorate \( \text{C}_6\text{H}_5\text{N}_2\text{ClO}_4 \). This compound is then decomposed by ammonia, dinitrophenyldrazoate being formed, which on hydrolysis with alcoholic potash gives potassium hydrazoate (azide) and dinitrophenol. The solution is then acidified and distilled, when azomide passes over. Somewhat later, they found that it could be prepared from diazo-benzene imide, provided a nitro group were present in the ortho or para position to the diazo group. The para-nitro compound is dropped slowly into a cold solution of one part of caustic potash in ten parts of absolute alcohol; the solution becomes dark red in colour, and is then warmed for two days on the water bath. After the greater portion of the alcohol has distilled off, the solution is acidified with sulphuric acid and the azomide distilled over. The yield obtained is only about 40% of that required by theory, on account of secondary reactions taking place. Ortho-nitro-diazobenzene imide only yields 30%.

W. Wislicenus (Berichte, 1892, 25 p. 2684) has prepared the sodium salt by passing nitrous oxide over sodamide at high temperatures. The acid can also be obtained by the action of nitrous acid on hydrazine sulphate; by the oxidation of hydrazine by hydrogen peroxide and sulphuric acid (A. W. Browne, J. Amer. Chem. Soc., 1905, 25 p. 251), or by ammonium metavanadate (A. W. Browne and F. F. Shetlerly, Abst. J.C.S., 1907, ii. p. 863).

Ammonium azomide, \( \text{N}_2\text{NH}_2 \), may be prepared by boiling dippuramide with alcoholic ammonia, until no more ammonia escapes, the following reaction taking place:

\[ \text{C}_6\text{H}_5\text{CO-NH}_2+\text{C}_6\text{H}_5\text{CONH}-\text{CH}_2\text{CONH-N}_2+2\text{H}_2\text{O} \rightarrow \text{N}_2\text{NH}_2+\text{H}_2\text{O} + \text{C}_6\text{H}_5\text{CO-NH-C}_6\text{H}_5\text{CONH} \]

The liquid is then allowed to stand for twelve hours, and the clear alcoholic solution is decanted from the precipitated hippurate. To the alcoholic solution, four times its volume of ether is added, when the ammonium salt is precipitated. It is then filtered, washed with ether, and air-dried. The salt is readily soluble in water, and is only feebly alkaline. It is extremely explosive. *Hip昭zeazide* azomide, \( \text{N}_2\text{NH}_2 \), is also known.

Chloroazomide, \( \text{Cl}_2\text{N}_2 \), the chloride corresponding to azomide, was obtained by F. Raschig (Ber., 1908, 41 p. 4194) as a highly explosive colourless gas on acidifying a mixture of sodium azide and hypochlorite with acetic or boric acid.

**AZORES** (Azores), or Western Islands, an archipelago in the Atlantic Ocean, belonging to the Kingdom of Portugal. Pop. (1900) 256,294; area, 922 sq. m. The Azores extend in an oblique line from N.W. to S.E., between 36° 55' and 39° 55' N., and between 25° and 32° 16' W. They are divided into three widely severed groups, rising from a depth of more than 2½ m. The south-eastern group consists of St Michael's (São Miguel) and St Mary (Santa María), with Formigas; the central, of

![AZORES Map](image-url)
undulating outline, with little or no tableland, and rising into peaks, of which the lowest, that of Corvo, is 350 ft., and the highest that of Pico, 762 ft. above sea-level. The lines of sea-coast are, with few exceptions, high and precipitous, with bases of accumulated masses of fallen rock, in which open bays, or scarcely more enclosed inlets, form the harbours of the trading towns. The volcanic character of the whole archipelago is obvious, and has been abundantly confirmed by the numerous earthquakes and eruptions which have taken place since its discovery. Basalt and scoria are the chief erupted materials. Hitherto Flores, Corvo and Graciosa have been quite exempt, and Fayal has only suffered from one eruption (1672). The centre of activity has for the most part been St Michael's, while the neighbouring island of St Mary has altogether escaped. In 1444-1445 there was a great eruption at St Michael's, of which, however, the accounts that have been preserved exaggerate the importance. In 1522 the town of Villa Franca, at that time the capital of the island, was buried, with all its 6,000 inhabitants, during a violent convulsion. In 1572 an eruption took place in Pico; in 1585 St George was the scene of numerous outbursts; and in 1614 a little town in Terceira was destroyed. In 1630, 1652, 1656, 1755, 1852, &c., St Michael's was visited with successive eruptions and earthquakes, several of them of great violence. During this period some of the subterranean eruptions have taken place, which have sometimes been accompanied by the appearance of temporary islands. Of these the most remarkable was thrown up in June 1811, about half a league from the western extremity of St Michael's. It was called Sabrina by the commander of the British man-of-war of that name, who witnessed the phenomenon.

Climate.—The climate is particularly temperate, but the extremes of sensible heat and cold are increased by the humidity. The range of the thermometer is from 45° Fahr., the lowest known extreme, or 48°, the ordinary lowest extreme of January, to 83°, the ordinary, or 86°, the highest known extreme of July, near the level of the sea. Between these two points (both taken in the shade) there is from month to month a regular gradation of increase or decrease, amounting to somewhat less than four degrees. In winter the prevailing winds are from the north-west, west and south; in summer the most frequent are the north, north-east and east. The weather is often extremely stormy, and the winds from the west and south-west render the navigation of the coasts very dangerous.

Fauna.—The mammals of this archipelago are limited to the rabbit, black, and brown rat, (brown and black), mouse and bat, in addition to domestic animals. The game includes the woodcock, red partridge (introduced in the 16th century), quail and snipe. Owing to the damage inflicted on the crops by the multitude of blackbirds, bullfinches, chaffinches and green canaries, a reward was formerly paid for the destruction of birds in St Michael's, and it is said that over 400,000 were destroyed in several successive years between 1875 and 1885. There are valuable fisheries of tuna, mullet and bonito. The porpoise, dolphin and whale are also common. Whale-fishing is a profitable industry, with its headquarters at Fayal, whence the sperm-oil is exported. Eels are found in the rivers. The only indigenous reptile is the lizard. Fresh-water molluscs are unknown, and near the coast the marine fauna is not rich; but terrestrial molluscs abound, several species being peculiar to the Azores.

Flora.—The general character of the flora is decidedly deciduous, fewer than 400 out of the 478 species generally considered as indigenous belonging likewise to that continent, while only four are found in America, and forty are peculiar to the archipelago. Vegetation in most of the islands is remarkably rich, especially in grasses, mosses, and ferns, heath, juniper, and a variety of shrubs. Of tall-growing trees there was, till the 10th century, an almost total lack; but the Bordeaux pine, European poplar, African palm-tree, Australian eucalyptus, chestnut, tulip-tree, elm, oak, and many others, were then successfully introduced. The orange, apricot, banana, lemon, citron, Japanese medlar, and pomegranate are the common fruits, and various other varieties are more or less cultivated. At one time much attention was given to the growing of sugar-cane, but it has now for the most part been abandoned. The culture of indigo, introduced in the 16th century, also belongs to the past. A kind of fern (Dicksonia caerulea), called by the natives cabellinho, furnishes a silky material for the stuffing of mattresses and is exported to Brazil and Portugal.

Population.—The inhabitants of the islands are mostly of Portuguese origin, with a well-marked strain of Moorish and Flemish blood. There is a high birth-rate and a low average of infant mortality. A large proportion of the poorer classes, especially among the older men and women, are totally illiterate, but education tends to spread more rapidly than in Portugal itself, owing to the custom of sending children to the United States, where they are taught in the state schools. Negroes, mulattoes, English, Scottish and Irish immigrants are present in considerable numbers, especially in Fayal and St Michael's. The total number of resident foreigners in 1900 was 1,400.

Government.—The Azores are subdivided into three administrative districts named after their chief towns, i.e. Ponta Delgada, the capital of St Michael's; Angra, or Angra do Heroismo, the capital of Terceira; and Horta, the capital of Fayal. St Michael's and St Mary are included in the district of Ponta Delgada; Terceira, St George and Graciosa, in that of Angra; also, Fayal, Flores and Corvo, in that of Horta. Four members are returned for Ponta Delgada, three for Angra, and one for each of the other districts. Besides the frequent and regular services of mails which connect the Azores with Portugal and other countries, there is a cable from Lisbon to Villa Franca do Campo, in St Michael's, and thence to Pico, Fayal, St George and Graciosa. Fayal is connected with Waterville, in Ireland, by a cable laid in 1901. At Angra and Ponta Delgada there are meteorological stations. The principal seaports are Angra (pop. 10,000, 10,788), Ponta Delgada (17,620), and Horta (6,754).

Trade.—The trade of the Azores, long a Portuguese monopoly, is now to a great extent shared by the United Kingdom and Germany, and is chiefly carried in British vessels. Textiles are imported from Portugal; coal from Great Britain; sugar from Germany, Madeira and the United States; stationery, hardware, chemicals, paints, oils, &c., from the United Kingdom and Germany. The exports consist chiefly of fruit, wine, natural indigo, mulattoes and paper. The trade in pineapples is especially important. No fewer than 400,000 pineapples were exported in 1902 and 1903, going in almost equal quantities to London and Hamburg. The fruit is raised under glass. Pottery, cotton fabrics, spirits, straw hats and tea are produced in the district of Ponta Delgada; linen and woollen goods, cheese, butter, soap, bricks and tiles, in that of Angra; baskets, mats, and various ornamental articles made from straw, osier, and the pith of dried fig-wood, in that of Horta.

The largest and most populous of the Azores is St Michael's, which has an area of 397 sq. m., and in 1900 had 121,340 inhabitants. Graciosa (pop. 8,385; area, 17 sq. m.) and St George (16,177; 40 sq. m.) form part of the central group. Graciosa is noteworthy for the beauty of its scenery. Its chief towns are Santa Cruz de Graciosa (2,345) and Guadalupe (2,177). The chief towns of St George are Ribeira Seca (2,517) and Velas (2,500).

History.—It does not appear that the ancient Greeks and Romans had any knowledge of the Azores, but from the number of Carthaginian coins discovered in Corvo it has been supposed that the islands must have been visited by that adventurous people. The Arabian geographers, Edrisi in the 12th century, and Ibn-al-Wardi in the 13th, describe, after the Canaries, nine other islands in the Western Ocean, which are in all probability the Azores. This identification is supported by various considerations. The number of islands is the same; the climate under which they are placed by the Arabian makes them north of the Canaries; and special mention is made of the hawks or buzzards, which were sufficiently numerous at a later period to
give rise to the present name (Port. Açor, a hawk). The Arabian writers represent them as having been populous, and as having contained cities of some magnitude; but they state that the inhabitants had been greatly reduced by intestine warfare. The Azores are first distinctively marked in a map of 1351, the southern group being named the Goat Islands (Cabras); the middle group, the Wind or Dove Islands (De Ventura sive de Columbia); and the western, the Brazil Island (De Brazil)—the word Brazil at that time being employed for any red dye-stuff. In a Catalan map of the year 1375 Corvo is found as Corvi Marini, and Flores as Li Conigi; while St George is already designated San Zorne. It has been conjectured that the discoverers were Genoese, but of this there is not sufficient evidence. It is plain, however, that the so-called Flemish discovery by van der Berg is only worthy of the name in a very secondary sense. According to the usual account, he was driven on the islands in 1432, and the news excited considerable interest at the court of Lisbon. The navigator, Gonzalo Velho Cabral—not to be confounded with his greater namesake, Pedro Alvarez Cabral—was sent to prosecute the discovery. Another version relates that Prince Henry, the founder of the Portuguese empire, was engaged in the search of a passage to India, and that he had sent Cabral to the islands in which the islands were laid down, and that he sent out Cabral through confidence in its accuracy. The map had been presented to him by his brother, Dom Pedro, who had travelled as far as Babylon. Be this as it may, Cabral reached the island, which he named Santa Maria, in 1432, and in 1444 took possession of St Michael's. The other islands were all discovered by 1457. Colonization had meanwhile been going on prosperously; and in 1466 Fayal was presented by Alphonso V. to his aunt, Isabella, the duchess of Burgundy. An influx of Flemish settlers followed, and the islands became known for a time as the Flemish Islands. From 1580 to 1640 they were subject, like the rest of the Portuguese kingdom, to Spain. At that time the Azores were the grand rendezvous for the fleets on their voyage home from the Indies; and hence they became a theatre of that maritime warfare which was carried on by the English under Queen Elizabeth against the Peninsular powers. One such expedition, which took place in 1591, led to the famous sea-fight off Flores, between the English ship "Revenge," commanded by Sir Richard Grenville, and a Spanish fleet of fifty-three vessels. Under the active administration of the marquis of Pombal (1699-1782), considerable efforts were made for the improvement of the Azores, but the stupid and bigoted government which followed rather tended to destroy these benefits. Towards the beginning of the 19th century, the possession of the islands, was contested by the claimants for the crown of Portugal. The adherents of the constitution, who supported against Miguel the rights of Maria (II) da Gloria, obtained possession of Terceira in 1829, where they succeeded in maintaining themselves, and after various struggles, Queen Maria's authority was established over all the islands. She resided at Angra from 1830 to 1833.

For a general account of the islands, see The Azores, by W. F. Walker (London, 1886), and Madeira and the Canary Islands, with the Azores, by S. B. Morewood (London, 1849). On the fauna of the islands, the following books by H. Drouet are useful:—Eléments de la faune actuelle (Paris, 1861); Mollusques marins des îles Açores (1858). Lettres Açoriennes (1862), and Catalogue de la flore des Açores, précédé de l'itinéraire d'une visite dans cet archipel (1866). The progress of Azorian commerce is best shown in the British and American consular reports. For history, see La Conquista de las Azores en 1583, by C. Fernandez Duro (Madrid, 1881), and Histoire de la découverte des îles Açores du Marquis de la dénomination d'îles flamandes, by J. Mees (Ghent, 1901).

AZOTH, the name given by the alchemists to mercury, and by Paracelsus to his universal remedy.

AZOTUS, the name given by Greek and Roman writers to Ashod, an ancient city of Palestine, now represented by a few remains in the little village of 'Esdud, in the governmental district of Acre. It was situated about 3 m. inland from the Mediterranean, on the famous military route between Syria and Egypt, about equidistant (18 m.) from Joppa and Gaza. As one of the five chief cities of the Philistines and the seat of the worship of Dagon (1 Sam. v.; cf. 1 Macc. x. 83), it maintained, down even to the days of the Maccabees, a vigorous though somewhat intermittent independence against the power of the Israelites, by whom it was nominally assigned to the territory of Judah. In 717 B.C. it was captured by the Assyrians (Is. xxi. 5), but soon regained its power, and was strong enough in the next century to resist the assaults of Psmemetichus, king of Egypt, for twenty-nine years (Herod. ii. 157). Restored by the Roman Gabinius from the ruins to which it had been reduced by the Jewish wars (1 Macc. v. 68, x. 77, xvi. 10), it was presented to Augustus by Salome, the sister of Herod. The only New Testament reference is in Acts viii. 40. Ashdod became the seat of a bishop early in the Christian era, but seems never to have attained any importance as a town. The Mount Azotus of 1 Macc. ix. 15, where Judas Maccabees fell, is possibly the rising ground on which the village stands. A fine Saracenic khan is the principal relic of antiquity at 'Esdud.

AZOV, or Asow (in Turkish, Aşak), a town of Russia, in the government of the Don Cossacks, on the left bank of the southern arm of the Don, about 20 m. from its mouth. The ancient Tanais lay some 10 m. to the north. In the 15th century the Genoese had a factory here which they called Tana. Azov was long a point of great strategic and commercial importance. Peter the Great obtained possession of it after a protracted siege in 1696, but in 1711 restored it to the Turks; in 1730 it was finally united to the Russian empire. Since then it has greatly declined, owing to the silting up of its harbour and the competition of Taganrog. Its population, principally engaged in the fisheries, numbered 25,124 in 1900.

AZOV, SEA OF, an inland sea of southern Europe, communicating with the Black Sea by the Strait of Yenikale, or Kerch, the ancient Bosporus Cimmerius. To the Romans it was known as the Palus Macoetis, from the name of the neighbouring people, who called it in their native language Temarenada, or Mother of Waters. It was long supposed to possess direct communication with the Northern Ocean. In prehistoric times a connexion with the Caspian Sea existed; but since the earliest historical times no great change has taken place in regard to the character or relations of the Sea of Azov. It lies between 43° 20' and 47° 18' N. lat., and between 35° and 39° E. long., its length from south-west to north-east being 230 m., and its greatest breadth 110. The area runs to 1,415 sq. m. It generally freezes from November to the middle of April. The Don is its largest and, indeed, its only very important affluent. Near the mouth of that river the depth of the sea varies from 3 to 10 ft., and the greatest depth does not exceed 45 ft. Of recent years, too, the level has been constantly dropping, for the surface lies 42 ft. higher than the surface of the Black Sea. Fierce and continuous winds from the east prevail during July and August, and in the latter part of the year those from the north-east and south-east are not unusual; a great variety of currents is thus produced. The water is for the most part comparatively fresh, but differs considerably in this respect according to locality and current. Fish are so abundant that the Turks describe it as Baluk-deniz, or Fish Sea. To the west, separated from the main basin by the long narrow sand-spit of Arabat, lie the remarkable lagoons and marshes known as the Sivash, or Putrid Sea; here the water is intensely salt. The Sea of Azov is of great importance to Russian commerce along its shores and the cities of Taganrog, Berdyansk, Mariupol, and Yenikale.

AZOXIMES (furo [a. b.] diazoles), a class of organic compounds which contain the ring system N-C=N=O. They may be prepared by converting nitriles into amidoximes by the action of hydroxyamine, the amidoximes so formed being then acylated by acid chlorides or anhydrides. From these acyl derivatives the elements of water are removed, either by simple heating or by boiling their aqueous solution; this elimination is accompanied by the formation of the azoxime ring. Thus

\[
\text{NH}_2\text{OH} \rightarrow \text{C}_6\text{H}_5\text{C} = \text{N} = \text{O} \rightarrow \text{C}_6\text{H}_5\text{N} = \text{C} = \text{N} \text{OH}
\]

boil with \[\text{proportion anhydride} \]

\[
\text{C}_6\text{H}_5\text{C} = \text{N} = \text{O} = \text{C} = \text{H}_5\text{N} \rightarrow \text{C}_6\text{H}_5\text{C} = \text{N} \rightarrow \text{O} \rightarrow \text{C}_6\text{H}_5\text{C}
\]
Azurites can also be produced from benzil dioxime by the "Beckmann" change. Most of the azoxines are very volatile substances, sublime readily, and are easily soluble in water, alcohol, and benzene.

For detailed descriptions, see F. Tiemann (Ber., 1885, 18, p. 1059), O. Schulz (Ber., 1885, 18, pp. 1084, 2459), and G. Müller (Ber., 1886, 19, p. 1492); also Annual Reports of the Chemical Society.

AZTECS (from the Nahua word aztlan, "place of the Heron," or "Heron people"); the native name of one of the tribes that occupied the tableland of Mexico on the arrival of the Spaniards in America. It has been very frequently employed as equivalent to the collective national title of Nahualectas or Mexicans. The Aztecs came, according to native tradition, from a country to which they gave the name of Aztlan, usually supposed to lie towards the north-west, but the satisfactory localization of it is one of the greatest difficulties in Mexican history. The date of the exodus from Aztlan is equally undetermined, being fixed by various authorities in the 11th and by others in the 12th century. One Mexican manuscript gives a date equivalent to A.D. 1164. They gradually increased their influence among other tribes, until, by union with the Toltecs, who occupied the tableland before them, they extended their empire to a region from 18,000 to 20,000 square leagues. The researches of Humboldt gave the first clear insight into the early periods of their history. See Mexico; Nahualectan stock.

AZUAGA, a town of western Spain, in the province of Badajoz, on the Belmez-Fuente del Arco railway. Pop. (1900) 14,192. Azuaga is the central market for the live-stock of the broad upland pastures watered by the Machtel, a left-hand tributary of the Guadiana, and by the Bembézar, a right-hand tributary of the Guadalquivir. Coarse woollen goods and pottery are manufactured in the town.

AZUAY (sometimes written ASSUYA), a province of Ecuador, bounded N. by the province of Casar, E. by Oriente, S. by Loja, and W. by El Oro. It was formerly called Cuenca, and formed part of the department of Azuay, which also included the province of Loja. Azuay is an elevated mountainous district with a great variety of climates and products; among the latter are silver, quicksilver, wheat, Indian corn, barley, cattle, wool, chincha and straw hats. The capital is Cuenca.

AZUNI, DOMENICO ALBERTO (1749-1827). Italian jurist, was born at Sassari, in Sardinia, in 1749. He studied law at Sassari and Turin, and in 1782 was made judge of the consultate at Nice. In 1786-1788 he published his Dizionario Universale Regionato della Giurisprudenza Meridionale. In 1793 appeared his systematic work on the maritime law of Europe, Sistema Universale dei Principi del Diritto Marittimo de l’Europa, which he afterward translated into French. In 1806 he was appointed one of the French commission engaged in drawing up a general code of commercial law, and in the following year he proceeded to Genoa as president of the court of appeal. After the fall of Napoleon in 1814, Azuni lived for a time in retirement at Genoa, till he was invited to Sardinia by Victor Emmanuel I., and appointed judge of the consultate at Cagliari, and director of the university library. He died at Cagliari in 1827. Azuni also wrote numerous pamphlets and minor works, chiefly on maritime law, an important treatise on the origin and progress of maritime law (Paris, 1810), and an historical, geographical and political account of Sardinia (1799, enlarged 1822).

AZURARA, GOMES EANNES DE (?-1474), the second notable Portuguese chronicler in order of date. He adopted the career of letters in middle life. He probably entered the royal library as assistant to Fernão Lopes (q.v.) during the reign of King Duarte (1433-1438), and he had sole charge of it in 1432. His Chronicle of the Siege and Capture of Ceuta, a supplement to the Chronicle of King John I., by Lopes, dates from 1430, and three years later he completed the first draft of the Chronicle of the Discovery and Conquest of Guinea, our authority for the early Portuguese voyages of discovery down the African coast and in the ocean, more especially for those undertaken under the auspices of Prince Henry the Navigator. It contains some account of the life work of that prince, and has a biographical as well as a geographical interest. On the 6th of June 1454 Azurara became chief keeper of the archives and royal chronicler in succession to Fernão Lopes. In 1456 King Alphonso V. commissioned him to write the History of Ceuta, "the land-gate of the East," under the governorship of D. Pedro de Menezes, from its capture in 1415 until 1437, and he had it ready in 1465. A year afterwards the king charged him with a history of the deeds of D. Duarte de Menezes, captain of Alcacer, and, proceeding to Africa, he spent a twelvemonth in the town collecting materials and studying the scenes of the events he was to describe, and in 1468 he completed the chronicle. Alphonso corresponded with Azurara on terms of affectionate intimacy, and no less than three commendas of the order of Christ rewarded his literary services. He has little of the picturesque ingenuity of Lopes, and loved to display his erudition by quotations and philosophical reflections, showing that he wrote under the influence of the first Renaissance. Nearly all the leading classical, early Christian and medieval writers figure in his pages, and he was acquainted with the notable chronicles and romances of Europe and had studied the best Italian and Spanish authors. In addition, he had mastered the geographical system of the ancients and their astrology. As an historian he is laborious, accurate and scientific, though his position did not allow him to tell the whole truth about events.

His works include: (1) Chronica del Rei D. Joao I. Terceira parte em que se contem a tomada de Ceuta (Lisbon, 1644); (2) Chronica del Descobrimento e Conquista de Guine (Paris, 1841; Eng. version in 2 vols. issued by the Hakluyt Society, London, 1896-1899); (3) Aztlan, a tribe, and of the name azurite, (given by F. S. Beudant in 1824) also has reference to the azurite-blue colour; the name chessylite, also in common use, is of later date (1853), and is from the locality, Chessyl, near Lyons, which has supplied the best crystallized specimens of the mineral. Crystals of azurite belong to a monoclinic system; they have a vitreous lustre and are translucent. The streak is blue, but lighter than the colour of the mineral in mass. Hardness 3½-4; sp. gr. 3.8.

Azurite occurs with malachite in the upper portions of deposits of copper ore, and owes its origin to the alteration of the sulphide or native copper by water containing carbon dioxide and oxygen. It is thus a common mineral in all copper mines, and sometimes occurs in large masses, as in Arizona and in South Australia, where it has been worked as an ore of copper, of which element it contains 55%. Being less hydrated than malachite it is itself liable to alteration into this mineral, and pseudomorphs of malachite after azurite are not uncommon. Occasionally the massive material is cut and polished for decorative purposes, though the application in this direction is far less extensive than that of malachite.

AZYMITES (Gr. αζυμημ, without; ίαμα, leaven), a name given by the Orthodox Eastern to the Western or Latin Church, because of the latter's use of unleavened bread in the Eucharist, a practice which arose in the 9th century and was followed by Armenians and Maronites following the Jewish passover custom. The Orthodox Church strenuously maintains its point, arguing that the very name bread, the holiness of the mystery, and the example of Jesus and the early church alike, testify against the use of unleavened bread in this connexion.
This letter corresponds to the second symbol in the Phoenician alphabet, and appears in the same position in all the European alphabets, except those derived, like the Russian, from medieval Greek, in which the pronunciation of this symbol had changed from b to w. A new form had therefore to be invented for the genuine b in Slavonic, to which there was, at the period when the alphabet was adopted, no corresponding sound in Greek. The new symbol, which occupies the second position, was made by removing the upper loop of B, thus producing a symbol somewhat resembling an ordinary lower-case b. The old B retained the numerical value of the Greek b as 2, and the numerical value was given to the new symbol. In the Phoenician alphabet the earliest forms are ֶ or more rounded ֶ. The rounded form appears also in the earliest Aramaic (see Alphabet). Like some other alphabetic symbols it was not borrowed by Greek in its original form. In the very early rock inscriptions of Thera (700-600 B.C.), written from right to left; it appears in a form resembling the ordinary Greek λ; this form apparently arose from writing the Semitic symbol upside down. Its form in inscriptions of Melos, Selinus, Syracuse, and elsewhere in the 6th and 5th centuries suggests the influence of Aramaic forms in which the head of the letter is opened, ֶ. The Corinthian Ἠ, Ὠ and ᾮ (also at Corcyra) and the Φ, Ψ of Byzantine coins are other adaptations of the same symbol. The form C which it takes in the alphabets of Naxos, Delos, and other Ionic islands at the same period is difficult to explain. Otherwise its only variation is between pointed and rounded loops (B and B). The sound which the symbol represents is the voiced stop made by closing the lips and vibrating the vocal chords (see Phonetics). It differs from p by the presence of vibration of the vocal chords and from m because the nasal passage as well as the lips is closed. When an audible emission of breath attends the production the aspirate bh is formed. This sound was frequent in the pro-ethnic period of the Indo-European languages and survived into the Indo-Aryan languages. According to the system of phonetic changes generally known as "Grimm's law," an original b appears in English as p, an original bh as b. An original medial p preceding the chief accent of the word also appears as b in English and the other members of the same group. It is not certain that any English word is descended from an original word beginning with b, though it has been suggested that peg is of the same origin as the Latin baculum and the Greek βαχτός. When the lips are not tightly closed the sound produced is not a stop, but a spirant like the English w. In Late Latin there was a tendency to this spirant pronunciation which appears as early as the beginning of the 2nd century A.D.; by the 3rd century b and consonantal w are inextricably confused. When this consonantal w (English w as seen in words borrowed very early from Latin like wall and wine) passed into the sound of English w (labio-dental) is not certain, but Germanic words borrowed into Latin in the 5th century A.D. have in their Latin representation gu- for Germanic w-, guί corresponding to English wise and reborrowed indirectly as guise.

The earliest form of the name of the symbol which we can reach is the Hebrew ב, to which the Phoenician must have been closely akin, as is shown by the Greek β, which is borrowed from it with a vowel affixed. (P. Gl.)

**BAADER, FRANZ XAVER VON** (1765-1841), German philosopher and theologian, born on the 27th of March 1765 at Munich, was the third son of F. P. Baader, court physician to the elector of Bavaria. His brothers were both distinguished—the elder, Clemens, as an author; the second, Joseph (1765-1833), as an engineer. Franz studied medicine at Ingolstadt and Vienna, and for a short time assisted his father in his practice. This life he soon found unengaging, and decided on becoming a mining engineer. He studied under Abraham Gottlob Werner at Freiberg, traveled through several of the mining districts in north Germany, and for four years, 1792-1796, resided in England. There he became acquainted with the works of Jakob Boehme, and with the ideas of Hume, Hartley and Godwin, which were extremely distasteful to him. The mystical speculations of Meister Eckhart, Saint Martin, and above all those of Boehme, were more in harmony with his mode of thought. In 1796 he returned from England, and in Hamburg became acquainted with F. H. Jacobi, with whom he was for years on terms of friendship. He now learned something of Schelling, and the works he published during this period were manifestly influenced by that philosopher. Yet Baader is no disciple of Schelling, and probably gave out more than he received. Their friendship continued till about the year 1822, when Baader's denunciation of modern philosophy in his letter to the emperor Alexander I. of Russia entirely alienated Schelling.

All this time Baader continued to apply himself to his profession of engineer. He gained a prize of 12,000 gulden (about £1,000) for his new method of employing Glauber's salts instead of potash in the making of glass. From 1817 to 1820 he held the post of superintendent of mines, and was raised to the rank of nobility for his services. He retired in 1820, and soon after published one of the best of his works, *Ferdinanda Cognitio, 6 parts, 1822-1825*, in which he combats modern philosophy and recommends the study of Boehme. In 1826, when the new university was opened at Munich, he was appointed professor of philosophy and speculative theology. Some of the lectures delivered there he published under the title, *Spekulative Dogmatik*, 4 parts, 1827-1836. In 1838 he opposed the interference in civil matters of the Roman Catholic Church, to which he belonged, and in consequence was, during the last three years of his life, interdicted from lecturing on the philosophy of religion. He died on the 23rd of May 1841.

It is difficult to summarize Baader's philosophy, for he himself generally gave expression to his deepest thoughts in obscure aphorisms, or mystical symbols and analogies (see Ed. Zeller's *Ges. d. deut. Phil.* 732, 736). Further, he has no systematic works; his doctrines exist for the most part in short detached essays, in comments on the writings of Boehme and Saint Martin, in his extensive correspondence and journals. At the same time there are salient points which mark the outline of his thought. Baader starts from the position that human reason by itself can never reach the truth, and he says that, as the understanding is the custodian of the presuppositions of faith, church and tradition. His point of view may be described as Scholasticism; for, like the scholastic doctors, he believes that theology and philosophy are not opposed sciences, but that reasoning has to be exercised within the framework of faith and revelation. But in his attempt to draw still closer the realms of faith and knowledge he approaches more nearly to the mysticism of Eckhart, Paracelsus and Boehme. Our existence depends on the fact that we are cognized by God (cogitatur ergo cogito et sum). All self-consciousness is at the same time God-consciousness; our knowledge is never mere scientia, it is invariably con scientia—a knowing with, consciousness of, or participation in God. Baader's philosophy is thus essentially a theosophy. God is not to be conceived as mere abstract Being (substantia), but as everlasting process, activity (actus). Of this process, this self-generation of God, we may distinguish two aspects—the immanent or esoteric, and the emmanent or exoteric. God has reality only in so far as He is absolute spirit, and only in so far as the primitive will is conscious of itself can it become spirit at all. But in this very cognition of self is involved the distinction of knower and known, from which proceeds the power to generate or create. This immanent process of self-consciousness, wherein indeed a trinity of persons is not given but only rendered possible, is mirrored in, and takes place through, the eternal and impersonal idea or wisdom of God, which exists beside, though not contrary to, the immanent process. The unchangeableness of the trinity is given to this divine Ternar, as Baader calls it, through nature, the principle of self-hood, of individual being, which is eternally and necessarily produced by God. Only in nature is the trinity of persons to be found. This phenomenon of process or activity is conceived as successive, or as taking place in time; they are to be looked at sub specie aternitatis, as the necessary elements or moments in the self-evolution of the divine Being. Nor is nature to be confounded with created substance, or with matter as it exists in space and time; it is pure non-being, the mere otherness (alteritas) of God—his shadow, desire, want, or desiderium sui, as it is called by mystical writers. Creation, itself a free and non-temporal act of God's love and will, cannot be speculatively deduced, but must be accepted as an historic
BAAL, a Semitic word, which primarily signifies lord, owner or inhabitant, and then, in accordance with the Semitic way of looking at family and religious relations, is specially appropriated to express the relation of a husband to his wife and of the deity to his worshippers. In the latter usage it indicated not that the god was the lord of the worshippers, but rather the possessor of, or ruler in, some place or district. In the Old Testament it is regularly written with the article, i.e. "the Baal"; and the baals of different tribes or sanctuaries were not necessarily conceived as identical, so that we find frequent mention of Baalim, or rather "the Baalim" in the plural. That the Israelites even applied the title of Baal to Yahweh himself is proved by the occurrence of such names as Jerubbaal (Gideon), Ebshaal (one of Saul's sons) and Beeliah (a son of David, 1 Chron. xiv. 7).

The last name appears in 2 Sam. v. 16 as Eliashib, that is, El-asherib ("Yahweh is generous or bountiful").

1 Cf. its use as a noun of relation, e.g. a ba'ul of hair, "a hairy man" (2 Kings i. 8), b. of wings, "a winged creature," and in the plural, b. of arrows, "archers" (Gen. xlix. 23), b. of oath, "conspirators" (Neh. vi. 19).

(God) was regarded as equivalent to Baal; cf. also the name B'el'iah, "Yahweh is ba'al or lord," which survives in 1 Chron. xi. 5. However, when the name Baal was exclusively appropriated to idolatrous worship (cf. Hos. ii. 16 seq.), abhorrence for the unholiness word was marked by writing bosheth (shameful thing) for ba'ul in compound proper names, and thus we get the usual forms Ishbosheth, Mephishbosheth.

The great difficulty which has been felt by investigators in determining the character and attributes of the god Baal mainly arises from the original appositive sense of the word, and many obscure points become clear if we remember that when a title becomes a proper name it may be appropriated by different peoples to quite distinct deities. Baal being originally a title, and not a proper name, the innumerable baals could be distinguished by the addition of the name of a place or of some special attribute. Accordingly, the baals are not to be regarded necessarily as local variations of one and the same god, like the many Virgins or Madonnas of Catholic lands, but as distinct gods. Each community could speak of its own baal, although a collection of allied communities might share the same cult, and naturally, since the attributes ascribed to the individual baals were very similar, subsequent syncretism was facilitated.

The Baal, as the head of each worshiping group, is the source of all the gifts of nature (cf. Hos. ii. 8 seq., Ezek. xvi. 19); as the god of fertility all the produce of the soil is his, and his adherents bring to him their tribute of first-fruits. He is the patron of all growth and fertility, and, by the "uncontrolled use of analogy characteristic of early thought," the Baal is the god of the productive element in its widest sense. Originating probably, in the observation of the fertilizing effect of rains and streams upon the receptive and reproductive soil, baalism becomes identical with the grossest nature-worship. Joined with the baals there there are naturally found corresponding female figures known as Ash'taroth, embodiments of Ash'toret (see Astar'at, Ish'tar). In accordance with primitive notions of analogy, we may assume that it is possible to control or aid the possession of nature by the practice of "sympathetic magic" (see Magic), the cult of the baals and Ash'taroth was characterized by gross sensuality and licentiousness. The fragmentary allusions to the cult of Baal Peor (Num. xxv., Hos. ix. 10, Ps. cvi. 28 seq.) exemplify the typical species of Dionysiac orgies that prevailed. On the summits of hills and mountains flourished the cult of the givers of increase, and "under every green tree" was practised the licentiousness which in primitive thought was held to secure abundance of crops (see Frazer, Golden Bough, 2nd ed. vol. ii. pp. 204 seq.).

Human sacrifice (Jer. xix. 3), the burning of incense (Jer. vii. 9), violent and ecstatic exercises, ceremonial acts of bowing and kissing, the preparing of sacred mystic cakes, appear among the offences denounced by the Israelite prophets, and show that the cult of Baal (and Astarte) included the characteristic features of heathen worship which recur in various parts of the Semitic world, although attached to other names.
the common source of all streams, and proceeding along this line it was possible for the numerous baals to be regarded eventually as manifestations of one absolute deity. Consequently, the Baal could be identified with some supreme power of nature, e.g. the heavens, the sun, the weather or some planet. The particular line of development would vary in different places, but the change from an association of the Baal with earthly objects to heavenly is characteristic of a higher type of belief and appears to be relatively later. The idea which has long prevailed that Baal was properly a sky-god affords no explanation of the local character of the many baals; on the other hand, on the theory of a higher development where the gods become heavenly or astral beings, the fact that ruder conceptions of nature were still retained (often in the unofficial but more popular forms of cult) is more intelligible.

A specific Baal of the heavens appears to have been known among the Hitites in the time of Rameses II, and considerably later, at the beginning of the 7th century, it was the title of one of the gods of Phoenicia. In Babylonia, from a very early period, Baal became a definite individual deity, and was identified with the planet Jupiter. This development is a mark of superior culture and may have been spread through Babylonian influence. Both Baal and Astarte were venerated in Egypt at Thebes and Memphis in the XIXth Dynasty, and the former, through the influence of the Aramaeans who borrowed the Babylonian spelling Bel, ultimately became known as the Greek Belos who was identified with Zeus.

Of the worship of the Tyrian Baal, who is also called Melkart (king of the city), and is often identified with the Greek Heracles, but sometimes with the Olympian Zeus, we have many accounts in ancient writers, from Herodotus downwards. He had magnificent temple in insular Tyre, founded by Hiram, to which gifts streamed from all countries, especially at the great feasts. The solar character of this deity appears especially in the annual feast of his birthday, which was at the winter solstice (Josephus, Ant. p. 18). At Tyre, as among the Hebrews, Baal had his symbolic pillars, one of gold and one of smaragdus, which, transported by phantasy to the farthest west, are still familiar to us as the Pillars of Hercules. The worship of the Tyrian Baal was carried to all the Phoenician colonies.1 His name occurs as an element in Carthaginian proper names (Hannibal, Hasdrubal, &c.), and a tablet found at Marseilles still survives to inform us of the charges made by the priests of the temple of Baal for offering sacrifices.

The history of Baalism among the Hebrews is obscured by the difficulty of determining whether the false worship which the prophets stigmatize is the heathen worship of Yahweh under a conception, and often with rites, which treated him as a local nature god; or whether Baalism was consciously recognized to be an alien cult opposed to the worship from the first. Later religious practice was undoubtedly opposed to that of earlier times, and attempts were made to correct narratives containing views which had come to be regarded as contrary to the true worship of Yahweh. The Old Testament depicts the history of the people as a series of acts of apostasy alternating with subsequent penitence and return to Yahweh, and the question whether this gives effect to actual conditions depends upon the precise character of the elements of Yahweh worship brought by the Israelites into Palestine. This is still under dispute. There is strong evidence at all events that many of the conceptions are contrary to historical fact, and the points of similarity between native Canaanite cult and Israelite worship are so striking that only the persistent traditions of Israel's origin and of the work of Moses compel the conclusion that the germs of specific Yahweh worship existed from his day. The earliest certain reaction against Baalism is ascribed to the reign of Ahab, whose marriage with Jezebel is not only the occasion but also the climax of a reaction against the cult. In honour of his wife's god, the king, following the example of Solomon, erected a temple to the Tyrian Baal (see above). This, however, did not prevent him from remaining a follower of Yahweh, whose prophets he still consulted, and whose protection he still cherished when he named his sons Ahaziah and Jehoram ("Yah[weh] holds," "Y. is high"). The antagonism of Elijah was not against Baalism in general, but against the introduction of a rival deity. But by the time of Hosea (i. 6 seq.) a further advance was marked, and the use of the term "Baal" was felt to be dangerous to true religion. Thus there gradually grew up a tendency to avoid the term, and in accordance with the idea of Ex. xxiii. 13, it was replaced by the contemptuous bō̂ṣeth, "shame" (see above). However, the books of Deuteronomy and Jeremiah (cf. also Zeph. i. 4) afford complete testimony for the prevalence of Baalism as late as the exile, but prove that the purest distinction was then drawn between the pure worship of Yahweh the god of Israel and the invertebrate and debased cults of the gods of the land. (See further Hebrew Religion; Prophets.)

BAALBEK (anc. Heliopolis), a town of the Buka'a (Coesarea), altitude 3830 ft., situated E. of the Litani and near the parting between its waters and those of the Asi. Pop. about 5000, including 2000 Metawali and 1000 Christians (Maronite and Orthodox). Since 1905 Baalbek has been connected by railway with Rayuk (Rejuk) on the Beirut-Damasus line, and since 1907 with Aleppo. It is famous for its temple ruins of the Roman period, before which we have no record of it, certain though it be that Heliopolis is a translation of an earlier native name, in which Baal was an element. It has been suggested, but without good reason, that this name was the Baalgid of JosH, xi. 17. Heliopolis was made a colonia probatori at 212 B.C. (coins of 1st century A.D.), and there must have been a Baal temple there in which Trajan consulted the oracle. The foundation of the present buildings, however, dates from Antoninus Pius, and their dedication from Septimius Severus, whose coins first show the two temples. The great courts of approach were not finished before the reigns of Caracalla and Philip. In commemoration, no doubt, of the dedication of the new sanctuaries, Severus conferred the juss Italicum on the city. The greater of the two temples was dedicated to Jupiter (Baal), identified with the Sun, with whom were associated Venus and Mercury as στυβομυος θεος. The lesser temple was built in honour of Bacchus (not the Sun, as formerly believed). Jupiter-Baal was represented locally as a beardless god in long scaly drapery, holding a whip in his right hand and lightning and ears of corn in his left. Two bulls were sacrificed to him. In this guise he passed into European worship in the 3rd and 4th centuries. Moreover, the Heliopolitan worship is often animadverted upon by early Christian writers, and Constantine, making an effort to curb the Venus cult, built a basilica. Theodosius erected another, with western apse, in the main court of the Jupiter temple.

When Abu Ubaid (or Obaid) attacked the place after the Moslem capture of Damascus (A.D. 635), it was still an opulent city and yielded a rich booty. It became a bone of contention between the various Syrian dynasties and the caliphs. In the 7th century, then of Egypt, and in 748 was sacked with great slaughter. In 990 it passed to the Seljuks, and in 1134 to Jenghiz Khan; but after 1145 it remained attached to Damascus and was captured by Saladin in 1177. The Crusaders raided its valley more than once, but never took the city. Three times shaken by earthquake in the 12th century, it was dismantled by Hulagu in 1260. But it revived, and most of its fine Moslem mosque and fortress architecture, still extant, belongs to the...
regime of Sultan Kalaün (1282) and the succeeding century, during which Abulfeda describes it as a very strong place. In 1400 Timur pillaged it, and in 1517 it passed, with the rest of Syria, to the Ottoman dominion. But Ottoman jurisdiction was merely nominal in the Lebanon district, and Baalbek was really in the hands of the Metawali (see Lebanon), who retained it against other Lebanon tribes, until "Jezzar" Pasha, the rebel governor of the Acre province, broke their power in the last half of the 18th century. The anarchy which succeeded his death in 1804 was only ended by the Egyptian occupation (1832). With the treaty of London (1840) Baalbek became really Ottoman, and since the settlement of the Lebanon (1864) has attracted great numbers of tourists.

The ruins were brought to European notice by Pierre Belon in 1555, though previously visited, in 1597, by Martin von Baumgarten. Much damaged by the earthquake of 1759, they remained a wilderness of fallen blocks till 1901, when their clearance was undertaken by the German Archaeological Institute and entrusted to the direction of Prof. O. Puchstein. They lie mainly on the ancient Acropolis, which has been shored up with huge walls to form a terrace raised on walls and measuring about 1000 ft. from E. to W. The Propyla or lie at the E. end, and were approached by a flight of steps now quarried away. These propyla formed a covered hall, or vestibule, about 35 ft. deep, flanked with towers richly decorated within and without (much damaged by Arab reconstruction). Columns stood in front, whose bases still exist and bear the names of Antonius Pius and Julia Domna. Hence, through a triple gateway in a richly ornamented screen, access is gained to the first or Hexagonal Court, which measures about 250 ft. from angle to angle. It is now raised almost to foundation level; but it can be seen that it was flanked with halls each having four columns in front. A portal on the W., 50 ft. wide, flanked by lesser ones 10 ft. wide (that on the N. is alone preserved), admitted to the Main Court, in whose centre was the High Altar of Burnt Sacrifice. This altar and a great tank on the N. were covered by the foundations of Theodosius' basilica and not seen till the recent German clearance. The Main Court measures about 440 ft. from E. to W. and 370 ft. from N. to S., thus measuring about 31 acres. It had a continuous fringe of covered halls of various dimensions and shapes, once richly adorned with statues and columnar screens. Some of these halls are in fair preservation. Stairs on the W. led up to the temple of Jupiter-Baal, now much ruined, having only 6 of the 54 columns of its peristyle erect. Three fell in the earthquake of 1759. Those still standing are Nos. 11 to 16 in the southern rank. Their bases and shafts are not finished, though the capitals and rich entablature seem completely worked. They have a height of 60 ft. and diameter of 72 ft., and are mostly formed of three blocks. The architrave is threefold and bears a frieze with lion-heads, on which rest a moulding and cornice. The temple of Bacchus stood on a platform of its own formed by a southern projection of the Acropolis. It was much smaller than the Jupiter temple, but is better preserved. The steps of the E. approach were intact up to 1688. The temple was peripteral with 46 columns in its peristyle. These were over 52 ft. in height and of the Corinthian order, and supported an entablature 7 ft. high with double frieze, connected with the cella walls by a coffered ceiling, which contained slabs with heads of gods and emperors. Richard Burton, when consul-general at Damascus in 1870, cleared an Arab screen out of the vestibule, and in consequence the exquisite doorway leading into the cela can now be well seen. On either side of it staircases constructed within columns lead to the roof. The cracked door-lintel, which shows an eagle on the soffit, was propped up first by Burton, and lately, more securely, by the Germans. The cela, now ruined, had inner wall-reliefs and engaged columns, which supported rich entablatures.

The vaults below the Great Court of the Jupiter Temple, together with the supporting walls of the terrace, are noticeable. In the W. wall of the latter occur the three famous megaliths, which gave the name Triliton to the Jupiter temple in Byzantine times. These measure from 63 to 64 ft. in length and 13 ft. in height and breadth, and have been raised 20 ft. above the ground. They are the largest blocks known to have been used in actual construction, but are excelled by another block still attached to its bed in the quaryes half a mile S.W. This is 68 ft. long by 14 ft. high and weighs about 1500 tons. For long these blocks were supposed, even by European visitors, to be relics of a primeval race of giant builders. In the town, below the Acropolis, on the S.E. is a small temple of the late imperial age, consisting of a semicircular cela with a peristyle of eight Corinthian columns, supporting a projecting entablature. The cela is decorated without a frieze, and within with pillars and arcing. This temple owes its preservation to its use as a church of St. Barbara, a local martyr, also claimed by the Egyptian Heliopolis. Hence the building is known as Barbarat al-atika. Considerable remains of the N. gate of the city have also been exposed.

BIBLIOGRAPHY.—These vast ruins, more imposing from their immensity than pleasing in detail, have been described by scores of travellers and tourists; but it will be sufficient here to refer to the following works:—(First discovery) M. von Baumgarten, "Griechische und römische Alterthümer in Syria" (1854); (second discovery) M. von Baumgarten, "Peregrinatio in Syria" (1857); (third discovery) M. von Baumgarten, "Baalbek" (1891). (Fourth discovery) O. Puchstein, "Baalbek" (1892). (Fifth discovery) O. Puchstein, Führer durch die Ruinen von Baalbek (1893), (with Th. v. Lübeck) "Anzichten" (1893). See also R. Phéné Spiers, "Quart. Journ. Archaeol. Inst. France" 1895, pp. 54-64, and the Builder, 11 Feb. 1905.

BAARN, a small town in the province of Utrecht, Holland, 5 m. by rail E. of Hilversum, at the junction of a branch line to Utrecht. Like Hilversum it is situated in the midst of picturesque and wooded surroundings, and is a favourite summer resort of people from Amsterdam. The Baarnsche Bosch, or wood, stretches southward to Soestdyk, where there is a royal country-
seat, originally acquired by the state in 1795. Louis Bonaparte, king of Holland, who was very fond of the spot, formed a zoological collection here which was removed to Amsterdam in 1809. In 1816 the estate was presented by the nation to the prince of Orange (afterwards King William II.) in recognition of his services at the battle of Quatre Bras. Since then the palace and grounds have been considerably enlarged and beautified. Close to Baarn in the south-west were formerly situated the ancient castles of Drakenburg and Drakensteijn, and at Vuursche there is a remarkable dolmen.

**BABADAG, or BABATAK, a town in the department of Tulcea, Rumania; situated on a small lake formed by the river Taitza among the densely wooded highlands of the northern Dobrudja. Pop. (1900) about 3500. The Taitza lake is divided only by a strip of marshland from Lake Razim, a broad landlocked sheet of water which opens on the Black Sea. Babadag is a market for the wool and mutton of the Dobrudja. It was founded by Bayezid I., sultan of the Turks from 1386 to 1403. It occasionally served as the winter headquarters of the Turks in their wars with Russia, and was bombarded by the Russians in 1854.**

**BABBAGE, CHARLES (1792–1871), English mathematician and mechanician, was born on the 26th of December 1792 at Teignmouth, where he was educated at the age of 13, and afterwards entered St Peter's College, Cambridge, where he graduated in 1814. Though he did not compete in the mathematical tripos, he acquired a great reputation at the university. In the years 1815–1817 he contributed three papers on the "Calculus of Functions" to the Philosophical Transactions, and in 1816 was made a fellow of the Royal Society. Along with Sir John Herschel and George Peacock he laboured to raise the standard of mathematical instruction in England, and especially endeavoured to supersede the Newtonian by the Leibnitzian notation in the infinitesimal calculus. Babbage's attention seems to have been very early drawn to the number and importance of the errors introduced into astronomical and other calculations through inaccuracies in the computation of tables. He contributed to the Royal Society some notices on the relation between notation and mechanism; and in 1822, in a letter to Sir H. Davy on the application of machinery to the calculation and printing of mathematical tables, he discussed the principles of a calculating engine, to the construction of which he devoted many years of his life. Governmental aid was not forthcoming, but he himself spent a portion of his private fortune in the prosecution of his undertaking. He travelled through several of the countries of Europe, examining different systems of machinery; and some of the results of his investigations were published in the admirable little work, *Economy of Machines and Manufactures* (1834). The great calculating engine was never completed; the constructor apparently desired to adopt a new principle when the first specimen was nearly complete, to make it not a difference but an analytical engine, and the government declined to accept the further risk (see Calculating Machines). From 1828 to 1839 Babbage was Lucasian professor of mathematics at Cambridge. He contributed largely to several scientific periodicals, and was instrumental in founding the Astronomical (1820) and Statistical (1834) Societies. He only once endeavoured to enter public life, when, in 1832, he stood unsuccessfully for the borough of Finsbury. During the later years of his life he resided in London, devoting himself to the construction of machines capable of performing arithmetical and even algebraical calculations. He died at London on the 19th of October 1871. He gives a few biographical details in *The Passages from the Life of a Philosopher* (1864), a work which throws considerable light upon his somewhat peculiar character. His works, pamphlets and papers were very numerous; in the *Passages* he enumerates eighty separate writings. Of these the most important, besides the few already mentioned, are *Tables of Logarithms* (1836); *Comparative View of the Various Institutions for the Assurance of Lives* (1836); *Decline of Science in England* (1830); *Ninth Bridgewater Treatise* (1837); *The Exposition of 1851* (1851). See Monthly Notices, Royal Astronomical Society, vol. 32.

**BABEL, the native name of the city called Babylon (q.v.) by the Greeks, the modern Hillah. It means "gate of the god;" not "gate of the gods," corresponding to the Assyrian Bab-il. According to Gen. xi. 1-9 (J), mankind, after the deluge, travelled from the mountain of the East, where the ark had rested, and settled in Shinar. Here they attempted to build a city and a tower whose top might reach unto heaven, but were miraculously prevented by their language being confounded. In this way the diversity of human speech and the dispersion of mankind were accounted for; and in Gen. x. 10 it is said to have formed part of the kingdom of Nimrod. The origin of the story has not been found in Babylonia. The tower was no doubt suggested by one of the temple towers of Babylon. W. A. Benet (Genesis, p. 169; cf. Hommel in Hasting's Dictionary of the Bible) suggests E-Saggila, the great temple of Merodach (Marduk). The variety of languages and the dispersion of mankind were regarded as a curse, and it is probable that, as Prof. Cheyne (Encyclopaedia Biblica, col. 411) says, there was an ancient North Semitic myth to explain it. The event was afterwards localized in Babylonia. The myth, as it appears from the later writers, connects itself with the myth of Ninurta, according to Cornelius Alexander (frag. 10) and Abdybenos ( frags. 26, 27). The tower was overthrown by the winds; according to Yaqut (i. 448 f.) and the Lisan el-Árab (xii. 72) mankind were swept together by winds into the plain afterwards called "Babil," and were scattered again in the same way (see further D. B. Macdonald in the Jewish Encyclopedia). A tradition similar to that of the tower of Babel is found in Central America. Xelhua, one of the seven giants rescued from the deluge, built the great pyramid of Cholula in order to storm heaven. The gods, however, destroyed it with fire and confounded the language of the builders. Traces of a somewhat similar story have also been met with among the Mongolian Tharus in northern India (Report of the Census of Bengal, 1872, p. 160), and, according to Dr Livingstone, among the Africans of Lake Ngami. The Estonian myth of the Cooking of Languages (Kohl, Reisen in die Ostseeprovinzen, ii. 231-233) may also be compared, as well as the Australian legend of the origin of the diversity of speech (Gerstäcker, Reisen, vol. iv. pp. 381 seq.). **BABEI, or Babai, is a place on the river Babi, which branches off the Gates of Babi, the strait between Arabia and Africa which connects the Red Sea (q.v.) with the Indian Ocean. It derives its name from the dangers attending its navigation, or, according to an Arabic legend, from the numbers who were drowned by the earthquake which separated Asia and Africa. The distance across is about 20 m. from Ras Menbeli on the Arabian coast to Ras Siyan on the African. The island of Perim (q.v.), a British possession, divides the strait into two channels, of which the eastern, known as the Bab Iskender (Alexander's Strait), is 2 m. wide and 16 fathoms deep, while the western, or Dact-el-Mayun, has a width of about 16 m. and a depth of 170 fathoms. Near the African coast lies a group of smaller islands known as the "Seven Brothers." There is a surface current inwards in the eastern channel, but a strong under-current outwards in the western channel.**

**BABENBERG, the name of a Franconian family which held the duchy of Austria before the rise of the house of Habsburg. Its earliest known ancestor was one Poppo, who early in the 9th century was count in Grapfeld. One of his sons, Henry, called margrave and duke in Franconia, fell fighting against the Normans in 886; another, Poppo, was margrave in Thuringia (903); but in 904 he was deposed by the German king Arnulf, who afterwards descended the Babenberg line. The family had been favoured by the emperor Charles the Fat, but Arnulf reversed this policy in favour of the rival family of the Conradines. The leaders of the Babenberges were the three sons of Duke Henry, who called themselves after their castle of Babenberg on the upper Main, round which their possessions centred. The rivalry between the two families was intensified by their efforts to extend their authority in the region of the middle Main, and this quarrel, known as the Babenberg feud," came to a head at the beginning of the 10th century during the
BABER, or Baber (1483-1530), a famous conqueror of India and founder of the so-called Mogul dynasty. His name was Zahir ud-din-Mahomet, and he was given the surname of Baber, meaning the tiger. Born on the 14th of February 1483, he was a descendant of Timur, and his father, Omar Sheik, was king of Ferghana, a district of what is now Russian Turkestam. Omar died in 1405, and Baber, though only twelve years of age, succeeded to the throne. An attempt made by his uncle to dislodge him proved unsuccessful, and no sooner was the young sovereign firmly settled than he began to meditate an extension of his own dominions. In 1497 he attacked and gained possession of Samarkand, to which he always seems to have thought he had a natural and hereditary right. A rebellion among his nobles robbed him of his native kingdom, and while marching to recover it his troops deserted him, and he lost Samarkand also. After some reverses he regained both these places, but in 1501 his most formidable enemy, Shaibani (Sheibani) Khan, ruler of the Uzbegs, defeated him in a great engagement and drove him from Samarkand. For three years he wandered about trying in vain to recover his lost possessions; at last, in 1504, he gathered some troops, and crossing the snows of Hindustan besieged and captured the strong city of Kabul. By this dexterous stroke he gained a new and wealthy kingdom, and completely re-established his fortunes. In the following year he united with Hussen Mirza of Herat against Shaibani. The death of Hussain put a stop to this expedition, but Baber spent a year at Herat, enjoying the pleasures of that capital. He returned to Kabul in time to quell a formidable rebellion, but two years later a revolt among some of the leading Moguls drove him from his city. He was compelled to take to flight with very few companions, but his great personal courage and daring struck the army of his opponents with such dismay that they again returned to their allegiance and Baber regained his kingdom. Once again, in 1510, after the death of Shaibani, he endeavoured to obtain possession of his native country. He received considerable aid from Shah Ismael of Persia, and in 1511 made a triumphal entry into Samarkand. But in 1514 he was again defeated by the Uzbegs and with difficulty reached Kabul. He seems now to have resigned all hopes of recovering Ferghana, and as he at the same time dreaded an invasion of the Uzbegs from the west, his attention was more and more drawn towards India. Several preliminary incursions had already been made, and in 1521 an opportunity presented itself for a more extended expedition. Ibrahim, emperor of Delhi, had made himself detested, even by his Afghan nobles, several of whom called upon Baber for assistance. He at once assembled his forces, 12,000 strong, with some pieces of artillery and marched into India. Ibrahim, with 100,000 soldiers and numerous elephants, advanced against him. The great battle was fought at Panipat on the 21st of April 1526, when Ibrahim was slain and his army routed. Baber at once took possession of Agra. A still more formidable enemy awaited him; the Rana Sanga of Mewar collected the enormous force of 210,000 men, with which he moved against the invaders. On all sides there was danger and revolution, but Baber's own son, worn out with the heat of this new climate, longed for Kabul. By vigorous measures and inspiring speeches he restored their courage, though his own heart was nearly failing him, and in his distress he abandoned the use of wine, to which he had been addicted. At Kanwaha, on the 10th of March 1527, he won a great victory and made himself absolute master of northern India. The remaining years of his life he spent in arranging the affairs and revenues of his new empire and in improving his capital, Agra. He died on the 26th of December 1530 in his forty-eighth year. Baber was above the middle height, of great strength and an admirable archer and swordsman. His mind was as well cultivated as his bodily powers; he wrote well, and his observations are generally acute and accurate; he was brave, kindly and generous.

Full materials for his life are found in his Memoirs, written by himself (translated into English by Leyden and Erskine (London, 1826); abridged in Caldecott, Life of Baber (London, 1844). See also Lane-Poole, Baber (Rulers of India Series, 1899).
Babeuf, François Noel (1760-1797), known as Gracchus Babeuf, French political agitator and journalist, was born at Saint Quentin on the 23rd of November 1760. His father, Claude Babeuf, had deserted the French army in 1728 and taken service under Maria Theresa, rising, it is said, to the rank of major. Amnestied in 1755 he returned to France, but soon sank into dire poverty, being forced to earn a pittance for his wife and family as a day labourer. The hardships endured by Babeuf during early years do much to explain his later opinions. He had received from his father the smatterings of a liberal education, but until the outbreak of the Revolution he was a domestic servant, and from 1785 occupied the invidious office of commissaire à terrier, his function being to assist the nobles and priests in the assertion of their feudal rights as against the unfortunate peasants. On the eve of the Revolution Babeuf was in the employ of a land surveyor at Roye. His father had died in 1780, and he was now the sole support, not only of his wife and two children, but of his mother, brothers and sisters.

In the circumstances it is not surprising that he was the life and soul of the malcontents of the place. He was an indefatigable writer, and the first germ of his future socialism is contained in a letter of the 21st of March 1787, one of a series—mainly on literature—addressed to the secretary of the Academy of Arras. In 1789 he drew up the first article of the cahier of the electors of the baillage of Roye, demanding the abolition of the feudal rights. Then, from July to October, he was in Paris superintending the publication of his first work: Cadastre perpétuel, dédié à l'assemblée nationale, l'an 1789 et le premier de la liberté française, which was written in 1789 and issued in 1790. The same year he published a pamphlet against feudal aids and the gabelle, for which he was denounced and arrested, but provisionally released. In October, on his return to Roye, he founded the Correspondant picard, the violent character of which cost him another arrest. In November he was elected a member of the municipality of Roye, but was expelled. In March 1791 he was appointed commissioner to report on the national property (biens nationaux) in the town, and in September 1792 was elected a member of the council-general of the department of the Somme.

Here, as everywhere, the violence of his attitude made his position intolerable to himself and others, and he was soon transferred to the post of administrator of the district of Montdidier. Here he was accused of fraud for having substituted one name for another in a deed of transfer of national lands. It is probable that his fault was one of negligence only; but, distrusting the impartiality of the judges of the Somme, he fled to Paris, and on the 3rd of August 1793 was sentenced in the Convention to twenty years of imprisonment. Meanwhile he had been appointed secretary to the relief committee (comité des subsistances) of the commune of Paris. The judges of Amiens, however, pursued him with a warrant for his arrest, which took place in Bruaine of the year II. (1794). The court of cassation quashed the sentence, through defect of form, but sent Babeuf for a new trial before the Aisne tribunal, by which he was acquitted on the 18th of July.

Babeuf now returned to Paris, and on the 3rd of September 1794 published the first number of his Journal de la liberté de la presse, the title of which was altered on the 5th of October to Le Tribun du peuple. The execution of Robespierre on the 28th of July had ended the Terror, and Babeuf—now self-styled “Gracchus” Babeuf—defended the men of Thermidor and attacked the fallen terrorists with his usual violence. But he also attacked, from the point of view of his own socialist theories, the economic outcome of the Revolution. This was an attitude which had few supporters, even in the Jacobin club, and in October Babeuf was arrested and sent to prison at Arras. Here he came under the influence of certain terrorist prisoners, notably of Lebois, editor of the Journal de l’égalité, and friends of the Ami du peuple, papers which carried on the traditions of Marat. He emerged from prison a confirmed terrorist and convinced that his Utopia, fully proclaimed to the world in No. 33 of his Tribun, could only be realized through the restoration of the constitution of 1793.

It was the attempts of the Directory to deal with this economic crisis that gave Babeuf his real historic importance. The new government was pledged to abolish the vicious system by which Paris was fed at the expense of all France, and the cessation of the distribution of bread and meat at nominal prices was fixed for the 20th of February 1796. The announcement caused the most wide-spread consternation. Not only the workmen and the large class of idlers attracted to Paris by the system, but rentiers and government officials, whose incomes were paid in assignats on a scale arbitrarily fixed by the government, saw themselves threatened with actual starvation.

The government yielded to the outcry that arose; but the expedients by which it sought to mitigate the evil, notably the division of those entitled to relief into classes, only increased the alarm and the discontent. The universal misery gave point to the virulent attacks of Babeuf on the existing order, and at last gained him recognition. He got formed round him a small circle of his immediate followers known as the Société des Égards, soon merged with the rump of the Jacobins, who met at the Pantheon; and in November 1795 he was reported by the police to be openly preaching “insurrection, revolt and the constitution of 1793”.

For a time the government, while keeping itself informed of his activities, left him alone; for it suited the Directory to let the socialist agitation continue, in order to frighten the people from joining in any royalist movement for the overthrow of the existing régime. Moreover the mass of the ouvriers, even of extreme views, were repelled by Babeuf’s bloodthirstiness; and the police agents reported that his agitation was making many converts—for the government. The Jacobin club of the Faubourg Saint-Antoine refused to admit Babeuf and Lebois, on the ground that they were “égorgeurs.” With the development of the economic crisis, however, Babeuf’s influence increased. After the club of the Pantheon was closed by Bonaparte, on the 27th of February 1796, his aggressive activity redoubled. In Ventôse and Germinal he published, under the nom de plume of Lalande, soldat de la patrie,” a new paper, the Éclairer du peuple, which was moderately successful. Its opponents, which were spiked clandestinely from group to group in the streets of Paris. At the same time No. 40 of the Tribun excited an immense sensation. In this he praised the authors of the September massacres as “deserving well of their country,” and declared that a more complete “September 2nd” was needed to annihilate the actual government, which consisted of “starvers, blood-suckers, tyrants, hangmen, rogues and mountebanks.”

The distress among all classes continued to be appalling; and in March the attempt of the Directory to replace the assignats (q.v.) by a new issue of mandats created fresh dissatisfaction after the breakdown of the hopes first raised. A cry went up that national bankruptcy had been declared, and thousands of the lower class of ouvrier began to rally to Babeuf’s flag. On the 4th of April it was reported to the government that 500,000 people in Paris were in need of relief. From the 11th Paris was placarded with posters headed Analyse de la doctrine de Babeuf (sic), tribun du peuple, of which the opening sentence ran: “Nature has given to every man the right to the enjoyment of an equal share in all property,” and which ended with a call to restore the constitution of 1793. Babeuf’s song Mournant de faim, mourant, set to a popular air, began to be sung in the cafés, with immense applause; and reports were current that the disaffected troops in the camp of Grenelle were ready to join an émeute against the government. The Directory thought it time to act; the bureau central had accumulated through its agents, notably the ex-capitan Georges
Grisel, who had been initiated into Babeuf's society, complete evidence of a conspiracy for an armed rising fixed for Floréal 22, year IV. (11th of May 1796), in which Jacobins and socialists were combined. On the 10th of May Babeuf was arrested with many of his associates, among whom were A. Darthé and P. M. Buonarroti, the ex-members of the Convention, Robert Lindet, J. A. B. Amar, M. G. A. Vadier and Jean Baptiste Drouet, famous as the postmaster of Saint-Menehould who had arrested Louis XVI., and now a member of the Council of Five Hundred.

The coup was perfectly successful. The last number of the Tribun appeared on the 24th of April, but Lebois in the Ami du peuple tried to incite the soldiers to revolt, and for a while there were rumours of a military rising. The trial of Babeuf and his accomplices was fixed to take place before the newly constituted high court of justice at Vendôme. On Fructidor 10 and 11 (27th and 28th of August), when the prisoners were removed from Paris, there were tentative efforts at a riot with a view to rescue, but these were easily suppressed. The attempt of five or six hundred Jacobins (7th of September) to rouse the soldiers at Grenelle met with no better success. The trial of Babeuf and the others, begun at Vendôme on the 20th of February 1797, lasted two months. The government for reasons of their own made the search of the Babis, the most important people than he was implicated; and his own vanity played admirably into their hands. On Prairial 7 (26th of April 1797) Babeuf and Darthé were condemned to death; some of the prisoners, including Buonarroti, were exiled; the rest, including Vadier and his fellow-conspirators, were acquitted. Drouet had succeeded in making his escape, according to Barras, with the connivance of the Directory. Babeuf and Darthé were executed at Vendôme on Prairial 8 (1797).

Babeuf's character has perhaps been sufficiently indicated above. He was a type of the French revolutionists, excitable, warm-hearted, half-educated, who lost their mental and moral balance in the chaos of the revolutionary period. Historically, his importance lies in the fact that he was the first to propound socialism as a practical policy, and the father of the movements which played so considerable a part in the revolutions of 1848 and 1871.

Buonarroti, Conspiration pour l'égalité, dite de Babeuf (2 vols., Brussels, 1828; later editions, 1850 and 1860); English translation by Brontero O'Brien (London, 1830); Cambridge Modern History, vol. vii.; Adolf Schmidt, Pariser Zustände während der Revolution von 1793-1800 (Jena, 1874); and the work of F. Voellet, Paris pendant la Révolution d'après les rapports de la police secrète, 1789-1800 (4 vols., 1880-1894); A. Schmidt, Tableaux de la Révolution française, &c. (Leipzig, 1867-1870), a collection of reports of the secret police on which the above work is based. A full report of the trial at Vendôme was published in four volumes at Paris in 1797, Débats du procès, &c. (W. A. P.)

BÁBIISM, the religion founded in Persia in A.D. 1844—1845 by Mírzá 'Ali Muhammad of Shiráz, a young Sayyid who was at that time not twenty-five years of age. Before his "manifestation" (zuhur), of which he gives in the Persian Baydün a date corresponding to 23rd May 1844, he was a disciple of Sayyid Kájim of Rasht, the leader of the Šaykhís, a sect of extreme Shi'ites characterized by the doctrine (called by them Ruhni-ri'bi, "the fourth support") that at all times there must exist an intermediary between the twelfth Imám and his faithful followers. This intermediary they called "the perfect Shí'ite" and his protégé and successor as Báb or "ra'ís" (leader) through whom alone the twelfth Imám, during the period of his "minor occultation" (Ghaybat-i-zuhuréd, A.D. 874-940), held communication with his partisans. It was in this sense and not, as has been often asserted, in the sense of "Gate of God" or "Gate of Religion," that the title Báb was understood and assumed by Mírzá 'Ali Muhammad; but, though still generally thus styled by non-Bábís, he soon assumed the higher title of Nīqāt ("Point"), and the title Báb, thus left vacant, was conferred on his ardent disciple, Mullâ Husayn of Bushirwayh.

The history of the Bábís, though covering a comparatively short period, is so full of incident and the particulars now available are so numerous, that the following account purports to be only the briefest sketch. The Báb himself was in captivity first at Shiráz, then at Makká, and lastly at Chihriq, during the greater part of the six years (May 1844 until July 1850) of his brief career, but an active propaganda was carried on by his disciples, which resulted in several serious revolts against the government, especially after the death of Muhammad Sháh in September 1848. Of these risings the first (December 1848—July 1849) took place in Mázandarán, at the ruined shrine of Shaykh Tabarsí, near Bârbûrûsh, where the Bábís, led by Mullâ Muhammad 'Ali of Bârûrûsh and Mullâ Husayn of Bushirwayh ("the first who believed"), defied the sháh's troops for seven months before they were finally subdued and put to death. The revolt at Zanjáín in the north-west of Persia, headed by Mullâ Muhammad 'Ali Zanjâni, also lasted seven or eight months (May—December 1850), while a serious but less protracted struggle was waged against the government at Nîrîz in Fârs by Agá Sayyid Yahyâ of Nîrîz. Both revolts were in progress when the Báb, with one of his devoted disciples, was brought from his prison at Chihriq to Tabarsí and publicly shot in front of the arg or citadel. The body, after being exposed for some days, was recovered by the Bábís and conveyed to a shrine near Tehran, whence it was ultimately removed, as a Syriac inscription of the capture of the body in the next two years comparatively little was heard of the Bábís, but on the 15th of August 1852 three of them, acting on their own initiative, attempted to assassinate Nîsîrîd-Dîn Shâh as he was returning from the chase to his palace at Neyâvarán. The attempt failed, but was the cause of a fresh persecution, and on the 31st of August 1852 some thirty Bábís, including the beautiful and talented poetess Qurartâl'-Ayn, were put to death in Tehran with atrocious cruelty. Another of the victims of that day was Hâjjî Mírzá Jânî of Kâshân, the author of the oldest history of the movement from the Bábí point of view. Only one complete MS. of his invaluable work (obtained by Count Gobineau in Persia) exists in any public library, the Bibliothèque Nationale at Paris. The so-called "New History" (of which an English translation was published at Cambridge in 1893 by E. G. Browne) is based on Mírzá Jánî's work, but many important passages which did not accord with later Bábí doctrine or policy have been suppressed or modified, while some additions have been made. The Báb was succeeded in his death by Mírzá Yahyâ of Nīrîz (at that time only about twenty years of age), who escaped to Bagdad, and, under the title of Subh-i-Esâl ("the Morning of Eternity"), became the pontiff of the sect. He lived, however, in great seclusion, leaving the direction of affairs almost entirely in the hands of his elder half-brother (born 12th November 1817), Mîrzá Husayn 'Ali, entitled Bahá'u'lláh ("the Splendour of God"), who thus gradually became the most conspicuous and most influential member of the sect, though in the Iqân, one of the most important polemical works of the Bábís, composed in 1838—1839, he still implicitly recognized the supremacy of Subh-i-Esâl. In 1863, however, Bahá declared himself to be "He whom God shall manifest" (Mun 'l-hádthu'lláh, with prophecies of whose advent the works of the Báb are filled), and called on all the Bábís to recognize his claim. The majority responded, but Subh-i-Esâl and some of his faithful adherents refused. After that date the Bábís divided into two sects, Ezélís and Baháís, of which the former steadily lost the latter gained ground, so that in 1908 they were probably from half a million to a million of the latter, and at most only a hundred or two of the former. In 1863 the Bábís were, at the instance of the Persian government, removed from Bagdad to Constantinople, whence they were shortly afterwards transferred to Adrianople. In 1868 Bahá and his followers were exiled to Acre in Syria, and Subh-i-Esâl with his few adherents to Famiagusta in Cyprus, where he was still living in 1908. Bahá'u'lláh died at Acre on the 16th of May 1892. His son 'Abdás Efendî (also called 'Abdu'll-Bahá, "the servant of Bahá") was generally recognized as his successor, but another of his four sons, Muhammad 'Ali, put forward a rival claim. This caused a fresh and bitter schism, but 'Abdás Efendî steadily gained ground, and there could be little doubt as to his eventual
The controversy literature connected with this latest schism is abundant, not only in Persian, but in English, for since 1890 many Westerners have adopted the religion of Bahá'. The original apostle of America was 'Abdu'l-Bahá Khayru'lláh, who began his propaganda as the Chicago exhibition and later supported the claims of Muhammad 'Ali. Several missionaries, including the aged and learned Mirzâ Abú'l-Fazl of Gulpáyagán, were thereupon despatched to America by 'Abbas Efendi, who was generally accepted by the American Bahá'ís as the "Master." The American press contained many notices of the propaganda and its success. An interesting article on the subject, by Stoyan Krstof Vratsalys of Boston, Mass., entitled "Mohammedan Gnosticism in America," appeared in the American Journal of Theology for January 1902, pp. 57-58.

A correct understanding of the doctrines of the early Bahá'ís (now represented by the Eezlí) is hardly possible save to one who is conversant with the theology of Islam and its developments, and especially the tenets of the Shí'a. The Bahá'ís are Mohammedans only in the sense that the Mohammedans are Christians or the Christians Jews; that is to say, they recognize Muhammad (Mahomet) as a true prophet and the Qur'an (Koran) as a revelation, but deny their finality. Revelation, according to their view, is progressive, and no revelation is final, for, as the human race grows in knowledge, the revelations become more and more suitable to the age, and are vouchsafed. The Divine Unity is incomprehensible, and can be known only through its Manifestations; to recognize the Manifestation of the cycle in which he lives is the supreme duty of man. Owing to the enormous volume and unsystematic character of the Bahá'í scriptures, and the absence of anything resembling church councils, the doctrine on many important points (such as the future life) is undetermined and vague. The resurrection of the body is denied, but some form of personal immortality is generally, though not universally, accepted. Great importance was attached to the mystical values of letters and numbers, especially the numbers 18 and 19 ("the number of the unity") and 19 = 361 ("the number of all things"). In general, the Bahá'í doctrines most closely resembled those of the Ismá'íllis and Hurufis. In the hands of Bahá'ís the aims of the sect became much more practical and ethical, and the wilder pantheistic tendencies and metaphysical hair-splittings of the early Bahá'ís almost disappeared. The intelligence, integrity and morality of the Bahá'ís are high, but their efforts to improve the present world have become much exaggerated. They were in no way concerned (as was the time false) in the assassination of Náṣiru'd-Dín Sháh in May 1896. Of recent persecutions of the sect the two most notable took place at Yazd, one in May 1891, and another of greater ferocity in June 1903. Some account of the latter is given by Napier Malcolm in his book Five Years in a Persian Town (London, 1903), pp. 87-89 and 86. In the constitutional movement in Persia (1907) the Bahá'ís, though their sympathies are undoubtedly with the reformers, wisely refrained from outwardly identifying themselves with that party, to whom their open support, by alienating the orthodox mujtahids and mullâs, would have proved fatal. Here, as in all their actions, they clearly obeyed orders issued from headquarters.

LITERATURE.—The literature of the sect is very voluminous, but mostly in manuscript. The most valuable public collections in Europe are at St Petersburg, London (British Museum) and Bibliothèque Nationale), where two or three very rare MSS. collected by Bobineau, including the precious history of the Bahá'í's contemporary, Hájí Mirzá Jalál of Kâshán, are preserved. For the bibliog-raphy up to 1889, see vol. ii. pp. 231-232 of the Traveller's Narrative. A complete, but not yet published, work composed by Bahá's son, 'Abbas Efendi, edited, translated and annotated by E. G. Browne (Cambridge, 1891). More recent works are:—Browne, The New History of the Bahá'í (Cambridge, 1893); and A Catalogue and Description of the Bahá'í Manuscripts in the Robert de Vismaux Collection, Journal of R. Asiatic Soc. July and October 1892; Andreas, Die Bahá'ís in Persien (1896); Baron Victor Rosen, Collections scientifiques de l'Institut des Langues orientales, vol. i. (1877), pp. 179-212; vol. ii (1886), pp. 1-51; vol. vi. (1891), pp. 141-255; "Manuscrits Bahá'ís"; and other important articles in Russian by the same scholar; and by Captain A. G. Tounamsky in the Zapiski vostochna- partyokh Imperatoravskaya Russkav Archeologicheskaya Obshchestva (vols. iv-xii., St Petersburg, 1890-1900); also an excellent edition by Tounamsky, with Russian translation, notes and introduction, of the Kitáb-i-Ádqas (the most important of Bahá's works), 2 vols. (St Petersburg, 1895). Mention should also be made of an Arabic translation and commentary on the Kitáb-i-Ádqas, written by a Persian, Mirzá Muhammad Mahdi Khan, Zámita, published in Cairo in A.H. 1321 (= A.D. 1903-1904). Of the works composed in English for the American converts the most important are:—The Bahá'í Breviary (The Glory of God, by 'Abdu'l-Bahá, assisted by Howard MacNutt (Chicago, 1910); The Three Questions (n.d.); and Facts for Bahá'ís (1901), by the same; Life and Teachings of 'Abbas Efendi, by Myron H. Phelps, with preface by E. G. Browne (New York, 1900); Isabella Brittingham, The Revelations of God (Boston, 1901); Laura Clifford-Burney, Some Answered Questions Collected [in Acre, 1904-1906] and Translated from the Persian of 'Abdu'l-Bahá [i.e. 'Abbas Efendi] (London, 1908). In French, A. L. M. Nicolas (first dragnan at the French legation at Teheran) has published several important translations, via: Le Livre des sept preuves de la mission du Báb (Paris, 1902); Le Livre de la certitude (1904); and Le Beydán aroar (1905); and there are other notable works by H. Dreyfus, an adherent of the B&WingTom. Lastly, mention should be made of a remarkable but scarce little tract by Gabriel Suy, printed at Cairo in June 1902, and entitled Du rige de Dieu et de l'Aneau, connu sous le nom de Babyme. (E. G. B.)

BABINGTON, ANTHONY (1561-1586), English conspirator, son of Henry Babington of Dethick in Derbyshire, and of Mary, daughter of George, Lord Darcy, was born in October 1561, and was brought up secretly a Roman Catholic. As a youth he served at Sheffield as page to Mary queen of Scots, for whom he early felt an ardent devotion. In 1580 he came to London, attended the court of Elizabeth, and joined the secret society formed that year supporting the Jesuit missionaries. In 1582 after the execution of Father Campion he withdrew to Dethick, and attaining his majority occupied himself for a short time with the management of his estates. Later he went abroad and became associated at Paris with Mary's supporters who were planning his escape with that of Spain, and on his return he was entrusted with letters for her. In April 1584, he accompanied, with the priest John Ballard, leader of a plot to murder Elizabeth and her ministers, and organized a general Roman Catholic rising in England and liberate Mary. The conspiracy was regarded by Mendoza, the Spanish ambassador, one of its chief instigators, and also by Walsingham, as the most dangerous of recent years; it included, in its general purpose of destroying the government, a large number of Roman Catholics, and had ramifications all over the country. Philip II. of Spain, who ardently desired the success of an enterprise "so Christian, just and advantageous to the holy Catholic faith," promised to assist with an expedition directly the assassination of the queen was effected. Babington's conduct was marked by open folly and vanity. Desirous of some token of appreciation from Mary for his services, he entered into a long correspondence with her, which was intercepted by the spies of Walsingham. On the 4th of August Ballard was seized and betrayed his comrades, probably under torture. Babington then applied for a passport abroad, for the ostensible purpose of going upon his refuge, but in reality to organize the foreign expedition and secure his own safety. The passport being delayed, he offered to reveal to Walsingham a dangerous conspiracy, but the latter sent no reply, and meanwhile the ports were closed and none allowed to leave the kingdom for some days. He was still allowed his liberty, but one night while supper with Walsingham's servant he observed a memorandum of the minister's concerning himself, fled to St John's Wood, where he was joined by some of his companions, and after disguising himself succeeded in reaching Harrow, where he was sheltered by a recent convert to Romanism. Towards the end of August he was discovered and imprisoned in the Tower. On the 13th and 14th of September he was tried with Ballard and five others by a special commission, and when he confessed his guilt, but strove to place all the blame upon Ballard. All were condemned to death for high treason. On the 19th he wrote to Elizabeth praying for mercy, and the same day offered £1000 for procuring his pardon; and on the 26th, having disclosed the cipher used in the correspondence between himself and Mary, he was executed

1 Cala, of State Papers Simancas, iii. 606, Mendoza to Philip.
BABINGTON—BABRIUS

with the usual barbarities in Lincoln's Inn Fields. The detection of the plot led to Mary's own destruction. There is no positive documentary proof in Mary's own hand that she had knowledge of the intended assassination of Elizabeth, but her circumstances, together with the tenor of her correspondence with Babington, place her complicity beyond all reasonable doubt.

BABINGTON, CHURCHILL (1821-1889). English classical scholar and archaeologist, was born at Roeciffe, in Leicestershire, on the 11th of March 1821. He was educated by his father till he was seventeen, when he was placed under the tuition of Charles Wycliffe Goodwin, the orientalist and archaeologist. He entered St John's College, Cambridge, in 1839, and graduated B.A. in 1843, being seventh in the first class of the classical tripos and a senior optime. In 1845 he obtained the Hulsean Prize for his essay The Influence of Christianity in promoting the Abolition of Slavery in Europe. In 1846 he was elected to a fellowship and took orders. He proceeded to the degree of M.A. in 1846 and D.D. in 1879. From 1848 to 1851 he was vicar of Horningsea, near Cambridge, and from 1856 to his death on the 12th of January 1889, vicar of Cockfield in Suffolk. From 1863 to 1880 he held the Disney professorship of archaeology at Cambridge. In his lectures, illustrated from his own collections of coins and vases, he dealt chiefly with Greek and Roman pottery and numismatics.

Dr Babington was a many-sided man, and wrote on a variety of subjects. His early familiarity with country life gave him a taste for natural history, especially botany and ornithology. He was also an authority on entomology. He was the author of the appendices on botany (in part) and ornithology in Potter's History and Antiquities of Charnwood Forest (1842); Mr Macaulay's Character of the Clergy... considered (1849), a defence of the clergy of the 17th century, which received the approval of Mr Gladstone, against the strictures of Macaulay. He also brought out the editio princeps of the speeches of Hypereides Against Demosthenes (1850), On Behalf of Lycaophon and Euxenippus (1853), and his Funeral Oration (1858). It was by his edition of these speeches from the papyri discovered at Thbes (Egypt) in 1847 and 1856 that Babington's fame as a Greek scholar was made. In 1855 he published an edition of Beneficio della Morte di Cristo, a remarkable book of the Reformation period, attributed to Paleario, of which nearly all the copies had been destroyed by the Inquisition. Babington's edition was a facsimile of the editio princeps published at Venice in 1543, with Introduction and French and English notes. He also edited the first published work of the Claudian, Polydoros' Re oppressor of Overmuch Blaming of the Clergy (1860), undertaken at the request of the Master of the Rolls; Introductory Lecture on Archaeology (1852); Roman Antiquities found at Rougham (1872); Catalogue of Birds of Suffolk (1884-1886); Flora of Suffolk (with W. M. Hind, 1880), and (1855, 1865) some inscriptions found in Crete by T. A. B. Spratt, the explorer of the island. In addition to contributing to various classical and scientific journals, he catalogued the classical MSS. in the University Library and the Greek and English coins in the Fitzwilliam museum.

BABIRUSA ("pig-deer"), the Malay name of the wild swine of Celebes and Buru, which has been adopted in zoology as the scientific designation of this remarkable animal (the only representative of its genus), in the form of Babirusa aljurus. The skin is nearly naked, and very rough and rugged. The total number of teeth is 34, with the formula i.3, c.1, p.4, m.3. The molars, and more especially the last, are smaller and simpler than in the pigs of the genus Sus, but the peculiarities of this genus in the extraordinary development of the canines, on either side of the mouth, the ever-growing, long, slender and curved, and without enamel. Those of the upper jaw are directed upwards from their bases, so that they never enter the mouth, but pierce the skin of the face, thus resembling horns rather than teeth; they curve backwards, downwards, and finally often forwards again, almost or quite touching the forehead. Dr A. R. Wallace remarks that "it is difficult to understand what can be the use of these horn-like teeth. Some of the old writers supposed that they served as hooks by which the creature could rest its head on a branch. But the way in which they usually diverge just over and in front of the eye has suggested the more probable idea, that they serve to guard these organs from thorns and spines while hunting for fallen fruits among the tangled thickets of rattans and other spiny plants. Even this, however, is not satisfactory, for the female, who must seek her food in the same way, does not possess them. I should be inclined to believe rather that these tusks were once useful, and were then worn down as fast as they grew, but that changed conditions of life have rendered them unnecessary, and they now develop into a monstrous form, just as the incisors of the beaver and rabbit will go on growing if the opposite teeth do not wear them away. In old animals they reach an enormous size, and are generally broken off as if by fighting." On this latter view we may regard the tusks of the male babirusa as examples of redundant development, analogous to that of the single pair of lower teeth in some of the beaked whales. Unlike ordinary wild pigs, the babirusa produces uniformly coloured young. (See SWINE. (R. L.)*

BABOON (from the Fr. babuin, which is itself derived from Babon, the Egyptian deity to whom it was sacred), properly the designation of the long-muzzled, medium-tailed Egyptian monkey, scientifically known as Papio anubis; in a wider sense applied to all the members of the genus Papio (formerly known as Cynocephalus) now confined to Africa and Arabia, although in past times extending into India. Baboons are for the most part large terrestrial monkeys with short or medium-sized tails, and long naked dog-like muzzles, in the truncated extremity of which are pierced the nostrils. As a rule, they frequent barren rocky districts in large droves, and are exceedingly fierce and dangerous to approach. They have large cheek-pouches, large naked callousities, often brightly coloured, on the buttocks, and short thick limbs, adapted rather to walking than to climbing. Their diet includes practically everything eatable they can capture or kill. The typical representative of the genus is the yellow baboon (P. cynocephalus, or babuin), distinguished by its small size and grooved muzzle, and ranging from Abyssinia to the Zambezi. The above-mentioned anubis baboon, P. anubis (with the subspecies neumanni, pruinosa, heuglini and doguera), ranging from Egypt all through tropical Africa, together with P. sphinx, P. olivaceus, the Abyssinian P. leucopeuros, and the chacma, P. porcarious of the Cape, represent the subgenus Cheirogaleus. The named Arabian baboon, P. hamadryas of North Africa and Arabia, dedicated by the ancient Egyptians to the god Thoth, and the South Arabian P. arabicus, typify Hamadryas; while the drill and mandrill of the west coast, P. leucophaeus and P. maimon, constitute the subgenus Maimon. The anubis baboons, as shown by the frescoes, were tamed by the ancient Egyptians and trained to pluck sycamore-figs from the trees. (See PRIMATES; CHACMA; DRILL; GELADA and MANDRILL. (R. L.)*

BABRIUS, author of a collection of fables written in Greek. Practically nothing is known of him. He is supposed to have been a Roman, whose gentile name was possibly Valerius, living in the East, probably in Syria, where the fables seem first
to have gained popularity. The address to "a son of King Alexander" has caused much speculation, with the result that dates varying between the 3rd century B.C. and the 3rd century A.D. have been assigned to Babrius. The Alexander referred to may have been Alexander Severus (A.D. 222-235), who was fond of having literary men of all kinds about his court. "The son of Alexander" has further been identified with a certain Branchus mentioned in the fables, and it is suggested that Babrius may have been his tutor; probably, however, Branchus is a purely fictitious name. There is no mention of Babrius in ancient writers before the beginning of the 3rd century A.D., and his language and style seem to show that he belonged to that period. The first critic who made Babrius more than a mere name was Richard Bentley, in his Dissertation on the Fables of Aesop. In a careful examination of these prose Aesopian fables, which had been handed down in various collections from the time of Maximus Planudes, Bentley discovered traces of versification, and was able to extract a number of verses which he assigned to Babrius. Tyrwhitt (De Babrio, 1776) followed up the researches of Bentley, and for some time the efforts of scholars were directed towards reconstructing the metrical original of the prose fables. In 1842 M. Minas, a Greek, the discoverer of the Philosophoimenos of Hippolytus, came upon a MS. of Babrius in the convent of St. Laura on Mount Athos, now in the British Museum. This MS. contained 123 fables out of the supposed original number, 160. They are arranged alphabetically, but break off at the letter O. The fables are written in choliambic, i.e. limping or imperfect iambic verse, having a spondee as the last foot, a metre originally appropriated to satire. The style is extremely good, the expression being terse and pointed, the versification correct and elegant, and the construction of the stories is fully equal to that in the prose versions. The genuineness of this collection of the fables was generally admitted by scholars. In 1857 Minas professed to have discovered at Mount Athos another MS. containing 94 fables and a preface. As the MS. had in the MS. he made a copy of it, which was sold to the British Museum, and was published in 1859 by Sir G. Cornewall Lewis. This, however, was soon proved to be a forgery. Six more fables were brought to light by P. Knöll from a Vatican MS. (edited by A. Eberhard, Analecta Babriana, 1879).

See also Mantels, Über die Fabeln des B. (1840); Cruisius, De Babrii Aetate (1879); Ficus, De Babrii Vita (1886); J. Wiener, Quaestiones Babrianeae (1891); Comington, Medulla Babrianae (1894-95); Marchalino, Babro (1897); Fortunatus, Babro (1901); Christofferson, Studia de Fabulis Babrianeis (1901). There are translations in English by Davies (1860) and in French by Levêque (1896), and in many other languages.

BABU, a native Indian clerk. The word is really a term of respect attached to a proper name, like "master" or "Mr.," and Babu-ji is still used in many parts of India, meaning "sir," but without the suffix the word itself is now generally used contemptuously as signifying a semi-literate native, with a marked faculty of mendicant calculation.

BABY-FARMING, a term meaning generally the taking in of infants to nurse for payment, but usually with an implication of improper treatment. Previous to the year 1871 the abuse of the practice of baby-farming in England had grown to an alarming extent, while the trials of Margaret Waters and Mary Hall called attention to the infamous relations between the lying-in houses and the baby-farming houses of London. The evil was, no doubt, largely connected with the question of illegitimacy, for there was a wide-spread existence of baby-farms where children were received without question on payment of a lump sum. Such children were nearly all illegitimate, and in these cases it was to the pecuniary advantage of the baby-farmer to hasten the death of the child. It had become also the practice for factory operatives and mill-hands to place out their children by the day, and since in many cases the children were looked upon as a burden and a drain on their parents' resources, too particular inquiry was not always made as to the mode in which the children were cared for. The form was gone through too of paying a ridiculously insufficient sum for the maintenance of the child. In 1871 the House of Commons found it necessary to appoint a select committee to inquire as to the best means of preventing the destruction of the lives of infants put out to nurse for hire by their parents. "Improper and insufficient food," said the committee, "opiates, drugs, crowded rooms, bad air, want of cleanliness, and wilful neglect are sure to be followed in a few months by diarrhoea, convulsions and wasting away." These unfortunate children were nearly all illegitimate, and the mere fact of their being hand-nursed, and not breast-nursed, goes some way (according to the experience of the Foundling hospital and the Magdalene home) to explain the great mortality among them. Such children, when nursed by their mothers in the workhouse, generally live. The practical result of the committee of 1871 was the act of 1875, which provided for the compulsory registration of all houses in which more than one child under the age of one year were received for a longer period than twenty-four hours. No licence was granted by the justices of the peace, unless the house was suitable for the purpose, and its own a person of good character and able to maintain the children. Offences against the act, including wilful neglect of the children even in a suitable house, were punishable by a fine of £5 or six months' imprisonment with or without hard labour. In 1896 a select committee of the House of Lords sat and reported on the working of this act. In consequence of this report the act of 1875 was repealed and superseded by the Infant Life Protection Act 1897, which did away with the system of registration and substituted for it one of notice to a supervening authority. By the act all persons retaining or receiving for hire more than one infant under the age of one year to give written notice of the fact to the local authority. The local authorities were empowered to appoint inspectors, and required to arrange for the periodical inspection of infants so taken in, while they could also fix the number of infants which might be retained. By a special clause any person receiving an infant under the age of two years for a sum of money not exceeding twenty pounds had to give notice of the fact to the local authority. If any infants were improperly kept, the inspector might obtain an order for their removal to a workhouse or place of safety until restored to their parents or guardians, or otherwise legally disposed of. The act of 1897 was repealed and amended by the Children Act 1908, which codified the law relating to children, and added many new provisions. This act is dealt with in the article CHILDREN, LAW RELATING TO.

In the United States the law is noticeably strict in most states. In Massachusetts, a law of 1891 directs that "every person who receives for board, or for the purpose of procuring adoption, an infant under the age of three years shall use diligence to ascertain whether or not such infant is illegitimate, and if he knows or has reason to believe it to be illegitimate shall forthwith notify the State Board of Charity of the fact of such reception; and said board and its officers or agents may enter and inspect any building where they may have reason to believe that any such illegitimate infant is boarded, and remove such infant when, in their judgment, such removal is necessary by reason of neglect, abuse or other causes, in order to preserve the infant's life, and such infant so removed shall be in the custody of said Board of Charity, which shall make provision therefor according to law." The penal code of the state of New York requires a licence for baby-farming to be issued by the board of health of the city or town where such children are boarded or kept, and every person so licensed must keep a register wherein he shall enter the names and ages of all such children, and of all children born on such premises, and the names and residences of their parents, as far as known, the time of reception and the discharge of such children, and the reasons therefor, and also a correct register of every child under five years of age who is given out, adopted, taken away, or indentured from such place...
to or by any one, together with the name and residence of the person so adopting" (Pen. Code, § 288, subsec. 4). Persons neglecting children may be prosecuted under § 289 of the N.Y. penal code, which provides that any person who "wilfully causes or permits the life or limb of any child, actually or apparently under the age of sixteen years, to be endangered, or its health to be injured, or its morals to become depraved... is guilty of a misdemeanor."

In Australia particular care has been taken by most of the states to prevent the evils of baby-farming. In South Australia there is a State Children's Council, which, under the State Children Act of 1893, has large powers with respect to the oversight of infants under two years boarded out by their mother. "Foster-mothers," as the women who take in infants as boarders are called, must be licensed, while the number of children authorized to be kept by the foster-mother is fixed by licence; every licensed foster-mother must keep a register containing the name, age and place of birth of every child received by her, the names, addresses and description of the parents, or of any person other than the parents from or to whom the child was received or delivered over, the date of receipt or delivery over, particulars of any accident to or illness of the child, and the name of the medical practitioner (if any) by whom attended. In New South Wales the Children's Protection Act of 1892, with the amendments of 1902, requires the same state supervision over the homes in which children are boarded out, with licensing of foster-mothers. In Victoria an act was passed in 1890 for "making better provision for the protection of infant life." In New Zealand, there is legislation to the same effect by the "Adoption of Children Act 1895" and the "Infant Life Protection Act 1896."

**BABYLON** (mod. **Hilla**), an ancient city on the left bank of the Euphrates, about 70 m. S. of Bagdad. "Babylon" is the Greek form of Babel or Bah-ili, "the gate of the god" (sometimes incorrectly written "of the gods"), which again is the Semitic translation of the original Sumerian name Ka-dimma. The god was probably Merodach or Marduk (q.v.), the divine patron of the city. In an inscription of the Kassite conqueror Gaddas the name appears as Ba-ba-lam, as if from the Assyrian bahilu, "to bring"; another foreign Volksytymologie is found in Gen. xxv. 9, from bahal, "to confound." A second name of the city, which perhaps originally denoted a separate village or quarter, was Su-anma, and in later inscriptions it is often represented ideographically by E-ki, the pronunciation and meaning of which are uncertain. One of its oldest names, however, was Din-tir, of which the poets were especially fond; Din-tir signifies in Sumerian "the life of the forest," though a native lexicon translates it "seat of life." Uru-azaggga, "the holy city," was also a title sometimes applied to Babylon as to other cities in Babylonia. Ka-dimma, the Semitic Bah-ili, probably denoted at first E-Saggila, "the house of the holy head," the temple dedicated to Bel-Merodach, along with its immediate surroundings. Like the other great sanctuaries of Babylonia the temple had been founded in pre-Semitic times, and the future Babylon grew up around it. Since Merodach was the son of Ea, the culture god of Eridu near Ur on the Persian Gulf, it is possible that Babylon was a colony of Eridu. Adjoining Babylon was a town called Borsippa (q.v.).

The earliest mention of Babylon is in a dated tablet of the reign of Sargon of Akkad (3500 B.C.), who is stated to have built sanctuaries there to Anunit and Aē (or Ea), and H. Winckler may be right in restoring a mutilated passage in the annals of this king so as to make it mean that Babylon owed its name to Sargon, who made it the capital of his empire. If so, it fell back afterwards into the position of a mere provincial town and remained so for centuries, until it became the capital of "the first dynasty of Babylon" and then of Khammurabi's empire (2350 B.C.). From this time onward it continued to be the capital of Babylonia and the holy city of western Asia. The claim to supremacy in Asia, however real in fact, was not admitted de jure until the claimant had "taken the hands" of Bel-Merodach at Babylon, and thereby been accepted as his adopted son and the inheritor of the old Babylonian empire. It was this which made Tiglath-pileser III. and other Assyrian kings so anxious to possess themselves of Babylon and so to legitimize their power. Sennacherib alone seems to have failed in securing the support of the Babylonian priesthood; at all events he never underwent the ceremony, and Babylonia throughout his reign was in a constant state of revolt which was finally suppressed only by the complete destruction of the capital. In 689 B.C. its walls, temples and palaces were razed to the ground and the rubbish thrown into the Arakhtu, the canal which bordered the earlier Babylon on the south. The act shocked the religious conscience of western Asia; the subsequent murder of Sennacherib was held to be an expiation of it, and his successor Esar-haddon hastened to rebuild the old city, to receive there his crown, and make it his residence during part of the year. On his death Babylonia was left to his elder son Samas-sum-yukin, who eventually headed a revolt against his brother Assur-bani-pal of Assyria. Once more Babylon was besieged by the Assyrians and starved into surrender. Assur-bani-pal purified the city and celebrated a "service of reconciliation," but did not venture to "take the hands" of Bel. In the subsequent overthrow of the Assyrian empire the Babylonians saw another example of divine vengeance.

With the recovery of Babylonian independence under Nabopolassar a new era of architectural activity set in, and his son Nebuchadrezzar made Babylon one of the wonders of the ancient world. It surrendered without a struggle to Cyrus, but two sieges in the reign of Darius Hystaspis, and one in the reign of Xerxes, brought about the destruction of the defences, while the monotheistic rule of Persia allowed the temples to fall into decay. Indeed part of the temple of E-Saggila, which like other ancient temples served as a fortress, was intentionally pulled down by Xerxes after his capture of the city. Alexander was murdered in the palace of Nebuchadrezzar, which must therefore have been still standing, and cuneiform texts show that, even under the Seleucids, E-Saggila was not wholly a ruin. The elevation of Seleucia in its neighbourhood, however, drew away the population of the old city and hastened its material decay. A tablet dated 275 B.C. states that on the 12th of Nisan the inhabitants of Babylon were transported to the new town, where a palace was built as well as a temple to which the ancient name of E-Saggila was given. With this event the history of Babylon comes practically to an end, though more than a century later we find sacrifices being still performed in its old sanctuary.

Our knowledge of its topography is derived from the classical writers, the inscriptions of Nebuchadrezzar, and the excavations of the Deutsche Orientgesellschaft, which were begun in 1899. The topography is necessarily that of the Babylon of Nebuchadrezzar; the older Babylon which was destroyed by Sennacherib having left few, if any, traces behind. Most of the existing remains lie on the E. bank of the Euphrates, the principal being three vast mounds, the Babīl to the north, the Qasr or "Palace" (also known as the Majidība) in the centre, and the Ishān 'Amrān ibn 'Ali, with the outlying spur of the Junjuma, to the south. Eastward of these come the Ishān el-Aswad or "Black Mound" and three lines of rampart, one of which encloses the Babīl mound on the N. and E. sides, while a third forms a triangle with the S.E. angle of the other two. W. of the Euphrates are other ramparts and the remains of the ancient Borsippa.

We learn from Herodotus and Ctesias that the city was built on both sides of the river in the form of a square, and enclosed within a double row of lofty walls to which Ctesias adds a third. Ctesias makes the outermost wall 360 stades (42 m.) in circumference, while according to Herodotus it measured 480 stades (56 m.), which would include an area of about 200 sq. m. The estimate of Ctesias is essentially the same as that of Q. Curtius (v. i. 26). 368 stades, and Clitarchus (ap. Diod. Sic. ii. 7), 365 stades; Strabo (xvi. i. 5) makes it 385 stades. But even the estimate of Ctesias, assuming the stade to be its usual length, would imply an area of about 100 sq. m. According to Herodotus the height of the walls was about 335 ft. and their width 85 ft;
BABYLONIA AND ASSYRIA

99

according to Ctesias the height was about 300 ft. The measurements seem exaggerated, but we must remember that even in Xenophon’s time (Anab. iii. 4. 10) the ruined wall of Nineveh was still 150 ft. high, and that the space between the towers of the wall was 20 cubits (Ctes. 471, Diod. ii. 7) were broad enough to let a four-horse chariot turn (Herod. i. 179). The clay dug from the moat served to make the bricks of the wall, which had 100 gates, all of bronze, with bronze lintels and posts. The two inner enclosures were faced with enameled tiles and represented hunting-scenes. Two other walls ran along the banks of the Euphrates and the quays with which it was lined, each containing 25 gates which answered to the number of streets they led into. Ferry-boats plied between the landing-places of the gates, and a movable drawbridge (30 ft. broad), supported on stone piers, joined the two parts of the city together.

The account thus given of the walls must be grossly exaggerated and cannot have been that of an eye-witness. Moreover, the two-walls—Imkur-Bel, the inner wall, and Nimittiti-Bel, the outer—which enclosed the city proper on the site of the older Babylon have been confused with the outer ramparts (enclosing the whole of Nebuchadrezzar’s city), the remains of which can still be traced to the east. According to Nebuchadrezzar, Imkur-Bel was built in the form of a square, each side of which measured “30 asu by the great cubit”; this would be equivalent, if Professor F. Hommel is right, to 2400 metres. Four thousand cubits to the east the great rampart was built of mounds, which surrounded both old and new town; it was 25 metres high, and a reservoir was excavated in the triangle on the inner side of its south-east corner, the western wall of which is still visible. The Imkur-Bel of Sargon’s time has been discovered by the German excavators running south of the Qasr from the Euphrates to the Gate of Ishtar.

The German excavations have shown that the Qasr mound represents both the old palace of Nabopolassar, and the new palace adjoining it built by Nebuchadrezzar, the wall of which he boasts of having completed in 15 days. They have also laid bare the site of the “Gate of Ishtar” on the east side of the mound and the little temple of Nin-Makh (Beltis) beyond it, as well as the raised road for solemn processions (A-bur-sabu) which led from the Gate of Ishtar to E-Saggila and skirted the east side of the palace. The road was paved with stone and its walls on either side lined with enameled tiles, on which a procession of lions is represented. North of the mound was a canal, which seems to have been the Libbikhegal of the inscriptions, while on the south side was the Arakhtu, “the river of Babylon,” the brick quays of which were built by Nabopolassar.

The site of E-Saggila is still undetermined; the German excavators assign it to the ‘Amran mound, its tower having stood in a depression immediately to the north of this, and so place it south of the Qasr; but E. Lindl and F. Hommel have put forward strong reasons for considering it to have been north of the latter, on a part of the site which has not yet been explored. A tablet copied by George Smith gives us interesting details as to the plan and dimensions of this famous temple of Bel; a plan based on these will be found in Hommel’s Grundris der Geographie und Geschichte des alten Orient, p. 321. There were three courts, the outer or great court, the middle court of Ishtar and Zamama, and the inner court on the east side of which was the tower of seven stages (known as the House of the Foundation of Heaven and Earth), 90 metres high according to Hommel’s calculation of the measurements in the tablet; while on the west side was the temple proper of Merodach and his wife Sarpanit or Zarpanit, as well as chapels of Anu, Ea and Bel on either side of it. A winding ascent led to the summit of the tower, where there was a chapel, containing, according to Herodotus, a couch and golden table (for the showbread) but no image. The golden image of Merodach 40 ft. high, stood in the temple below, in the sanctuary called E-Ku or “House of the Oracle,” together with a table, a mercy-seat and an altar—all of gold. The deities whose chapels were erected in the precincts of the temple enclosure were regarded as forming his court. Fifty-five of these chapels existed altogether in Babylon, but some of them stood independently in other parts of the city.

There are numerous cuneiform tablets on the walls both of E-Saggila and of the city, the names of many of which are now known. Nebuchadrezzar says that he covered the walls of some of them with blue enameled tiles “on which bulls and dragons were poured,” and that he set up large bulls and serpents of bronze on their thresholds.

The Babîl mound probably represents the site of a palace built by Nebuchadrezzar at the northern extremity of the city walls and attached to a defensive outwork 60 cubits in length. Since H. Rassam found remains of irrigation works here it might well be the site of the Hanging Gardens. These consisted, we are told, of a garden of trees and flowers, built on the topmost of a series of arches some 75 ft. high, and in the form of a square, each side of which measured 400 Greek ft. Water was raised from the Euphrates by means of a screw (Strabo xvi. r. 5; Diod. ii. 10. 6). In the Junjum a mound at the southern extremity of the old city the contract and other business tablets of the Egibi firm were found.

BABYLONIA AND ASSYRIA. I. Geography.—Geographically as well as ethnologically and historically, the whole district enclosed between the two great rivers of western Asia, the Tigris and Euphrates, forms but one country. The writers of antiquity clearly recognized this fact, speaking of the whole under the general name of Assyria, though Babylonia, as will be seen, would have been a more accurate designation. It naturally falls into two divisions, the northern being more or less mountainous, while the southern is flat and marshy; the near approach of the two rivers to one another, at a spot where the undulating plateau of the north sinks suddenly into the Babylonian alluvium, tends to separate them still more completely. In the earliest times of which we have any record, the northern portion was included in Mesopotamia; it was definitely marked off as Assyria only after the rise of the Assyrian monarchy. With the exception of Assur, the original capital, the chief cities of the country, Nineveh, Calah and Arbela, were all on the left bank of the Tigris. The reason of this preference for the eastern bank of the Tigris was due to its abundant supply of water, whereas the great Mesopotamian plain on the western side had to depend upon the streams which flowed into the Euphrates. This vast flat, the modern El-Truzirch, is about 250 miles in length, interrupted only by a single limestone range, rising abruptly out of the plain, and branching off from the Zagros mountains under the names of Sarâsîr, Hamrîn and Sinjar. The numerous remains of old habitations show how thickly this level tract must once have been peopled, though now for the most part a wilderness. North of the plateau rises a well-watered and undulating belt of country, into which run low ranges of limestone hills, sometimes arid, sometimes covered with dwarf-oak, and often stunted in, between their northern and north-eastern flank and the main mountain-line from which they detach themselves, rich plains and fertile valleys. Behind them tower the massive ridges of the Niphates and Zagros ranges, where the Tigris and Euphrates take their rise, and which cut off Assyria from Armenia and Kurdistan.

The name Assyria itself was derived from that of the city of Assur (p.v.) or Asur, now Qal‘at Sherqat (Kaleh Sherqat), which stood on the right bank of the Tigris, midway between the Greater and the Lesser Zab. It remained the capital long after the Assyrians had become the dominant power in western Asia, but was finally supplanted by Calah (Ninmird), Nineveh (Nebî Yunus and Kusîynî), and Dur-Sargina (Khorsabad), some 60 m. farther north (see Nineveh).

In contrast with the arid plateau of Mesopotamia, stretched the
rich alluvial plain of Chaldaea, formed by the deposits of the two great rivers by which it was enclosed. The soil was extremely fertile, and teemed with an industrious population. Eastward rose the mountains of Elam, southward were the sea-marshes and the Kaldâ or Chaldæans and other Aramaic tribes, while on the west the civilization of Babylonia encroached beyond the banks of the Euphrates, upon the territory of the Semitic nomads (or Suti). Here stood Ur (Mushkir, more correctly Mucayyar) the earliest capital of the country; and Babylon, with its suburb, Borsippa (Birs Nimrud), as well as the two Sipparas (the Sepharvaim of Scripture, now Abū Habbā), occupied both the Arabian and Chaldæan sides of the river (see Babylon). The Arakhtu, or “river of Babylon,” flowed past the southern side of the city, and to the south-west of it on the Arabian bank lay the great inland freshwater sea of Nejrī, surrounded by red sandstone cliffs of considerable height, 40 m. in length and 35 in breadth in the widest part. Above and below this sea, from Borsippa to Kufa, extend the famous Chaldæan marshes, where Alexander was nearly lost (Arrian, Exp. Al. vii. 22; Strab. xvi. 1, § 12); but these depend upon the state of the Hindyia canal, disappearing altogether when it is closed. Mentioned also in the records northward of Sippara, Kutha and Babylon were Kis (Uahrain, 9 m. E. of Hillah), Nippur (Niffer)—where stood the great sanctuary of El-il, the older Bel—Urur or Erech (Warka) and Larsa (Senkera) with its temple of the sun-god, while eastward of the Shatt el-Hai, probably the ancient channel of the Tigris, was Lagash (Tello), which played an important part in early Babylonian history. The primitive seaport of the country, Eridu, the seat of the worship of Ea the culture-god, was a little south of Ur (at Abū Shahrain or Amoiwa) on the west side of the Euphrates. It is now about 130 m. distant from the sea; as about 46 m. of land have been formed by the silting up of the shore since the foundation of Spasinus Charax (Muhammad) in the time of Alexander the Great, or some 115 ft. a. y., the city would have been in existence at least 6000 years ago. The marshes in the south like the adjoining desert were frequented by Aramaic tribes; of these the most famous were the Kaldâ or Chaldæans who under Merodach-baladan made themselves masters of Babylon and gave their name in later days to the whole population of the country. The combined stream of the Euphrates and Tigris as it flowed through the marshes was known to the Babylonians as the när marrači, “the salt river” (cp. Jer. i. 21), a name originally applied to the Persian Gulf.

The alluvial plain of Babylonia was called Edin, the Eden of Gen. ii., though the name was properly restricted to “the plain” on the western bank of the river where the Bedouins pastured the flocks of their Babylonian masters. This “bank or kisad, together with the corresponding western bank of the Tigris (according to Hommel the modern Shatt el-Hai), gave its name to the land of Cheshed, whence the Kasdim of the Old Testament. In the early inscriptions of Lagash the whole district is known as Gu-Edinna, the Semitic equivalent of the Semitic Kisad Edini. The land was similarly known as Gu-ābbá (Semitic Kisad tambim), the “bank of the sea.”

A more comprehensive name of southern Babylonia was Kengi, “the land,” or Kengi Sumer, “the land of Sumer,” from which Sumer alone came afterwards to be used. Sumer has been supposed to be the original of the Biblical Shinar; but Shinar represented northern rather than southern Babylonia, and was probably the Sankhar of the Tell el-Amarna tablets (but see Sumer). Opposed to Kengi and Sumer were Urra (Uri) and Akkad or northern Babylonia. The original meaning of Urra was perhaps “clayey soil,” but it came to signify “the upper country” or “highlands,” kengi being “the lowlands.” In Semitic times Urra was pronounced Uri and confounded with ura, “city”; as a geographical term, however, it was replaced by Akkadu (Akkad), the Semitic form of Agadé—written Akkattim in the Elamite inscriptions—the name of the elder Sargon’s capital, which must have stood close to Sippara, if indeed it was not a quarter of Sippara itself. The rise of Sargon’s empire was doubtless the cause of this extension of the name of Akkad; henceforward, in the imperial title, “Sumer and Akkad” denoted the whole of Babylonia. After the Kassite conquest of the country, northern Babylonia came to be known as Kar-Duniyas, “the wall of the god Duniyas,” from a line of fortification similar to that built by Nebuchadrezzar between Sippara and Opis, so as to defend his kingdom from attacks from the north. As this last was “the Wall of Semiramis” mentioned by Strabo (xii. 14, 8). Kar-Duniyas may have represented the Median Wall of Xenophon (Anab. ii. 4, 12), traces of which were found by F. R. Chesney extending from Faluja to Jibbar.

The country was thickly studded with towns, the sites of which are still represented by mounds, though the identification of most of them is still doubtful. The latest to be identified are Bismaya, between Nippur and Erech, which recent American excavations have proved to be the site of Udad (also called Adab and Usab) and the neighbouring Fara, the site of the ancient Kisuura. The dense population was due to the elaborate irrigation of the Babylonian plain which had originally reclaimed it from a pestiferous and uninhabitable swamp and had made it the most fertile country in the world. The science of irrigation and engineering seems to have been first created in Babylonia, and was conducted by a network of canals, all skilfully planned and regulated. The three chief of them carried off the waters of the Euphrates to the Tigris above Babylon—the Zaballat canal (or Naher Sarsar) running from Faluja to Ctesiphon, the Kutha canal from Sippara to Madain, passing Tell Ishram or Kutha on the way, and the King’s canal or Ar-Malcha between the other two. This last, which perhaps owed its name to Khamarubari, was conducted from the Euphrates towards Upi or Opis, which has been shown by H. Winckler (Altorientalische Forschungen, ii. pp. 509 seq.) to have been close to Seleucia on the western side of the Tigris. The Pallacopas, called Pallukkattu in the Neo-Babylonian texts, started from Pallukkattu or Faluja, and running parallel to the western bank of the Euphrates as far as Iddaratu or Teredon (?) watered an immense tract of land and supplied a large lake near Borsippa.

B. Meissner may be right in identifying it with “the Canal of the Sun-god” of the early texts. Thanks to this system of irrigation the cultivation of the soil was highly advanced in Babylonia. According to Herodotus (i. 115) wheat commonly returned two hundred-fold to the sower, and occasionally three hundred-fold. Pliny (H. N. xvi. 17) states that it was cut twice, and afterwards was good for sheep, and Berossus remarked that wheat, sesame, barley, oochrs, palms, apples and many kinds of shellled fruit grew wild, as wheat still does in the neighbourhood of Anah. A Persian poet celebrated the 360 uses of the palm (Strab. xvi. 1, 14), and Ammianus Marcellinus (xxiv. 3) says that from the point reached by Julian’s army to the shores of the Persian Gulf was one continuous forest of verdure.

II. Classical Authorities.—Such a country was naturally fitted to be a pioneer of civilization. Before the decipherment of the cuneiform texts our knowledge of its history, however, was scanty and questionable. Had the native history of Berossus survived, this would not have been the case; all that is known of the Chaldaean historian’s work, however, is derived from quotations in Josephus, Ptolemy, Eusebius and the Syneculus. The authenticity of his list of 10 antediluvian kings who reigned for 120 sari or 432,000 years, has been partially confirmed by the inscriptions; but his 8 postdiluvian dynasties are difficult to reconcile with the monuments, and the numbers attached to them are probably corrupt. It is different with the 7th and 8th dynasties as given by Ptolemy in the Almagest, which prove to have been faithfully recorded:—
The account of Babylon given by Herodotus is not that of an eye-witness, and his historical notices are meagre and untrustworthy. He was controverted by Ctesias, who, however, has mistaken mythology for history, and Greek romance owed to him his Nimus and Semiramis, its Ninays and Sardanapalus. The only ancient authority of value on Babylonian and Assyrian history is the Old Testament.

III. Modern Discovery. — The excavations of P. E. Botta and A. H. Layard at Nineveh opened up a new world, coinciding as they did with the successful decipherment of the cuneiform system of writing. Layard’s discovery of the library of Assur-bani-pal put the materials for reconstructing the ancient life and history of Assyria and Babylon into the hands of scholars. He also was the first to excavate in Babylon, where C. J. Rich had already done useful topographical work. Layard’s excavations in this latter country were continued by W. K. Loftus, who also is credited with having been the first to apply modern methods of excavation on behalf of the French government. But it was only in the last quarter of the 19th century that anything like systematic exploration was attempted. After the death of George Smith at Aleppo in 1876, an expedition was sent by the British Museum (1877–1879), under the conduct of Hormuzd Rassam, to continue his work at Nineveh and its neighbourhood. Excavations in the mounds of Balawat, called Imgur-El by the Assyrians, 15 m. east of Mosul, resulted in the discovery of a small temple dedicated to the god of dreams by Assur-nazir-pal III. (883 B.C.), containing a stone coffin or ark in which were two inscribed tablets of alabaster of rectangular shape, as well as of a palace which had been destroyed by the Babylonians but restored by Shalmaneser II. (858 B.C.). From the latter came the bronze gates with hammered reliefs, which are now in the British Museum. The remains of a palace of Assur-nazir-pal III. at Nimrud (Calah) were also excavated, and hundreds of enamelled tiles were disinterred. Two years later (1880–1881) Rassam was sent to Babylon, where he discovered the site of the temple of the sun-god of Sippata at Abu-Habba, and so fixed the position of the two Sipparas or Sepharvaim. Abu-Habba lies south-west of Bagdad, midway between the Euphrates and Tigris, on the south side of a canal, which may once have represented the main stream of the Euphrates, Sippata of the goddess Anunit, now Dur, being its opposite bank.

Meanwhile (1877–1881) the French consul, de Sarzec, had been excavating at Tello, the ancient Lagash, and bringing to light monuments of the pre-Semitic age, which included the diorite statues of Gudea now in the Louvre, the stone of which, according to the inscriptions upon them, had been brought from Mancun, the Sinitic peninsula. The subsequent excavations of de Sarzec in Tello and its neighbourhood carried the history of the city back to at least 4000 B.C., and a collection of more than 30,000 tablets has been found, which were arranged on shelves in the time of Gudea (c. 2700 B.C.). In 1886–1887 a German expedition under Karl Koldewey explored the temple of El Hibla (immediately to the south of Tello), and for the first time made us acquainted with the burial customs of ancient Babylon.

Another German expedition, on a large scale, was despatched by the Orientgesellschaft in 1890 with the object of exploring the ruins of Babylon; the palace of Nebuchadrezzar and the great processional road were laid bare, and Dr W. Andrae subsequently conducted excavations at Qal'at Sherqat, the site of Assur. Even the Turkish government has not held aloof from the work of exploration, and the Museum at Constantinople is filled with the tablets discovered by Dr V. Schell in 1897 on the site of Sippara. J. de Morgan’s exceptionally important work at Susa lies outside the limits of Babylon; not so, however, the American excavations (1903–1904) under E. J. Banks at Bismya (Udab), and those of the University of Pennsylvania at Niffer (see NIPPU) first begun in 1889, when Mr J.H. Haynes

has systematically and patiently uncovered the remains of the great temple of El-lil, removing layer after layer of débris and cutting sections in the ruins down to the virgin soil. Midway in the platform is a plain paved with tiles and the first walls of Sargon of Akkad and his son Naram-Sin (3800 B.C.); as the débris above them is 34 ft. thick, the topmost stratum being not later than the Parthian era (H. V. Hilprecht, The Babylonian Expedition, 1, p. 23), it is calculated that the débris underneath the pavement, 30 ft. thick, must represent a period of about 3000 years, more especially as older constructions had to be levelled before the pavement was laid. In the deepest part of the excavations, however, inscribed clay tablets and fragments of stone vases are still found, though the cuneiform characters upon them are of a very archaic type, and sometimes even retain their primitive pictorial forms.

IV. Chronology.—The later chronology of Assyria has long been fixed, thanks to the lists of limmi, or archons, who gave their names in succession to their years of office. Several copies of some of these lists from the library of Nineveh are in existence, the earliest of which goes back to 911 B.C., while the latest comes down to the middle of the reign of Assur-bani-pal. The beginning of a list of regents and in some of them the chief events of the year are added to the name of its archon. Assyrian chronology is, therefore, certain from 911 B.C. to 666, and an eclipse of the sun which is stated to have been visible in the month Sivan, 763 B.C., is one that has been calculated to have taken place on the 13th of June of that year. The system of reckoning time by limmi was of Assyrian origin, and recent discoveries have made it clear that it went back to the first days of the monarchy. Even in the distant colony at Kara Euyuk near Kaisariyeh (Caesarea) in Cappadocia cuneiform tablets show that the Assyrian settlers used it in the 15th century B.C. In Babylonia a different system was adopted. Here the years were dated by the chief events that distinguished them, as was also the case in Egypt in the epoch of the Old Empire. What the event should be was determined by the government and notified to all its officials; one of these notices, sent to the Babylonian officials in Canaan in the reign of Samsuiliana, the son of Khammurabi, has been found in the Lebanon. A careful register of the dates was kept, divided into reigns, from which dynastic lists were afterwards compiled, giving the duration of each king’s reign as well as that of the several dynasties. Two of these dynastic compilations have been discovered, unfortunately in an imperfect state. In addition to the chronological tables, works of a more ambitious and literary character were also attempted of the nature of chronicles. One of these is the so-called “Synchronic History of Assyria and Babylonia,” consisting of brief notices, written by an Assyrian, of the occasions on which the kings of the two countries had entered into relation, hostile or otherwise, with one another; a second is the Babylonian Chronicle discovered by Dr Th. G. Pinches, which gave a synopsis of Babylonian history from a Babylonian point of view, and was compiled in the reign of Darius. It is interesting to note that its author says of the battle of Khalitū, which we know from the Assyrian inscriptions to have taken place in 691 or 690 B.C., that he does “not know the year” when it was fought; the records of Assyria had been already lost, even in Babylonia. The early existence of an accurate system of dating is not surprising; it was necessitated by the fact that Babylonia was a great trading community, in which it was not only needful that commercial and legal documents should be Assyrian, but also that it should be possible to refer easily to the dates of former business transactions. The Babylonian and Assyrian kings had consequently no difficulty in

1 For a survey of the chronological systems adopted by different modern historians, see, for instance, the Systeme Assyrien.

2 The compiler of the more complete one seems to have allowed himself liberties. At all events he gives 30 years of reign to Simuballéli instead of the 20 assigned to him in a list of dates drawn up at the time of Ammi-zadok’s accession, 55 years to Khammurabi instead of 43, and 35 years to Samsuiliana instead of 38, while he omits altogether the seven years’ reign of the Assyrian king Tukulti-Inaristi at Babylon.
determining the age of their predecessors or of past events. Nabonidus (Nabunaid), who was more of an antiquarian than a politician, and spent his time in excavations of the old temples of his country and ascertaining the names of their builders, tells us that Naram-Sin, the son of Sargon of Akkad, lived 3200 years before himself (i.e. 3750 B.C.), and Sargon-akti-suryas 800 years; and we learn from Sennacherib that Shalmaneser I. reigned 600 years earlier, and that Tiglath-pileser I. fought with Merodach-nadin-akhi (Marduk-nadin-akhe) of Babylon 418 years before the campaign of 689 B.C.; while, according to Tiglath-pileser I., the high-priest Samas-Hadad, son of Isme-Dagon, built the temple of Anu and Hadad at Assur 701 years before his own time. Shalmaneser I. in his turn states that the high-priest Samas-Hadad, the son of Bel-kabi, governed Assur 380 years previously, and that 150 years before this the high-priest Erisum was reigning there. The raid of the Elamite king Kutur-Nakhkhunte is placed by Assur-bani-pal 1633 years before his own conquest of Susa, and Khammarabi is said by Nabonidus to have preceded Burna-burys by 700 years.

V. History.—In the earliest period of which we have any knowledge Babylon was divided into several independent states, the limits of which were defined by canals and rivers, and whose inhabitants had been the predecessors of the two main centres, Eridu in the south and Nippur in the north. But the streams of civilization which flowed from them were in strong contrast. El-lil, around whose sanctuary Nippur had grown up, was lord of the ghost-land, and his gifts to mankind were the spells and incantations which the spirits of good or evil were compelled to obey. The world which he governed was a mountain; the creatures whom he had made lived underground. Eridu, on the other hand, was the home of the culture-god Ea, the god of light and beneficence, who employed his divine wisdom in healing the sick and restoring the dead to life. Rising each morning from his palace in the deep, he had given man the arts and sciences, the industries and manners of civilization. To him was due the invention of writing, and the first law-book was his creation. Eridu had once been a seaport, and it was doubtless its foreign trade and intercourse with other lands which influenced the development of its culture. Its cosmology was the result of its geographical position: the earth, it was believed, had grown out of the mud of which it was composed, and its form was the likeness of the Euphrates. Long before history begins, however, the cultures of Eridu and Nippur had coalesced. While Babylon seems to have been a colony of Eridu, Ur, the immediate neighbour of Eridu, must have been colonized from Nippur, since its moon-god was the son of El-lil of Nippur. But in the admixture of the two cultures the influence of Eridu was predominant.

We may call the early civilization of Babylonia Sumerian. The race who first developed it spoke an agglutinative language, and to them was due the invention of the pictorial hieroglyphs which became the running-hand or cuneiform characters of later days, as well as the foundation of the chief cities of the country and the elements of its civilization. The great engineering works by means of which the marshes were drained and the overflow of the rivers regulated by canals went back to Sumerian times, like a considerable part of later Babylonian religion and the beginnings of Babylonian law. Indeed Sumerian continued to be the language of religion and law long after the Semites had become the ruling race.

Arrival of the Semites.—When the Semites first entered the Edin or plain of Babylonia is uncertain, but it must have been at a remote period. The cuneiform system of writing was still in process of growth when it was borrowed and adapted by the new comers, and the Semitic Babylonian language was profoundly influenced by the older language of the country, borrowing its words and even its grammatical usages. Sumerian in its turn borrowed from Semitic Babylonian, and traces of Semitic influence in some of the earliest Sumerian texts indicate that the Semite was already on the Babylonian border. His native home was probably Arabia; hence Eridu (“the good city”) and Ur (“the city”) would have been built in Semitic territory, and their population may have included Semitic elements from the first. It was in the south, however, that the Semites first appear on the monuments. Here in Akkad, upon each person in it, which was founded, Semitic conquerors or settlers spread from Sippara to Susa, Khana to the east of the Tigris was occupied by “West Semitic” tribes, and “out of” Babylon “went forth the Assyrian.” As in Assyria, so too in the states of Babylonia the patesi or high-priest of the god preceded the king. The state had grown up around a sanctuary, the god of which was nominally its ruler, the human patesi being his viceregent. In course of time many of the high-priests assumed the functions and title of king; while retaining their priestly office they claimed at the same time to be supreme in the state in all secular concerns. The god remained nominally at its head; but even this position was lost to him when Babylonia was unified under Semitic princes, and the earthly king became an incarnate god. A recollection of his former power survived, however, at Babylon, where Bel-Merodach adopted the king before his right to rule was allowed.

Early Princes.—The earliest monuments that can be approximatively dated come from Lagash (Tello). Here we hear of a “king of Kengi,” as well as of a certain Me-slim, king of Lagash, who had been the high-priest of Lagash, and the high-priest of a monarchy at “Hamaita.” The city of Kengi was probably Ur-Nina. The ruins of a building, attached by him to the temple of Nin, terra-cotta bas-reliefs of the king and his sons have been found, as well as the heads of lions in onyx, which remind us of Egyptian work and onyx plates. These were “booty” dedicated to the goddess Bau. Eanna-du, the grandson of Ur-Nina, made himself master of the whole of southern Babylonia, including the districts of Sumer together with the cities of Ereh, Ur and Larsa (?). He also annexed the kingdom of Kis, which, however, recovered its independence after his death. Gis-ukh was made tributary, a certain amount of his wealth was paid into the treasury of Nin, and the gods Inguris, the so-called “Stele of the Vultures,” now in the Louvre, was erected as a monument of the victory. On this various incidents in the war are represented. In one scene the king stands in his chariot with a curved weapon in his right hand formed of three bars of metal bound together by rings (similar, as M. L. Heuzay has pointed out, to one carried by the chief of an Asiatic tribe in a tomb of the 13th dynasty at Beni-Hasan in Egypt), while his kilted followers with helmets on their heads and lances in their hands march behind him. In another a flock of vultures is feeding on the bodies of the fallen enemy; in a third a tumult is being heaped up over those who had been slain on the side of Lagash. Elsewhere we see the victorious prince beating down a vanquished enemy, and superintending the execution of other prisoners who are being sacrificed to the gods, while in one curious scene he is striking with his mace a sort of wicker-work cage filled with naked men. In his hand he holds the crest of Lagash and its god—a lion-headed eagle with outstretched wings, supported by two lions which are set heraldically back to back. The sculptures belong to a primitive period of art.

Eanna-du’s campaigns extended beyond the confines of Babylonia. He overran a part of Elam and took the city of Az on the Persian Gulf. Temples and palaces were repaired or erected at Lagash and elsewhere, the town of Nin—which probably gave

---

1 They are also called high-priests of Gunammi and a contract tablet speaks of “Te in Babylon,” but this was probably not the Te of the seal. It must be remembered that the reading of most of the early Sumerian proper names is merely provisional, as we do not know how the ideographs of which they are composed were pronounced in either Sumerian or Assyrian.
its name to the later Ninâ or Nineveh—was rebuilt, and canals and reservoirs were excavated. He was succeeded by his brother En-anna-tum I, under whom Gis-ukh once more became dominant power. As En-anna-tum has the title only of high-priest, it is probable that he acknowledged Ur-lamma of Gis-ukh as his suzerain. His son and successor Entemena restored the prestige of Lagash. Gis-ukh was subdued and a priest named Illi was made its governor. A tripod of silver dedicated by Entemena to his god is now in the Louvre. A frieze of lions devouring ibexes and deer, and incised with great artistic skill, runs round the neck, while the eagle crest of Lagash adorns the globular part. The vase is a proof of the high degree of excellence to which the goldsmith’s art had already attained. A vase of calcite, also dedicated by Entemena, has been found at Nippur.

The eighth successor of Ur-Ninâ was Uru-duggina, who was overthrown and his city captured by Lugal-zaggisi, the high-priest of Gis-ukh. Lugal-zaggisi was the founder of the first empire in Asia of which we know. He made Erech his capital and calls himself king of Keng. In a long inscription which he caused to be engraved on hundreds of stone vases dedicated to El-ll of Nippur, he declares that his kingdom extended “from the Lower Sea of the Tigris and Euphrates,” or Persian Gulf, to “the Upper Sea” or Mediterranean. It was at this time that Erech received the name of the “City,” which it continued to bear when written ideographically.

Semitic Empire of Sargon of Akkad.—The next empire founded in western Asia was Semitic. Semitic princes had already established themselves at Kis, and a long inscription has been discovered at Susa by J. de Morgan, belonging to one of them, Manistusu, who like Lugal-zaggisi was a contemporary of Uru-duggina. Another Semitic ruler of Kis of the same period was Alusarsid (or Urumus) who “subdued Elam and Barâsh.” But the fame of these early establishers of Semitic supremacy was far eclipsed by that of Sargon of Akkad and his son, Naram-Sin. The date of Sargon is placed by Nabonidus at 3800 B.C. He was the son of Ilti-Bel, and a legend related how he had been born in concealment and sent adrift in an ark of bulrushes on the waters of the Euphrates. Here he had been rescued and brought up by “Akki the husbandman”; but the day arrived at length when his true origin became known, the crown of Babylonia was set upon his head and he entered upon a career of foreign conquest. Four times he invaded Syria and Palestine, and spent three years in thoroughly subduing the countries of “the west,” and in uniting them with Babylonia “into a single empire.” Images of himself were erected on the shores of the Mediterranean in token of his victories, and cities and palaces were built at intervals out of the spoils of the conquered lands, Elam and the northern part of Mesopotamia were also subjugated, and rebellions were put down both in Kazalla and in Babylonia itself. Contract tablets have been found dated in the years of the campaigns against Palestine and Sarlik, king of Gutium or Kurdistan, and copper is mentioned as being brought from Magan or the Sinaitic peninsula.

Sargon’s son and successor, Naram-Sin, followed up the successes of his father by marching into Magan, whose king he took captive. He assumed the imperial title of “king of the four zones,” and, like his father, was addressed as a god. He is even called “the god of Agadê” (Akkad), reminding us of the divine honours claimed by the Pharaohs of Egypt, whose territory now adjoined that of Babylonia. A finely executed bas-relief, representing Naram-Sin, and bearing a striking resemblance to early Egyptian art in many of its features, has been found at Diarbeir. Babylonian art, however, had already attained a high degree of excellence; two seal cylinders of the time of Sargon are among the most beautiful specimens of the gem-cutter’s art ever discovered. The empire was bounded, together by roads, along which there was a regular postal service, and clay seals, which took the place of stamps, are now in the Louvre bearing the names of Sargon and his son. A cadastral survey seems also to have been instituted, and one of the documents relating to it states that a certain Uru-Malki, whose name appears to indicate his Canaanitish origin, was governor of the land of the Amorites, as Syria and Palestine were called by the Babylonians. It is probable that the first collection of astronomical observations and terrestrial omens was made for a library established by Sargon.

Bingani-sar-ali was the son of Naram-Sin, but we do not yet know whether he followed his father on the throne. Another son was high-priest of the city of Tutu, and in the name of his daughter, Lipus-Eaum, a priestess of Sin, some scholars have seen that of the Hebrew deity Yahweh. The Babylonian god Ea, however, is more likely to be meant. The fall of Sargon’s empire seems to have been as sudden as its rise. The seat of supreme power in Babylonia was shifted southwards to Isin and Ur. It is generally assumed that two dynasties reigned at Ur and claimed suzerainty over the other Babylonian states, though there is as yet no clear proof that there was more than one. It was probably Gunugunu who succeeded in transferring the capital of Babylonia from Isin to Ur, but his place in the dynasty (or dynasties) is still uncertain.

One of his successors was Ur-Gur, a great builder, who built or restored the temples of the Moon-god at Ur, of the Sun-god at Larsa, of Ishtar at Erech and of Bel at Nippur. His son and successor was Dungi, whose reign lasted more than 35 years, and among whose vassals was Gudea, the high-priest of Lagash. Gudea was also a great builder, and the materials for his statues were brought from all parts of Western Asia, cedar wood from the Anshan mountains, quarried stones from Lebanon, copper from northern Arabia, gold and precious stones from the desert between Palestine and Egypt, dolerite from Magan (the Sinaitic peninsula) and timber from Dilmun in the Persian Gulf. Some of his statues, now in the Louvre, are carved out of Sinaic dolerite, and on the lap of one of them (statue E) is the plan of his palace, with the scale of measurement attached. Six of the statues bore special names, and offerings were made to them as to the statues of the gods. Gudea claims to have conquered Anshan in Elam, and was succeeded by his son Ur-Ningirsu. His date may be provisionally fixed at 2700 B.C.

This dynasty of Ur was Semitic, not Sumerian, notwithstanding the name of Dungi. Dungi was followed by Bur-Sin, Gilim-Sin, and Ibi-Sin. Their power extended to the Mediterranean, and we possess a large number of contemporaneous monuments in the shape of contracts and similar business documents, as well as chronological tables, which belong to their reigns.

After the fall of the dynasty, Babylonia passed under foreign influence. Sumuabu (“Shem is my father”), from southern Arabia (or perhaps Cannaean), made himself master of northern Babylonia, while Elamite invaders occupied the south. After a successful struggle with some unknown state, in the fifth year of whose reign the fortress of Babylon was built, and the city became for the first time a capital. Rival kings, Pungunila, and Immerare, are mentioned in the contract tablets as reigning at the same time as Sumu-la-ilu (or Samu-la-ilu); and under Sin-muballild, the great-grandson of Sumu-la-ilu, the Elamites laid the whole of the country under tribute, and made Eri-Aku or Arloch, called Rim-Sin by his Semitic subjects, king of Larsa. Eri-Aku was the son of Kudur-Mabug, who was prince of Yambutal, on the eastern border of Babylonia, and also “governor of Syria.” The Elamite supremacy was at last shaken off by the son and successor of Sin-muballild, Khammurabi, whose name is also written Ammurapi and Khammumur, and who was the Amraphel of Gen. xiv. 1. The Elamites, under their king Kudur-Lagamar or Chedorlaomer, seem to have taken Babylon and destroyed the temple of Bel-Merodach; but Khammurabi retrieved his fortunes, and in the thirtieth year of his reign (2340 B.C.) he overthrew the Elamites forces in a decisive battle and drove them out of Babylonia. The next two years were occupied in adding Larsa and Yambutal to his dominions, and in forming Babylonia into a single monarchy, the head of which was Babylon. A great literary revival followed the recovery of Babylonian independence, and the rule of Babylon was obeyed as far as the shores of the Mediterranean. Vast numbers of contract tablets, dated in the reigns of Khammurabi and other kings of the dynasty, have
been discovered, as well as autograph letters of the kings themselves, more especially of Khammurabi. Among the latter is one ordering the despatch of 240 soldiers from Assyria and Situllum, a proof that Assyria was at the time a Babylonian dependency. Constant intercourse was kept up between Babylonia and the west, Babylonian officials and troops passing to Syria and Canaan, while "Amorite" colonists were established in Babylonia for the purposes of trade. One of these Amorites, Abi-ramu or Abram by name, is the father of a witness to a deed dated in the reign of Khammurabi's grandfather, Ammi-ditana, the great-grandson of Khammurabi, still entitled himself "king of the land of the Amorites," and both his father and son bear the Canaanitish (and south Arabian) names of Abeshek or Abishua and Ammi-zadok.

One of the most important works of this "First Dynasty of Babylon," as it was called by the native historians, was the compilation of a code of laws (see BABYLONIAN LAW). This was made by order of Khammurabi after the expulsion of the Elamites and the settlement of his kingdom. A copy of the Code has been found at Susa by J. de Morgan and is now in the Louvre. The last king of the dynasty was Samsi-ditana the son of Ammi-zadok. He was followed by a dynasty of 11 Sumerian kings, who are said to have reigned for 368 years, a number which must be much exaggerated. As yet the name of only one of them has been found in a contemporaneous document. They were overthrown and Babylonia was conquered by Kassites or Kossaeans from the mountains of Elam, with whom Samsu-iluna had already come into conflict in his 9th year. The Kassite dynasty was founded by Kandis, Gandis or Gaddas (about 1780 B.C.), and lasted for 576 years. Under this foreign dominion, which offers a striking analogy to the contemporary rule of the Hyksos in Egypt, Babylonia lost its empire over western Asia, Syria and Palestine became independent, and the high-priests of Assur made themselves kings of Assyria. The divine attributes with which the Semitic kings of Babylonia had been invested disappeared at the same time; the title of "god" is never given to a Kassite sovereign. Babylonia, however, remained the capital of the kingdom and the holy city of western Asia, where the priests were all-powerful, and the right to the inheritance of the old Babylonian empire could alone be conferred.

Rise of Assyria.—Under Khammurabi a Samsi-Hadad (or Samsi-Raman) seems to have been vassal-prince at Assur, and the names of several of the high-priests of Assur who succeeded him have been made known to us by the recent German excavations. The foundation of the monarchy was ascribed to Zuliu, who is described as living after Bel-ka-papili or Belkabi (1900 B.C.), the ancestor of Shalmaneser I. Assyria grew in power at the expense of Babylonia, and a time came when the Kassite king of Babylonia was glad to marry the daughter of Assur-yuballid of Assyria, whose letters to Amenophis (Amon-hotep) IV. of Egypt have been found at Tell el-Amarna. The marriage, however, led to disastrous results, as the Kassite faction at court murdered the king and placed a pretender on the throne. Assur-yuballid recovered Babylon and avenged his son-in-law, making Burna-buryas of the royal line king in his stead. Burna-buryas, who reigned 22 years, carried on a correspondence with Amenophis IV. of Egypt. After his death, the Assyrians, who were still nominally the vassals of Babylonia, threw off all disguise, and Shalmaneser I. (1300 B.C.), the great-grandson of Assur-yuballid, openly claimed the supremacy in western Asia. Shalmaneser was the founder of Calah, and his annals, which have recently been discovered at Assur, show how widely extended the Assyrian empire already was. Campaign after campaign was carried on against the Hittites and the wild tribes of the north-west, and Assyrian colonists were settled in Cappadocia. His son Tukulti-In-arii conquered Babylon, putting its king Biltiyanu to death, and thereby made Assyria the mistress of the oriental world. Assyria had taken the place of Babylonia.

For 7 years Tukulti-In-arii ruled at Babylon with the old imperial title of 'king of Sumer and Akkad.' Then the Babylonians revolted. The Assyrian king was murdered by son, Assur-nazir-pal I., and Hadad-nadin-akhi made king of Babylonia. But it was not until several years later, in the reign of the Assyrian king Tukulti-Assur, that a reconciliation was effected between the two rival kingdoms. The next Assyrian monarch, Bel-kudur-uzur, was the last of the old royal line. He seems to have been slain fighting against the Babylonians, who were still under the rule of Hadad-nadin-akhi, and a new dynasty was established at Assur by In-arii-pileser, who claimed to be a descendant of the ancient prince Erba-Raman. His fourth successor was Tiglath-pileser I., one of the great conquerors of Assyria, who carried his arms towards Armenia on the north and Cappadocia on the west; he hunted wild bulls in the Lebanon and was presented with a crocodile by the Egyptian king. In 1107 B.C., however, he sustained a temporary defeat at the hands of Merodach-nadin-akhi (Marduk-nadin-akhi) of Babylonia, where the Kassite dynasty had finally succumbed to Elamite attacks and a new line of kings was on the throne. Among the immediate successors of Tiglath-pileser I. we know little, and it is with Assur-nazir-pal III. (883-858 B.C.) that our knowledge of Assyrian history begins once more to be fairly full. The empire of Assyria was again extended in all directions, and the palaces, temples and other buildings raised by him bear witness to a considerable development of wealth and art. Calah became the favourite residence of a monarch who was distinguished even among Assyrian conquerors for his revolting cruelties. His son Shalmaneser II. had a long reign of 35 years, during which the Assyrian capital was converted into a sort of armed camp. Each year the Assyrian armies marched out of it to plunder and destroy. Babylon was occupied and the country reduced to vassalage. In the west the confederacy of Syrian princes headed by Benhadad of Damascus and including Ahab of Israel (see JESUS, § 10) was shattered in 853 B.C., and twelve years later the forces of Hazael were annihilated and the ambassadors of Jezu of Samaria brought tribute to "the great king." The last few years of his life, however, were disturbed by the rebellion of his eldest son, which well-nigh proved fatal. Assur, Arbela and other places joined the pretender, and the revolt was with difficulty put down by Samsi-Raman (or Samsi-Hadad), Shalmaneser's second son, who soon afterwards succeeded him (824 B.C.). In 804 B.C. Damascus was captured by his successor Hadad-nirari IV., to whom tribute was paid by Samaria.

With Nabu-nazar, the Nabonassar of classical writers, the so-called Canon of Ptolemy begins. When he ascended the throne of Babylon in 747 B.C. Assyria was in the throes of a revolution. Civil war and pestilence were devastating the country, and its northern provinces had been wrested from it by Arrarat. In 746 B.C. Calah joined the rebels, and on the 13th of Iyyar in the following year, Pul or Pul, who took the name of Tiglath-pileser III., seized the crown and inaugurated a new and vigorous policy.

Second Assyrian Empire.—Under Tiglath-pileser III. arose the second Assyrian empire, which differed from the first in its greater consolidation. For the first time in history the idea of centralization was introduced into politics; the conquered provinces were organized under an elaborate bureaucracy at the head of which was the king, each district paying a fixed tribute and providing a military contingent. The Assyrian forces became a standing army, which, by successive improvements and careful discipline, was moulded into an irresistible fighting machine, and Assyrian policy was directed towards the definite object of reducing the whole civilized world into a single empire and thereby throwing its trade and wealth into Assyrian hands. With this object, after terrorizing Armenia and the Medes and breaking the power of the Hittites, Tiglath-pileser III. secured the high-roads of commerce to the Mediterranean together with the Phoenician seaports and then made himself master of Babylonia. In 739 B.C. the summit of his ambition was attained, and he was invested with the sovereignty of Asia in the holy city of Babylon. Two years later, in Tabet...

Egypt had already recovered its independence (560 B.C.) with the help of mercenaries sent by Gyge of Lydia, who had vainly solicited aid from Assyria against his Cimmerian enemies. Next followed the contest with Elam, in spite of the efforts of Assurban-pal to ward it off. Assyria, however, was aided by civil war in Elam itself; the country was wasted with fire and sword, and its capital Susa or Shushan levelled with the ground. But the long struggle left Assyria maimed and exhausted. It had been drained of both wealth and fighting population; the devastated provinces of Elam and Babylon could yield nothing with which to supply the needs of the imperial exchequer, and it was difficult to find sufficient troops even to garrison the conquered populations. Assyria, therefore, was ill prepared to face the hordes of Scythians—or Manda, as they were called by the Babylonians—who now began to harass the frontiers. A Scythian power had grown up in the old kingdom of Ellip, to the east of Assyria, where Ecbatana was built by a "Manda" prince; Asia Minor was infested by the Scythian tribe of Cimmerians, and the death of the Assyrian leader Dugdammē (the Lygdamis of Strabo i. 3. 10) was regarded by Assur-bani-pal as another of his troubles. While Manda's empire was fast breaking up. Under his successor, Assur-etil-ilani, the Scythians penetrated into Assyria and made their way as far as the borders of Egypt. Calah was burned, though the strong walls of Nineveh protected the relics of the Assyrian army which had taken refuge behind them; and when the raiders had passed on to other fields of booty, a new palace was erected among the ruins of the neighbouring city. But its architectural poverty and small size show that the resources of Assyria were at a low ebb. A contract has been found at Sippara, dated in the fourth year of Assur-etil-ilani, though it is possible that his rule in Babylonia was disputed by his Rab-shakeh (vizier), Assur-sum-lisir, whose accession year as king of Assyria occurs on a contract from Nippur (Nifer). The last king of Assyria was probably the brother of Assur-etil-ilani, Sin-sarru-uzur, who seems to have been the Sarakos (Saracus) of Berossus. He was still reigning in Babylonia in his seventh year, as a contract dated in that year has been discovered at Erech, and an inscription of his, in which he speaks of restoring order in the kingdom, is inscribed upon the face of Assurban-pal, king of Babylon, with the name of Assurban-pal in Babylonia, and the name of Merodach of Babylon with Assur of Nineveh, Babylon, however, was again restless. After the overthrow of Nabopolassar, king of Babylon, the Chineladonos of Ptolemy's canon, had been appointed viceroy. His successor was Nabopolassar, whom Nabopolassar, between whom and the last king of Assyria war broke out. The Scythian king of Ecbatana, the Cyaxares of the Greeks, came to the help of the Babylonians. Nineveh was captured and destroyed by the Scythian army, along with those cities of northern Babylonia which had sided with Babylon, and the Assyrian empire was at an end.

The seat of empire was now transferred to Babylon. Nabopolassar was followed by his son Nebuchadrezzar II., whose reign of 43 years made Babylon once more the mistress of the civilized world. Only a small fragment of his annals has been discovered relating to his invasion of Egypt in 567 B.C., and referring to "Eth of the Ionians." Of the reign of the last Babylonian king, Nabonidus, however, and of the conquest of Babylonia by Cyrus, we now have a fair amount of information. This is chiefly derived from a chronological tablet containing the annals of Nabonidus, which is supplemented by an inscription of Nabonidus, in which he recounts his restoration of the temple of the Moon-god at Harran, as well as by a proclamation of Cyrus issued shortly after his formal recognition as king of Babylonia. It was in the sixth year of Nabonidus (549 B.C.)—or perhaps in 553—that Cyrus, "king of Anshan," in Elam, revolted against his suzerain Astyages, king of "the Manda" or Scythians, at Ecbatana. The army of Astyages betrayed him to his enemy, and Cyrus (r.) established himself at Ecbatana, thus putting an end to the empire of the Scythians.
which the Greek writers called that of the Medes, through a
confusion of Madâ or " Medes " with Manda. Three years later we
find that Cyrus has become king of Persia and is engaged in
a campaign in the north of Mesopotamia. Meanwhile Nabonidas
has established a camp at Sippara, near the northern fronter
of his kingdom, his son—probably the Belshazzar of
other inscriptions—being in command of the army.

In 538 B.C. Cyrus invaded Babylonia. A battle was fought
at Opis in the month of June, in which the Babylonians
were defeated, and immediately afterwards Sippara surrendered
to the invader. Nabonidas fled to Babylon, whither he was
pursued by Gobryus, the governor of Kurdistan, and on the
16th of Tammuz, two days after the capture of Sippara, "the
soldiers of Cyrus entered Babylon without fighting." Nabonidas
was dragged out of his hiding-place, and Kurdish guards
were placed at the gates of the great temple of Bel, where the services
continued without intermission. Cyrus did not arrive till the
3rd of Marcheswan (October), Gobryus having acted for him in
his absence. Gobryus was now made governor of the province
of Babylonia, and a few days afterwards the son of Nabonidas,
according to the most probable reading, died. A public mourning
followed, which lasted six days, and Cambyses accompanied the
corpse to the tomb. Cyrus now claimed to be the legitimate
successor of the ancient Babylonian kings and the avenger of
Bel-Merodach, who was wrathful at the impiety of Nabonidas in
removing the images of the local gods from their ancestral shrines
to his capital Babylon. Nabonidas had excited a strong
feeling against himself by attempting to centralize the religion
of Babylonia in the temple of Merodach (Marduk) at Babylon,
and while he had thus alienated the local priesthood the military
party despised him on account of his antiquarian tastes. He
seems to have left the defence of his kingdom to others, occupying
himself with the more congenial work of excavating the founda-
tion records of the temples and determining the dates of their
builders. The invasion of Babylonia by Cyrus was doubtless
facilitated by the existence of a disaffected party in the state,
as well as by the presence of foreign exiles like the Jews, who had

1 The following is a list of the later dynasties and kings of Baby-
lonia and Assyria so far as they are known at present. For the
views of other writers on the chronology, see viii., Chronological
Systems.

been planted in the midst of the country. One of the first acts
of Cyrus accordingly was to allow these exiles to return to their
own homes, carrying with them the images of their gods and their
sacred vessels. The permission to do so was embodied in a
proclamation, in which the conqueror endeavoured to justify
his claim to the Babylonian throne. The feeling was still strong
that none had a right to rule over western Asia until he had been
consecrated to the office by Bel and his priests; and from
henceforth, accordingly, Cyrus assumed the imperial title of
"king of Babylon." A year before his death, in 529 B.C., he
associated his son Cambyses (g.v.) in the government, making
him king of Babylon, while he reserved for himself the fuller
title of "king of the (other) provinces" of the empire. It was
only when Darius Hystaspis, the representative of the Aryan
race and the Zoroastrian religion, had re-conquered the empire
of Cyrus, that the old tradition was broken and the claim of
Babylon to confer legitimacy on the rulers of western Asia
ceased to be acknowledged (see DARIUS). Darius, in fact,
entered Babylon as a conqueror; after the murder of the Magian
it had recovered its independence under Nidinta-Bel, who took the name of Nebuchadrezzar III., and reigned from
October 531 B.C. to August 520 B.C., when the Persians took it
by storm. A few years later, probably 514 B.C., Babylon again
revolted under the Armenian Arakha; on this occasion, after
its capture by the Persians, the walls were partly destroyed.
E-Saggila, the great temple of Bel, however, still continued to
be inhabited; to be a centre of Babylonian patriotism until
at last the foundation of Seleucia diverted the population
to the new capital of Babylon and the ruins of the old city
became a quarry for the builders of the new seat of government.1

VI. Assyria and Babylonia contrasted.—The sister-states of
Babylonia and Assyria differed essentially in character. Babylonia
was a land of merchants and agriculturists; Assyria
was an organized camp. The Assyrian dynasties were founded

by successful generals; in Babylonia it was the priests whom a revolution raised to the throne. The Babylonian king remained a priest to the last, under the control of a powerful hierarchy; the Assyrian king was the autocratic general of an army, at whose side stood in early days a feudal nobility, and from the reign of Tiglath-pileser III. onwards an elaborate bureaucracy. His palace was more sumptuous than the temples of the gods, from which it was quite separate. The people were soldiers and little else; even the sailor belonged to Babylonia. Hence the sudden collapse of Assyria when drained of its fighting population in the age of Assur-bani-pal.

VII. Assyro-Babylonian Culture.—Assyrian culture came from Babylonia, but even here there was a difference between the two countries. There was little in Assyrian literature that was original, and education, which was general in Babylonia, was in the northern kingdom confined for the most part to a single class. In Babylonia it was of very old standing. There were libraries in most of the towns and temples; an old Sumerian proverb averred that "he who would excel in the school of the scribes must rise with the dawn." Women as well as men learned to read and write, and in Semitic times this involved a knowledge of the extinct Sumerian as well as of a most complicated and extensive syllabary. A considerable amount of Semitic Babylonian literature was translated from Sumerian originals, and the language of religion and law long continued to be the old agglutinative language of Chaldaea. Vocabularies, grammars and interlinear translations were compiled for the use of students as well as commentaries on the older texts and explanations of obscure words and phrases. The characters of the syllabary were all arranged and named, and elaborate lists of them were drawn up. The literature was for the most part inscribed with a metal stylus on tablets of clay, called *lteracae cocites* by Pline; the papyrus which seems to have been also employed has perished. Under the second Assyrian empire, when Nineveh had become a great centre of trade, Aramaic—the language of commerce and diplomacy—was added to the number of subjects which the educated class was required to learn. Under the Seleucids Greek was introduced into Babylon, and fragments of tablets have been found with Sumerian and Assyrian (i.e. Semitic Babylonian) words transcribed in Greek letters.

*Babylonian Literature and Science.*—There were many literary works the titles of which have come down to us. One of the most famous of these was the *Epic of Gilgamesh*, in twelve books, composed by a certain Sîn-liqi-unninnī, and arranged upon an astronomical principle. Each division contains the story of a single adventure in the career of Gilgamesh. The whole story is a composite product, and it is possible that some of the stories are artificially attached to the central figure. (See *Gilgamesh, Epic of*.)

Another epic was that of the Creation, the object of which was to glorify Bel-Merodach by describing his contest with Tiamat, the dragon of chaos. In the first book an account is given of the creation of the world out of the primeval deep and the birth of the gods of light. Then comes the story of the struggle between the gods of light and the powers of darkness, and the final victory of Merodach, who clove Tiamat asunder, forming the heaven out of one half of her body and the earth out of the other. Merodach next arranged the stars in order, along with the sun and moon, and gave them laws which they were never to transgress. After this the plants and animals were created, and finally man. Merodach here takes the place of Ea, who appears as the creator in the older legends, and is said to have fashioned man out of the clay.

The legend of Adapa, the first man, a portion of which was found in the record-office of the Egyptian king Amenophis IV. (Akhenaton) at Tell-el-Amarna, explains the origin of death. Adapa while fishing had broken the wings of the south wind, and was accordingly summoned before the tribunal of Anu in heaven. Ea counselled him not to eat or drink there. He followed the advice, and thus refused the food which would have made him and his descendants immortal.

Among the other legends of Babylonia may be mentioned those of Namtar, the plague-demon, of Urta, the pestilence, of Etanna and of Zu. Hades, the abode of Nin-erisgal or Allat, had been entered by Nergal, who, angered by a message sent to her by the gods of the upper world, ordered Namtar to strike off her head. She, however, declared that she would submit to any conditions imposed on her and would give Nergal the sovereignty of the earth. Nergal accordingly relented, and Allatu became the queen of the Infernal World. Etanna conspired with the eagle to fly to the highest heaven. The first gate, that of Anu, was successfully reached; but in ascending still farther to the gate of Ishtar the strength of the eagle gave way, and Etanna was dashed to the ground. As for the storm-god Zu, we are told that he stole the tablets of destiny, and therewith the prerogatives of Bel. God after god was ordered to pursue him and recover them, but it would seem that it was only by a stratagem that they were finally regained.

Besides the purely literary works there were others of the most varied nature, including collections of letters, partly official, partly private. Among them the most interesting are the letters of Khammurabi, which have been edited by L. W. King. Astronomy and astrology, moreover, occupy a conspicuous place. Astronomy was of old standing in Babylonia, and the standard work on the subject, written from an astrological point of view, was translated into Greek by Berossus, was believed to go back to the age of Sargon of Akkad. The zodiac was a Babylonian invention of great antiquity containing eclipses of the sun as well as of the moon could be foretold. Observatories were attached to the temples, and reports were regularly sent by the astronomers to the king. The stars had been numbered and named at an early date, and we possess tables of lunar longitudes and observations of the phases of Venus. In Seleucid and Parthian times the astronomical reports were of a thoroughly scientific character; but how far the advanced knowledge and method they display may reach back we do not yet know. Great attention was naturally paid to the calendar, and we find a week of seven and another of five days in use. The development of astronomy implies considerable progress in mathematics; it is not surprising, therefore, that the Babylonians should have invented an extremely simple method of ciphering or have discovered the convenience of the duodecimal system. The *mer* of 6000 and the *sar* of 3600 were formed from the *suns* or unit of 60, which corresponded with a degree of the equator. Tablets
of squares and cubes, calculated from 1 to 60, have been found at Senkera, and a people who were acquainted with the sun-dial, the clepsydra, the lever and the pulley, must have had no small knowledge of mechanics. A crystal lens, turned on the lathe, was discovered by Layard at Nimrud along with glass vases bearing the name of Sargon; this will explain the excessive minuteness of some of the writing on the Assyrian tablets, and a lens may also have been used in the observation of the heavens.

Art and Architecture.—The culture of Assyria, and still more of Babylonia, was essentially literary; we miss in it the artistic spirit of Egypt or Greece. In Babylonia the abundance of clay and want of stone led to the employment of brick; the Babylonian temples are massive but shapeless structures of crude brick, supported by buttresses, the rain being carried off by drains, one of which at Ur was of lead. The use of brick led to the early development of the pilaster and column, as well as of frescoes and enameled tiles. The walls were brilliantly coloured, and sometimes plated with bronze or gold as well as with tiles. Painted terra-cotta cones were also embedded in the plaster. Assur, in this, as in other matters, the servile pupil of Babylon, built its palaces and temples of brick, though stone was the natural building material of the country, even present building the temple of Niniveh, and other parts of Babylonia, but little noticed in the north. As time went on, however, the later Assyrian architect began to shake himself free from Babylonian influences and to employ stone as well as brick. The walls of the Assyrian palaces were lined with sculptured and coloured slabs of stone, instead of being painted as in Chaldea. We can trace three periods in the art of these bas-reliefs; it is vigorous but simple under Assur-nazir-pal III., careful and realistic under Sargon, refined but wanting in boldness under Assur-bani-pal. In Babylonia, in place of the bas-relief we have the figure in the round, the earliest examples being the statues from Tello which are realistic but somewhat clumsy. The want of stone in Babylonia made every pebble precious and led to a high perfection in the art of gem-cutting. Nothing can be better than two seal-cylinders that have come down to us from the age of Sargon of Akkad. No remarkable specimens of the metallurgical art of an early period have been found, apart perhaps from the silver vases of Entemena, but at a later epoch great excellence was attained in the manufacture of copper. Copper and iron were worked with skill; indeed, it is possible that Babylonia was the original home of copper-working, which spread westward with the civilization to which it belonged. At any rate the people were famous from an early date for their embroiderers and rugs. The ceramic history of Babylonia and Assyria has unfortunately not yet been traced; at Susa alone has the care demanded by the modern methods of archaeology been as yet expended on examining and separating the pottery found in the excavations, and Susa is not Babylonia. We do not even know the date of the spirited terra-cotta reliefs discovered by Loftus and Rawlinson. The forms of Assyrian pottery, however, are graceful; the porcelain, like the glass discovered in the palaces of Nineveh, was derived from Egyptian originals. Transparent glass seems to have been first introduced in the reign of Sargon. Stone as well as clay and glass were employed in the manufacture of vases, and vessels of hard stone have been disinterred at Tello similar to those of the early dynastic period of Egypt.

Social Life.—Castes were unknown in both Babylonia and Assyria, but the priesthood of Babylonia found its counterpart in the military aristocracy of Assyria. The priesthood was divided into a great number of classes, among which that of the doctors may be reckoned. The army was raised, at all events in part, by conscription; a standing army seems to have been first organized in Assyria. Successive improvements were introduced into it by the kings of the second Assyrian empire; chariots were superseded by cavalry; Tigrath-pileser III. gave the riders saddles and high boots, and Sennacherib created a corps of slingers. Tents, baggage-carts and battering-rams were carried on the march, and the tortar or commander-in-chief ranked next to the king. In both countries there was a large body of slaves; above them came the agriculturists and commercial classes, who were, however, comparatively little numerous in Assyria. The scribes, on the other hand, formed a more important class in Assyria than in Babylonia. Both countries had their artisans, money-lenders, poets and musicians.

The houses of the people contained but little furniture; chairs, tables and couches, however, were used, and Assur-bani-pal is represented as reclining on his couch at a meal while his wife sits on a chair beside him. After death the body was usually partially cremated along with the objects that had been buried with it. The cemetery adjoining the city of the living was laid out in streets through which ran rivulets of "pure" water. Many of the tombs, which were built of crude brick, were provided with gardens, and there were shelves or altars on which were placed the offerings to the dead. As the older tombs decayed a fresh city of tombs arose on their ruins. It is remarkable that thus far no cemetery older than the Seleucid or Parthian period has been found in Assyria.

VIII. Chronological Systems.—The extreme divergence in the chronological schemes employed by different writers on the history of Babylonia and Assyria has frequently caused no small perplexity to readers who have no special knowledge of the subject. In this section an attempt is made to indicate briefly the causes which have led to so great a diversity of opinion, and to describe in outline the principles underlying the chief schemes of chronology that have been suggested; a short account will then be given of the latest discoveries in this branch of research, and of the manner in which they affect the problems at issue. It will be convenient to begin with the later historical periods, and then to push our inquiry back into the earlier periods of Babylonian and Sumerian history.

Up to certain points no difference of opinion exists upon the date of the appearance of the later kings who ruled in Babylon and Assyria. The Ptolemaic Canon (11) gives the list of the Babylonian, Assyrian and Persian kings who ruled in Babylon, together with the number of years each of them reigned, from the accession of Nabonassar in 747 B.C. to the conquest of Babylon by Alexander the Great in 331 B.C. The accuracy of this list is confirmed by the larger List of Kings and by the principal Babylonian Chronicle; the latter, like the Canon, begins with the reign of Nabonassar, who, it has been suggested, may have revised the calendar and have inaugurated a new epoch for the later chronology. The Ptolemaic Canon is further controlled and its accuracy confirmed by the Assyrian Eponym Lists, or lists of limmi (see sect. II.), by means of which Assyrian chronology is fixed from 911 B.C. to 666 B.C., the solar eclipse of June 15th, 763 B.C., which is recorded in the eponymy of Pur-Sagale, placing the dead reckoning for these later periods upon an absolutely certain basis. Thus all historians are agreed with regard to the Babylonian chronology back to the year 747 B.C., and with regard to that of Assyria back to the year 911 B.C. It is in respect of the periods anterior to these two dates that different writers have proposed differing systems of chronology, and, as might be imagined, the earlier the period we examine the greater becomes the discrepancy between the systems proposed. This variety of opinion is due to the fact that the data available for settling the chronology often conflict with one another, or are capable of more than one interpretation.

Since its publication in 1884 the Babylonian List of Kings has furnished the framework for every chronological system that has
been proposed. In its original form this document gave a list, arranged in dynasties, of the Babylonian kings, from the First Dynasty of Babylon down to the Neo-Babylonian period. If the text were complete we should probably be in possession of the system of Babylonian chronology current in the Neo-Babylonian period from which our principal classical authorities (see sect. II.) derived their information. The principal points of uncertainty, due to gaps in the text, concern the length of Dynasties IV. and VIII.; for the reading of the figure giving the length of the former is disputed, and the summary at the close of the latter omits to state its length. This omission is much to be regretted, since Nabonassar was the last king but two of this dynasty, and, had we known its duration, we could have combined the information on the earlier periods furnished by the Kings' List with the evidence of the Ptolemaic Canon. In addition to the Kings' List, other important chronological data consist of references in the classical authorities to the chronological system of Berossus (q.e.); chronological references to earlier kings occurring in the later native inscriptions, such as Nabonidus's estimate of the period of Khammurabi (or Hammurabi); synchronisms, also furnished by the inscriptions, between kings of Babylon and of Assyria; and the early Babylonian date-lists.

In view of the uncertainty regarding the length of Dynasties IV. and VIII. of the Kings' List, attempts have been made to ascertain the dates of the earlier dynasties by independent means. The majority of writers, after fixing the date at which Dynasty III. closed by means of the synchronisms and certain of the later chronological references, have accepted the figures of the Kings' List for the earlier dynasties, ignoring their apparent inconsistencies with the system of Berossus and with the chronology of Nabonidus. Others have attempted to reconcile the conflicting data by emendations of the figures and other ingenious devices. This will explain the fact that while the difference between the earliest and latest dates suggested for the close of Dynasty III. is only 144 years, the difference between the earliest and latest dates suggested for the beginning of Dynasty I. is no less than 692 years. A comparison of the principal schemes of chronology that have been propounded may be made by means of the preceding table. The first column gives the names of the writers and the dates at which their schemes were published, while the remaining columns give the dates they have suggested for Dynasties I., II. and III. of the Kings' List.\(^\text{1}\) The systems with the highest dates are placed first in the list; where a writer has produced more than one system, these are grouped together, the highest dates proposed by him determining his place in the series.

\(^\text{1}\) These three dynasties are usually known as the First Dynasty of Babylon, the Dynasty of Sisak or Ururu, and the Kassite Dynasty; see sect. v.

Omitting that of Oppert, which to some extent stands in a category by itself, the systems fall into three groups. The first group, comprising the second to the sixth names, obtains its results by selecting the data on which it relies and ignoring others. The second group, comprising the next four names, attempts to reconcile the conflicting data by emending the figures. The third group, consisting of the last two names, is differentiated by its proposals with regard to Dynasty II. It will be noted that the first group has obtained higher dates than the second, and the second group higher dates on the whole than the third.

Oppert's system\(^\text{8}\) represents the earliest dates that have been suggested. He accepted the figures of the Kings' List and claimed that he reconciled them with the figures of Berossus, though he ignored the later chronological notices. But there is no evidence for his "cyclic date" of 2517 B.C., on which his system depended, and there is little doubt that the beginning of the historical period of Berossus is to be set, not in 2506 B.C., but in 2253 B.C. The two systems of Sayce,\(^\text{4}\) that of Rogers,\(^\text{5}\) the three systems of Winckler,\(^\text{6}\) both those of Delitzsch,\(^\text{7}\) and that of Maspero,\(^\text{8}\) may be grouped together, for they are based on the Kings' List. The first fixed the close of Dynasty III., they employed the figures of the Kings' List unemended for defining the earlier periods, and did not attempt to reconcile their results with other conflicting data. The difference of eighteen years in Sayce's two dates for the rise of Dynasty I. was due to his employing in 1902 the figures assigned to the first seven kings of the dynasty upon the later of the two contemporary date-lists, which had meanwhile been published, in place of those given by the List of Kings. It should be noted that Winckler (1902) and Delitzsch (1897) gives the dates only in round numbers. A second group of systems may be said to consist of those proposed by Lehmann-Haupt, Marquart, Peiser, and Rost, for these writers attempted to get over the discrepancies in the data by emending some of the figures furnished by the inscriptions. In 1891, with the object of getting the total duration of the dynasties to harmonize with the chronological system of Berossus and with the statement of Nabonidus concerning Khammurabi's date, Peiser proposed to emend the figure given by the Kings' List for the length of Dynasty III. The reading of "990 and 36 years," which gives the total 376 years, he suggested was a scribal error for "690 and 39 years"; he thus reduced the length of Dynasty III. by 177 years and effected a corresponding reduction in the dates assigned to Dynasties I. and II.\(^\text{4}\) In 1897 Rost followed up Peiser's suggestion by reducing the figure still further, but he counteracted to some extent the effects of this additional reduction by emending Sennacherib's date for Marduk-nadin-akhhe's defeat of Tiglath-pileser I. as engraved on the rock at Bavian, holding that the figure "418," as engraved upon the rock, was a mistake for "478."\(^\text{9}\) Lehmann-Haupt's first system (1898) resembled those of Oppert, Sayce, Rogers, Winckler, Delitzsch and Maspero in that he accepted the figures of the Kings' List, and did not attempt to emend them. But he obtained his low date for the close of Dynasty III. by emending

Sennacherib's figure in the Bavian inscription; this he reduced by a hundred years,\(^1\) instead of increasing it by sixty as Rost had suggested. Lehmann-Haupt's influence is visible in Marquart's system,\(^2\) published in the following year;\(^3\) it may be noted that his slightly reduced figure for the beginning of Dynasty I. was arrived at by incorporating the new information supplied by the first date-list to be published. When revising his scheme of chronology in 1900, Rost abandoned his suggested emendation of Sennacherib's figure, but by decreasing his reduction of the length of Dynasty III., he only altered his date for the beginning of Dynasty I. by one year.\(^4\) In his revised scheme of chronology, published in 1903,\(^5\) Lehmann-Haupt retained his emendation of Sennacherib's figure, and was in his turn influenced by Marquart's method of reconciling the dynasties of Berossus with the Kings' List. He continued to accept the figures of the Kings' List for Dynasty III., but he reduced the length of Dynasty II. by fifty years, arguing that the figures assigned to some of the reigns were improbably high. His slight reduction in the length of Dynasty I. was obtained from the recently published date-lists, though his proposed reduction of Ammi-zaduqa's reign to ten years has since been disproved.

A third group of systems comprises those proposed by Hommel and Niebuhr, for their reductions in the date assigned to Dynasty I. were effected chiefly by the treatment of Dynasty II. In 1900 Hommel published a new system,\(^6\) in which he set the object of reducing Khammarubi's date, reversed the order of the first two dynasties of the Kings' List, placing Dynasty II. before Dynasty I. In his second and third systems (1895 and 1898),\(^7\) and in his second alternative scheme of 1901 (see below), he abandoned this proposal and adopted a suggestion of Halévy that Dynasty III. followed immediately after Dynasty I.; Dynasty II., he suggested, had either synchronized with Dynasty I., or was mainly apocryphal (eine spätere Geschichtskonstruktion). Niebuhr's system was a modification of Hommel's second theory, for, instead of entirely ignoring Dynasty II., he reduced its independent existence to 143 years, making it overlap Dynasty I. by 225 years.\(^8\) The extremely low dates proposed by Hommel in 1898 were due to his adoption of Peiser's emendation for the length of Dynasty III., in addition to his own elimination of Dynasty II. In 1901 Hommel abandoned Peiser's emendation and suggested two alternative schemes.\(^9\) According to one of these he attempted to reconcile Berossus with the Kings' List by assigning to Dynasty II. an independent existence of some 171 years, while as a possible alternative he put forward what was practically his theory of 1905.

Sennacherib's figure underlaying the various chronological schemes which had, until recently, been propounded. The balance of opinion was in favour of those of the first group of writers, who avoided emendations of the figures and were content to follow the Kings' List and to ignore its apparent discrepancies with other chronological data; but it is now admitted that the general principle underlying the third group of theories was actually nearer the truth. The publication of fresh chronological material in 1906 and 1907 placed a new complex on the problems at issue, and enabled us to correct several preconceptions, and to reconcile or explain the apparently conflicting data.

From a Babylonian chronicle in the British Museum\(^10\) we now know that Dynasty II. of the Kings' List never occupied the throne of Babylon, but ruled only in the extreme south of Babylonia on the shores of the Persian Gulf; that its kings were contemporaneous with the later kings of Dynasty I. and with the earlier kings of Dynasty III. of the Kings' List; that in the reign of Nabonidus, the last king of Dynasty I., Hittites from Cappadocia raided and captured Babylon, which in her weakened state soon fell a prey to the Kassites (Dynasty III.); and that later on southern Babylonia, till then held by Dynasty II. of the Kings' List, was in its turn captured by the Kassites, who from that time onward occupied the whole of the Babylonian plain. The same chronicle informs us that Ilu-shùma, an early Assyrian patesi, was the contemporary of Su-abu, the founder of Dynasty I. of the Kings' List, thus enabling us to trace the history of Assyria back beyond the rise of Babylon.

Without going into details, the more important results of this new information may be summarized: the elimination of Dynasty II. from the throne of Babylon points to a date not much earlier than 2000 or 2050 B.C. for the rise of Dynasty I., a date which harmonizes with the chronological notices of Shalmaneser I.; Nabonidus' estimate of the period of Khammarubi, so far as being centuries too low, is now seen to have been exaggerated, as the context of the passage in his inscription suggests; and finally the beginning of the historical period of Berossus is not to be synchronized with Dynasty II. of the Kings' List, for the figures given in his historical list, and that they have been considered to be in the order found with some earlier dynasty which may possibly have had its capital in one of the other great cities of Babylonia (such as the Dynasty of Isin).

New data have also been discovered bearing upon the period before the rise of Babylon. A fragment of an early dynastic chronicle from Nippur\(^11\) gives a list of the kings of the dynasties of Ur and Isin. From this text we learn that the Dynasty of Ur consisted of five kings and lasted for 177 years, and was succeeded by the Dynasty of Isin, which consisted of sixteen kings and lasted for 225 years. Now the capture of the city of Isin by Rim-Sin, which took place in the seventeenth year of Sin-muballit, the father of Khammarubi, formed an epoch for dating tablets in certain parts of Babylonia,\(^12\) and it is probable that we may identify the fall of the Dynasty of Isin with this capture of the city. In that case the later rulers of the Dynasty of Isin would have been contemporaneous with the earlier rulers of Dynasty I. of the Kings' List, and we obtain for the rise of the Dynasty of Ur a date not much earlier than 2300 B.C.

These considerable reductions in the dates of the earlier dynasties of Babylonia necessarily react upon our estimate of the age of the Dynasties of Ur and Isin, for the 'high dates' of 4000 or 6000 B.C., formerly assigned by many writers to the earliest remains of the Sumerians and the Babylonian Scimites,\(^13\) depended to a great extent on the statement of Nabonidus that 3200 years separated his own age from that of Naram-Sin, the son of Sargon of Agade; for to Sargon, on this statement alone, a date of 3800 B.C. has usually been assigned. But even by postulating the highest possible dates for the Dynasties of Babylon and Ur, enormous gaps occurred in the scheme of chronology, which were unrepresented by any royal name or record. In his valiant attempt to fill these gaps Radu was obliged to invent kings and even dynasties,\(^14\) the existence of which is now definitely disproved. The statement of Nabonidus has not, however, been universally accepted. Lehmann-Haupt suggested an emendation of the text, reducing the number by a thousand years;\(^15\) while Winckler has regarded the statement of Nabonidus as an uncritical exaggeration.\(^16\) Obviously the scribes of Nabonidus were not anxious to diminish the antiquity of the foundation-inscription of Naram-Sin, which their royal master had earheated; and it is possible that it was left as it was and that the 'high dates' are not chronological and are a misreading of certain passages of chronological and Historical Texts ("Bab. Expod., Ser. A, x, 1, dated 1906, published 1907), pp. 46 ff.

Babylonia and Assyria

and another reason for their calculations resulting in so high a figure is suggested by the recent discoveries: they may in all good faith have reckoned as consecutive a number of early dynasties which were as a matter of fact contemporaneous. But, though we may refuse to accept the accuracy of this figure of Nabonidus, it is not possible at present to fix a definite date for the early kings of Agade. All that can be said is that both archaeological and epigraphic evidence indicates that no very long interval separated the empire of the Semitic kings of Agade from that of the kings of Sumer and Akkad, whose rule was inaugurated by the founding of the Dynasty of Ur.1

To use caution in accepting the chronological notices of the later kings is very far removed from suggesting emendations of their figures. The emenders postulate mechanical errors in the writing of the figures, or, equally with those who accept them, regard the calculations of the native scribes as above reproach. But that scribes could make mistakes in their reckoning is definitely proved by the discovery at Shergat of two totally conflicting accounts of the age and history of the great temple of Assur.2 This discovery in itself suggests that all chronological data are not to be treated as of equal value and arranged mechanically like the pieces of a Chinese puzzle; and further, that no more than a provisional acceptance should be accorded any statement of the later native chronologists, until confirmed by contemporary records. On the other hand, the death-blow has been given to the principle of emendation of the figures, which for so long has found favour among a considerable body of German writers.

IX. Proper Names.—In the early days of the decipherment of the cuneiform inscriptions, the reading of the proper names borne by Babylonians and Assyrians occasioned great difficulties; and though most of these difficulties have been overcome and there is general agreement among scholars as to the principles underlying both the formation and the pronunciation of the thousands of names we encounter in historical, literary, business, and religious documents, votive inscriptions and literary productions, differences, though mostly of a minor character, still remain. Some time must elapse before absolute uniformity in the transliteration of these proper names is to be expected; and since different scholars still adopt varying spellings of Babylonian and Assyrian proper names, it has been considered undesirable in this work to ignore the fact in individual articles contributed by them. The better course seems to be to explain here the nature of these variations.

The main difficulty in the reading of Babylonian and Assyrian proper names arises from the preference given to the "ideographic" method of writing them. According to the developed cuneiform system of writing, words may be written by means of a sign for combination of signs) expressive of the entire word, or they may be spelled out phonetically in syllables. So, for example, the word for "name" may be written by a sign MU, or it may be written out by two signs sunku, the one sign MU representing the "Sumerian" word for "name," which, however, in the case of a Babylonian or Assyrian text must be read as sumu—the Semitic equivalent of the Sumerian MU. Similarly the word for "clothing" may be written SIG-BA, which represents again the "Sumerian" word, whereas, the Babylonian-Assyrian equivalent being labu-shutu it is so to be read in Semitic texts, and may therefore be also phonetically written lu-bu-ushtu. This double method of writing words arises from the circumstance that the cuneiform syllabary is of non-Semitic origin, the system being derived from the non-Semitic settlers of the Euphrates valley, commonly termed Sumerians (or Sumerio-Akkadians), to whom, as the earlier settlers, the origin of the cuneiform script is due. This script, together with the general Sumerian culture, was taken over by the Babylonians upon their settlement in the Euphrates valley and adapted to their language, which belonged to the Semitic group. In this transfer the Sumerian words—largely monosyllabic—were reproduced, but read as Semitic, and

at the same time the advance step was taken of utilizing the Sumerian words as means of writing the Babylonian words phonetically. In this case the signs representing Sumerian words were treated merely as syllables, and, without reference to their meaning, utilized for spelling Babylonian words. The Babylonian syllabary which thus arose, and which, as the culture passed on to the north—known as Assyria—became the Babylonian Assyrian syllabary,3 was enlarged and modified in the course of time, the Semitic equivalents for many of the signs being distorted or abbreviated to form the basis of new "phonetic" values that were thus of "Semitic" origin; but, on the whole, the "non-Semitic" character of the signs used as syllables in the phonetic method of writing Semitic words was preserved; and, furthermore, down to the latest days of the Babylonian and Assyrian empires the mixed method of writing continued, though there were periods when "purism" was the fashion, and there was a more marked tendency to spell out the words laboriously in preference to using signs with a phonetic complement as an aid in forming the readings desired in any given instance. Yet, even in those days, the Babylonian syllabary continued to be a mixture of ideographic and phonetic writing. Besides the conventional use of certain signs as the indications of names of gods, countries, cities, vessels, birds, trees, &c., which, known as "determinants," are the Sumerian signs of the terms in question and were added as a guide for the reader, proper names more particularly continued to be written to a large extent in purely "ideographic" fashion. The conservatism which is a feature of proper names everywhere, in consequence of which the archaic traits of a language are frequently preserved in them, just as they are preserved in terms used in the ritual and in poetical diction, is sufficient to account for the interesting fact that the Semitic settlers of the Euphrates valley in handing down their names from one generation to another retained the custom of writing them in "Semitic" fashion, or, as we might also put it, in "ideographic" fashion for the most part, as an element in a large proportion of the proper names,4 was almost invariably written with the sign or signs representing this deity, and it is only exceptionally that the name is spelled phonetically. Thus the name of the chief god of the Babylonian pantheon, Marduk, is written by two signs to be pronounced AMAR-UD, which describe the god as the "young bullock of the day"—an allusion to the solar character of the god in question. The moon-god Sin is written by a sign which has the force of "thirty," and is a distinct reference to the monthly course of the planet; or the name is written by two signs to be pronounced EN-ZU, which describe the god as the "lord of wisdom." The god Neba appears as PA—the sign of the stylus, which is associated with this deity as the originator and patron of writing and of knowledge in general,—or it is written with a sign AK, which describes the god as a "creator."

Until, therefore, through parallel passages or through explanatory lists prepared by the Babylonian and Assyrian scribes in large numbers as an aid for the study of the language,5 the exact phonetic reading of these divine names was determined, scholars remained in doubt or had recourse to conjectural or provisional readings. Even at the present time there are many names of deities, as, e.g. Ninib, the phonetic reading of which is still unknown or uncertain. In most cases, however, these belong to the category of minor deities or represent old local gods assimilated to some more powerful god, who absorbed, as it were, the attributes and prerogatives of these minor ones. In many cases they will probably turn out to be descriptive epithets of gods

3 Cf. L. W. King, Chronicles, I. pp. 55 ff., 61 f.
4 Aramaic endorsements on business documents repeating in Aramaic transliteration the names of parties mentioned in the texts have also been of service in fixing the phonetic readings of names. See e.g. Clay's valuable article, "Aramaic Endorsements on the Documents of Murash Sons" (Persian period) in Old Testament and Semitic Studies in Memory of William Rainey Harper (Chicago, 1908, vol. I.), pp. 285-322.

8 The Assyrian language is practically identical with the Babylonian, just as the Assyrians are the same people as the Babylonians with some foreign admixtures.

In many names the divine element is lopped off, but was originally present.

3 Aramaic endorsements on business documents repeating in Aramaic transliteration the names of parties mentioned in the texts have also been of service in fixing the phonetic readings of names. See e.g. Clay's valuable article, "Aramaic Endorsements on the Documents of Murash Sons" (Persian period) in Old Testament and Semitic Studies in Memory of William Rainey Harper (Chicago, 1908, vol. I.), pp. 285-322.
BABYLONIAN AND ASSYRIAN RELIGION

already known rather than genuine proper names. A peculiar difficulty arises in the case of the god of storms, who, written IM, was generally known in Babylon as Ramman, "the thunderer," whereas in Assyria he also had the designation Ad, in many cases, therefore, we may be in doubt how the sign IM is to be read, more particularly since this same god appears to have had other designations besides Ramman and Ad.

Besides the divine element, proper names as a rule in the Babylonian-Assyrian period had a verbal form attached and a third element representing an object. Even when the sign indicative of the verb is clearly recognised there still remains to be determined the form of the verb intended. Thus in the case of the sign KUR, which is the equivalent of nāsār, "protect," there is the possibility of reading it as the active participle nāsār, or as an imperative nāsūr, or even the third person perfect nāsār. Similarly in the case of the sign MUN, which, besides signifying "name," as above pointed out, is also the Sumerian word for "give," and therefore may be read sādin, "he gave," from nādānu, or may be read nādin, "giver"; and when, as actually happens, a name occurs in which the first element is the name of a deity followed by MUN, a new element of doubt is introduced through the uncertainty whether the first MU is to be taken as a form of the verb nādānu and the second as the noun shumu, "name," or vice versa.

Fortunately, in the case of a large number of names occurring on business documents as the interested parties or as scribes or as witnesses—and it is through these documents that we obtain the majority of the Babylonian-Assyrian proper names—we have variant readings, the same name being written phonetically in whole or part in one instance and ideographically in another. Certain classes of names being explained in this way, legitimate and fairly reliable conclusions can be drawn for many others belonging to the same class or group. The proper names of the numerous business documents of the Khammurabi period, when phonetic writing was the fashion, have been of special value in resolving doubts as to the correct reading of names written ideographically. Thus names like Sin-na-di-in-shu-mi and Bel-na-di-in-shu-mi, i.e., "Sin is the giver of a name" (i.e., offspring), and "Bel is the giver of a name," form the model for names with deities as the first element followed by MUN, even though the model may not be consistently followed in all cases. In historical texts also variant readings occur in considerable number. Thus, to take a classic example, the name of the famous king Nebuchadrezzar occurs written in the following different manners:—(a) Na-bi-um-ka-du-ur-si-ur, (b) AK-DU u-šu-ur, (c) AK-du-rat-ri-SHES, and (d) PA-GAR-DU-SHES, from which we are permitted to conclude that PA or AK (with the determinative for deity AN) = Na-bi-um or Nebo, that GAR-DU or DU alone = kudurri, and that SHES = utu-ur. The second element signifies "boundary" or "territory," the third element is the imperative of nāsār, "protect," so that the whole name signifies, "O, Nebo protect my boundary" (or "my territory").

It is not the purpose of this note to set forth the principles underlying the formation of proper names among the Babylonians and Assyrians, but it may not be out of place to indicate that by the side of such full names containing three elements for even modern names we have already in an early period the reduction of these elements to two through the combination of the name of a deity with a verbal form merely, or through the omission of the name of the deity. From such names it is only a step to names of one element, a characteristic feature of which is the frequent addition of an ending -um (feminine), ãn, ãm, umum, atiša, sha, &c., most of these being "hypocoristic affixes," corresponding in a measure to modern pet-names.

Lastly, a word about genuine or pseudo-Sumerian names. The in the case of the texts from the oldest historical periods we encounter hundreds of names that are genuinely Sumerian, and, here in view of the multiplicity of the phonetic values attaching to the signs used it is frequently difficult definitely to determine the reading of the names. Our knowledge of the ancient Sumerian language is still quite imperfect, despite the considerable progress made, particularly during recent years. It is therefore not surprising that scholars should differ considerably in the reading of Sumerian names, where we have not always our command as for Babylonian and Assyrian names. Changes in the manner of reading the Sumerian names are frequent. Thus the name of a king of Ur, generally read Ur-Bau until quite recently, is now read Ur-Engur; for Lugalsaggis, a king of Ezech, some scholars still prefer to read Ungal-zaggisi; the name of a famous political and religious centre generally read Shir-pur-la is more probably to be read Shir-gul-la; and so forth. There is reason, however, to believe that the uncertainty in regard to many of these names will eventually be resolved into reasonable certainty. A doubt also still exists in regard to a number of names of the older period because of the uncertainty whether their bearers were Sumerians or Semites. If the former, then their names are surely to be read as Sumerian, while, if they were Semites, the signs with which the names are written are probably to be read according to their Semitic equivalents, though we may also expect to encounter Semites bearing genuine Sumerian names.

The case of a doubt as to whether a name whose bearing was a Semite, whether the signs composing his name represent a phonetic reading or an ideographic compound. Thus, e.g., when inscriptions of a Semitic ruler of Kish, whose name was written Uru-mu-ush, were first deciphered, there was a disposition to regard this as an ideographic form and to read phonetically Alu-usarushid ("he founded a city," with the omission of the name of the deity), but scholarly opinion finally accepted Uru-mu-ush (Urussur) as the correct designation.

For further details regarding the formation of Sumerian and Babylonian-Assyrian proper names, as well as for an indication of the problems involved and the difficulties still existing, especially in the case of Sumerian names, we refer the reader to the three excellent works now at our disposal for the Sumerian, the old Babylonian, and the neo-Babylonian period respectively, by Huber, Die Personennamen in den Keilschrifturkunden aus der Zeit der Könige von Ur und Nizzur (Leipzig, 1907); Runke, Early Babylonian Proper Names (Philadelphia, 1905); and Tallqvist, Neubabylonisches Namenbuch (Helsingfors, 1906).
BABYLONIAN AND ASSYRIAN RELIGION

Babylon itself came to be recognized as the real centre of the entire Euphrates valley.

Associated with Marduk was his consort Sarpanit, and grouped around the pair as princes around a throne were the chief deities of the older centres, like Ea and Damkina of Eridu, Nebo and Tashmit of Borsippa, Nergal and Allatu of Kutha, Shamash and of Sippar, Sin and Ningal of Ur, as well as pairs like Ramman (or Adad) and Shala whose central seat is unknown to us. In this process of accommodating ancient prerogatives to new conditions, it was inevitable that attributes belonging specifically to the one or the other of these gods should have been transferred to Marduk, who thus from being, originally, a solar deity becomes an ecletic power, taking on the traits of Bel, Ea, Shamash, Nergal, Adad and even Sin (the moon-god)—a kind of composite residue of all the chief gods.

In the religious literature this process can be traced with perfect definiteness. The older incantations, associated with Ea, were re-edited so as to give to Marduk the supreme power over demons, witches and sorcerers. Other incantations composed for the cult of Bel, Shamash and of Adad were transformed into paems and appeals to Marduk, while the ancient myths arising in the various religious and political centres underwent a similar process of adaptation to changed conditions, and as a consequence their original meaning was obscured by the endeavour to assign all mighty deeds and acts, originally symbolical of the change of seasons or of occurrences in nature, to the patron deity of Babylon—the supreme head of the entire Babylonian pantheon. Besides the chief deities and their consorts, various minor ones, representing likewise patron gods of less important localities and in most cases of a solar character were added at one time or the other to the court of Marduk, though there is also to be noted a tendency on the part of the chief solar deity, Shamash of Sippara, and for the chief moon-god to absorb the solar and lunar deities of less important sites, leading in the case of the solar gods to the differentiation of the functions of Shamash during the various seasons of the year and the various times of the day among these minor deities. In this way Ninih, whose chief seat appears to have been at Shirgulla (Lagash), became the sun-god of the springtime and of the morning, bringing joy and new life to the earth, while Nergal of Kutha was regarded as the sun of the summer solstice and of the noontide heat—the harbinger of suffering and death.

There were, however, two deities who appear to have retained an independent existence—Anu (q.v.), the god of heaven, and Ishtar (q.v.), the great mother-goddess, who symbolized fertility and vitality in general. There are some reasons for believing that the oldest seat, and possibly the original seat, of the Anu cult was in Erech, as it is there where the Ishtar cult that subsequently spread throughout Babylonia and Assyria took its rise. While Anu, with whom there was associated as a pale reflection a consort Antum, assigned to him under the influence of the widely prevalent view among the early Semites which conceived of gods always in pairs, remained more or less as an abstraction during the various periods of the Babylonian-Assyrian religion and taking little part in the active cult of the temples, his unique position as the chief god of the highest heavens was always recognized in the theological system developed by the priests, which found an expression in making him the first figure of a triad, consisting of Anu, Bel and Ea, among whom the priests divided the three divisions of the universe, the heavens, the earth with the atmosphere above it, and the watery expanse respectively.

Postponing the discussion of this triad, it is to be noted that the systematization of the pantheon after the days of Kham- munishi did not seriously interfere with the independence of the goddess Ishtar. While frequently associated with Marduk, and still more closely with the chief god of Assyria, the god Assur (who occupies in the north the position accorded to Marduk in the south), so much so as to be sometimes spoken of as Assur’s consort—the lady or Belit par excellence—the belief that as the source of all life she stands apart never lost its hold upon the people and found an expression also in the system devised by the priests. By the side of the first triad, consisting of Anu, Bel and Ea—disconnected in this form entirely from all local associations—we encounter a second triad composed of Shamash, Sin and Ishtar. As the first triad symbolized the three divisions of the universe—the heavens, earth and the watery element—so the second represented the three great forces of nature—the sun, the moon and the life-giving power. According as the one or the other aspect of such a power is brought into the foreground, Ishtar becomes the mother of mankind, the fertile earth, the goddess of sexual love, and the creative force among animals, while at times she appears in hymns and myths as the general personification of nature.

We thus find in the post-Khammurabic period the pantheon assuming distinct shapes. The strong tendency towards concentrating in one deity—Marduk—the attributes of all others was offset by the natural desire to make the position of Marduk accord with the rank acquired by the secular rulers. As these established the supremacy of their gods around them a court of loyal attendants dependent in rank and ready to do their master’s bidding, so the gods of the chief centres and those of the minor local cults formed a group around Marduk; and the larger the group the greater was the reflected glory of the chief figure. Hence throughout the subsequent periods of Babylonian history, and despite a decided progress towards a monotheistic conception of divine government of the universe, the recognition of a large number of gods and their consorts by the side of Marduk remained a firmly embedded doctrine in the Babylonian religion as it did in the Assyrian religion, with the important variation, however, of transferring the rôle of the head of the pantheon from Marduk to Assur. Originally the patron god of the city of Assur (q.v.), when this city became the centre of a growing and independent district, Assur was naturally advanced to the same position in the north that Marduk occupied in the south. The religious predominance of the city of Babylon served to maintain for Marduk recognition even on the part of the Assyrian rulers; who, on the political side likewise, conceded to Babylonia the form at least of an independent district even when, as kings of Assyria, they exercised absolute control over it. They appointed their sons or brothers governors of Babylonia, and in the long array of titles that the kings gave themselves, a special phrase was always set aside to indicate their mastery over Babylonia. “To take the hand of Bel-Marduk” was the ceremony of installation which Assyrian rulers recognized equally with Babylonians as an essential preliminary to exercising authority in the Euphrates valley. Marduk and Assur became rivals only when Babylonia gave the Assyrians trouble; and when in 689 B.C. Senacherib, whose patience had been exhausted by the difficulties encountered in maintaining peace in the south, actually besieged and destroyed the city of Babylon, he removed the statue of Marduk to Nineveh as a symbol that the god’s rule had come to an end. His grandson Assur-bani-pal, with a view of re-establishing amicable relations, restored the statue to the temple E-Saggila in Babylon and performed the time-honoured ceremony of “taking the hand of Bel” as a symbol of his homage to the ancient head of the Babylonian pantheon.

But for the substitution of Assur for Marduk, the Assyrian pantheon was the same as that set up in the south, though some of the gods were endowed with attributes which differ slightly from those which mark the same gods in the south. The warlike nature of the Assyrians was reflected in their conceptions of the gods, who thus became little Assurs by the side of the great protector of arms, the big Assur. The cult and ritual in the north likewise followed the models set up in the south. The hymns composed for the temples of Babylonia were transferred to Assur, Calah, Harran, Arbel and Nineveh in the north; and the myths and legends also wandered to Assyria, where, to be sure, they underwent certain modifications. To all practical purposes, however, the religion of Assyria was identical with that practiced in the south.

We thus obtain four periods in the development of the Babylonian-Assyrian religion: (1) the oldest period from
BABYLONIAN AND ASSYRIAN RELIGION

c. 3500 B.C. to the time of Khammurabi (c. 2350 B.C.); (2) the post-Khammurabic period in Babylonia; (3) the Assyrian period (c. 2000 B.C.) to the destruction of Nineveh in 669 B.C.; (4) the neo-Babylonian period beginning with Nabopolassar (625–604 B.C.), the first independent ruler under whom Babylon inaugurates a new epoch after the short-lived era of power and prosperity, which ends with Cyrus’s conquest of Babylon and Babylonia in 539 B.C., though since the religion proceeds on its undisturbed course for several centuries after the end of the political independence, we might legitimately carry this period to the Greek conquest of the Euphrates valley (331 B.C.), when new influences began to make themselves felt which gradually led to the extinction of the old cults.

In this long period of c. 3500 to c. 300 B.C., the changes introduced after the adjustment to the new conditions produced by Khammurabi’s union of the Euphrates states are of a minor character. As already indicated, the local cults in the important centres of the south and north maintained themselves despite the tendency towards centralization, and while the cults themselves varied according to the character of the gods worshipped in each centre, the general principles were the same and the rites differed in minor details rather than in essential variations. An important factor which thus served to maintain the rites in a more or less stable condition was the predominance of what may be called the astral theology as the theoretical substratum of the State-religion which was pronounced in the religious system of Assyria. The essential feature of this astral theology is the assumption of a close link between the movements going on in the heavens and occurrences on earth, which led to identifying the gods and goddesses with heavenly bodies—planets and stars, besides sun and moon—and to assigning the seats of all the deities in the heavens. The personification of the two great luminaries—the sun and the moon—was the first step in the unfolding of this system, and this was followed by placing the other deities where Shamash and Sin had their seats. This process, which reached its culmination in the post-Khammurabic period, led to identifying the planet Jupiter with Marduk, Venus with Ishtar, Mars with Nergal, Mercury with Nebo, and Saturn with Ninib. The system represents a harmonious combination of two factors, one of popular origin, the other the outcome of speculation in the schools attached to the temples of Babylonia. The popular factor is the belief in the influence exerted by the movements of the heavenly bodies on occurrences on earth—a belief naturally suggested by the dependence of life, vegetation and guidance upon the two great luminaries. The mystery-rituals and the prayers of the priests built up the elements of the close correspondence between occurrences on earth and phenomena in the heavens. The heavens presenting a constant change even to the superficial observer, the conclusion was drawn of a connexion between the changes and the ever-changing movement in the fate of individuals and of nature as well as in the appearance of nature.

To read the signs of the heavens was therefore to understand the meaning of occurrences on earth, and with this accomplished it was also possible to foretell what events were portended by the position and relationship to one another of sun, moon, planets and certain stars. Myths that symbolized changes in season or occurrences in nature were projected on the heavens, which were mapped out to correspond to the divisions of the earth. All the gods, great and small, had their places assigned to them in the heavens, and facts, including such as fell within the domain of political history, were interpreted in terms of astral theology. So completely did this system in the course of time sway men’s minds that the cult, from being an expression of animistic beliefs, took on the colour derived from the “astral” interpretation of occurrences and doctrines. It led its trace in incantations, omens and hymns, and it gave birth to astronomy, which was assiduously cultivated because a knowledge of the heavens was the very foundation of the system of belief unfolded by the priests of Babylonia and Assyria. “Chaldean wisdom” became in the classical world the synonym of this science, which in its character was so essentially religious. The persistent prominence which astrology (q.v.) continued to enjoy down to the border-line of the scientific movement of our own days, and which is directly traceable to the divination methods perfected in the Euphrates valley, is a tribute to the scope and influence attached by the astral theology of the Babylonian and Assyrian priests.

As an illustration of the manner in which the doctrines of the religion were made to conform to the all-pervading astral theory, it will be sufficient to refer to the modification undergone in this process of the view developed in a very early period which apportioned the control of the universe among the three gods Anu, Bel and Ea. Disassociating these gods from all local connexions, Anu became the power presiding over the heavens, to Bel was assigned the earth and the atmosphere immediately above it, while Ea ruled over the deep. With the transfer of all the gods to the heavens, and under the influence of the doctrine of the correspondence between the heavens and the earth, Anu, Bel and Ea became the three “ways” (as they are called) on the heavens. The “ways” appear in this instance to have been the designation of the ecliptic circle, which was divided into three sections or zones—a northern, a middle and a southern zone. Anu being assigned to the first, Bel to the second, and Ea to the third zone. The astral theology of the Babylonian-Assyrian religion, while thus bearing the ear-marks of a system devised by the priests, succeeded in assimilating the beliefs which represented the earlier attempts to systematize the more popular divination practices. The astral elements was secured that led to interpreting the contents and the form of the religion in terms of the astral-theological system.

The most noteworthy outcome of this system in the realm of religious practice was, as already intimated, the growth of an elaborate and complicated method of divining the future by the observation of the phenomena in the heavens. It is significant that in the royal collection of cuneiform literature made by King Assur-bani-pal of Assyria (668–626 B.C.) and deposited in his palace at Nineveh, the omens collections connected with the astral theology of Babylonia and Assyria form the largest class. There are also indications that the extensive texts dealing with divination through the liver of sacrificial animals, which represents a more popular origin than divination through the observations of the heavens, based as it is on the primitive view which regarded the liver as the seat of life and of the soul, were brought into connexion with astral divination. Less influenced by the astral-theological system are the old incantation texts which were gathered together into series. In these series we can trace the attempt to gather the incantation formulæ and prayers produced in different centres, and to give them form to the tendency to centralize the cult in the worship of Marduk and his consort in the south, and of Assur and Ishtar in the north. Incantations originally addressed to Ea of Eridu, as the god of the watery element, and to Nusku, as the god of fire, were transferred to Marduk. This was done by making Ea confer on Marduk as his son the powers of the father, and by making Nusku a messenger between Ea and Marduk. At the same time, since the invoking of the divine powers was the essential element in the incantations, in order to make the magic formulæ as effective as possible, a large number of the old local deities are introduced to add their power to the chief ones; and it is here that the astral system comes into play through the introduction of names of stars, as well as through assigning attributes to the gods which clearly reflect the conception that they have their seats in the heavens. The incantations pass over naturally into hymns and prayers. The connexion between the two is illustrated by the application of the term šiptu, “incantation,” to the direct appeals to the gods, as well as by the introduction, on the one hand, of genuine prayers into the incantations and by the addition, on the other the notation of incantations to prayers and hymns, pure and simple. In another division of the religious literature of Babylonia which is largely represented in Assur-bani-pal’s collection—the myths and legends—tales which originally symbolized the change of seasons, or in which historical occurrences are overlaid with more or less copious
admixiture of legend and myth, were transferred to the heavens, and so it happens that creation myths, and the accounts of wanderings and exploits of the heroes of the past, are referred to in myths among the planets and stars as well as to occurrences or supposed occurrences on earth.

The ritual alone which accompanied divination practices and incantation formulae was a chief factor in the celebration of festival days and of days set aside for one reason or the other to the worship of some god or goddess or group of deities, is free from traces of the astral theology. The more or less elaborate ceremonies prescribed for the occasions when the gods were approached are directly connected with the popular elements of the religion. Animal sacrifice, libations, ritualistic purification, sprinkling of water, and symbolical rites of all kinds accompanied by short prayers, represent a religious practice which in the Babylonian-Assyrian religion, as in all religions, is older than any theology and survives the changes which the theoretical substratum of the religion undergoes.

On the ethical side, the religion of Babylonia more particularly, and to a less extent that of Assyria, advances to noticeable conceptions of the qualities associated with the gods and goddesses and of the duties imposed on man. Shamash the sun-god was invested with justice as his chief trait, Marduk is portrayed as full of mercy and kindness, Ea is the protector of mankind who is warned when, through a deception practised upon Adapa, humanity is deprived of immortality. The gods, to be sure, are credited with various traits, but the divine element predominated, but the view becomes more and more pronounced that there is some cause always for the divine wrath. Though, in accounting for the anger of the gods, no sharp distinction is made between moral offences and a ritualistic oversight or neglect, yet the stress laid in the hymns and prayers, as well as in the elaborate atonement ritual prescribed in order to appease the anger of the gods, on the need of being clean and pure in the sight of the higher powers, the inculcation of a proper aspect of humility, and above all the need of confessing one's guilt and sins without any reserve—all this bears testimony to the strength which the ethical factor acquired in the domain of the religion.

This factor appears to less advantage in the unfolding of the views concerning life after death: Throughout all periods of Babylonian-Assyrian history, the conception prevailed of a large dark cavern below the earth, not far from the Apsu—the ocean encircling and flowing underneath the earth—in which all the dead were gathered and where they led a miserable existence of inactivity amid gloom and dust. Occasionally a favoured individual was permitted to escape from this eternal state and placed in a pleasant island. It would appear also that the rulers were always singled out for divine grace, and in the earlier periods of the history, owing to the prevailing view that the rulers stood nearer to the gods than other mortals, the kings were divined after death, and in some instances divine honours were paid to them even during their lifetime.

The influence exerted by the Babylonian-Assyrian religion was particularly profound on the Semites, while the astral theology affected the ancient world in general, including the Greeks and Romans. The impulse to the purification of the old Semite religion to which the Hebrews for a long time clung in common with their fellows—the various branches of nomadic Arab—was largely furnished by the remarkable civilization unfolded in the Euphrates valley and in many of the traditions, myths and legends embodied in the Old Testament; traces of direct borrowing from Babylonia may be discerned, while the indirect influences in the domain of the prophetical books, as also in the Psalms and in the so-called "Wisdom Literature," are even more noteworthy.

Even when we reach the New Testament period, we have not passed entirely beyond the sphere of Babylonian-Assyrian influences. In such a movement as early Christian gnosticism, Babylonian elements—modified, to be sure, and transformed—are largely present, while the growth of an apocalyptic literature is ascribed with apparent justice by many scholars to the recrudescence of views the ultimate source of which is to be found in the astral-theology of the Babylonian and Assyrian priests.

Babylonian Captivity, the name generally given to the deportation of the Jews to Babylon by Nebuchadrezzar. Three separate occasions are mentioned (Jer. iii. 18–39). The first was in the time of Jehoiachin, a few years after Nebuchadrezzar had subjugated the surrounding nations, and a number of the leading citizens were removed. After eleven years (in the reign of Zedekiah) a fresh rising of the Judeans occurred; the city was razed to the ground, and a further deportation ensued. Finally, five years later, Jeremiah (loc. cit.) records a third captivity. After the overthrow of Babylonia by the Persians, Cyrus gave the Jews permission to return to their native land (357 B.C.), and more than forty thousand are said to have availed themselves of the privilege. (See JERUSALEM; JERUSALEM; ZEDEKIAH; EZRA-NEHEMIAH AND JEWS: History.)

Babylonian Law. The material for the study of Babylonian law is singularly extensive without being exhaustive. The so-called "contracts," including a great variety of deeds, conveyances, bonds, receipts, accounts and, most important of all, the actual legal decisions given by the judges in the law courts, exist in thousands. Historical inscriptions, royal charters and despatches, private letters and the general literature afford welcome supplementary information. Even grammatical and lexigraphical works, intended solely to facilitate the study of ancient literature, contain many extracts or short sentences bearing on law and custom. The so-called "Sumerian Family Laws" are thus preserved. The discovery of the now celebrated Code of Hammurabi (Hammurabi),[1] hereafter simply termed

[1] For the transliteration of Babylonian and Assyrian names generally, see BABYLONIA AND ASSYRIA, section ix., Proper Names.
BABYLONIAN LAW

"the Code" has, however, made a more systematic study possible than could have resulted from the classification and interpretation of the other material. Some fragments of a later code exist and have been published; but there still remain many points upon which we have no evidence.

This material dates from the earliest times down to the commencement of our era. The evidence upon a particular point may be very full at one period and almost entirely lacking at another. The Code forms the backbone of the skeleton sketch which is here reconstructed. The fragments of it which have been recovered from Assur-bani-pal's library at Nineveh and later Babylonian copies show that it was studied, divided into chapters entitled Ninsu ilu sirum from its opening words, and recopied for fifteen hundred years or more. The greater part of it remained in force, even through the Persian, Greek and Parthian conquests, which affected private life in Babylonia very little, and it survived to influence Syro-Roman and later Mahomedan law in Mesopotamia. The law and custom which preceded the Code we shall call "early," that of the New Babylonian empire (as well as the Persian, Greek, &c.) "late." The law in Assyria was derived from that of Babylonia but conserved early features long after they had disappeared elsewhere.

When the Semitic tribes settled in the cities of Babylonia, their tribal custom passed over into city law. The early history of the country is the story of a struggle for supremacy between the cities. A metropolis demanded tribute and military support from its subject cities but left their local cults and customs unaffected. The city rights and usages were respected by kings and conquerors alike.

As late as the accession of Assur-bani-pal and Samas-sum-yukin we find the Babylonians appealing to their city laws that groups of aliens to the number of twenty at a time were free to enter the city, that foreign women once married to Babylonian husbands could not be enslaved and that not even a dog that entered the city could be put to death untried.

The population of Babylonia was of many races from early times and intercommunication between the cities was incessant. Every city had a large number of resident aliens. This freedom of intercourse must have tended to assimilate custom. It was, however, reserved for the genius of Khammurabi to make Babylon his metropolis and weld together his vast empire by a uniform system of law.

Almost all trace of tribal custom has already disappeared from the law of the Code. It is state-law; alike self-help, blood-feud, marriage by capture, are absent; though family solidarity, district responsibility, ordeal, the lex talionis, are primitive features that remain. The king is a benevolent autocrat, easily accessible to all his subjects, both able and willing to protect the weak against the highest-placed oppressor. The royal power, however, can only pardon when private resentment is appeased. The judges are strictly supervised and appeal is allowed. The whole land is covered with feudal holdings, masters of the levy, police, &c. There is a regular postal system. The pax Babylonica is so assured that private individuals do not hesitate to ride in their carriages down to the coast of the Mediterranean. The position of women is free and dignified.

The Code did not merely embody contemporary custom or conserve ancient law. It is true that centuries of law-abiding and litigious habitus had accumulated in the temple archives of each city vast stores of precedent in ancient deeds and the records of judicial decisions, and that intercourse had assimilated city custom. The universal habit of writing and perpetual recourse to written contract even more modified primitive custom and ancient precedent. Provided the parties could agree, the Code left them free to contract as a rule. Their deed of agreement was drawn up in the temple by a notary public, and confirmed by an oath "by god and the king." It was publicly sealed and witnessed by professional witnesses, as well as by collaterally interested parties. The manner in which it was thus executed may have been sufficient security that its stipulations were not impious or illegal. Custom or public opinion doubtless secured that the parties would not agree to wrong. In case of dispute the judges dealt first with the contract. They might not sustain it, but if the parties did not dispute it, they were free to observe it. The judges' decision might, however, be appealed against. Many contracts contain the proviso that in case of future dispute the parties would abide by "the decision of the king." The Code made known, in a vast number of cases, what that decision would be, and many cases of appeal to the king were sent back to the judges with orders to decide in accordance with it. The Code itself was carefully and logically arranged and the order of its sections was conditioned by its subject-matter. Nevertheless the order is not that of modern scientific treatises, and a somewhat different order from both is most convenient for our purpose.

The Code contemplates the whole population as falling into three classes, the amelu, the muskinu and the ordu. The amelu was a patrician, the man of family, whose birth, marriage and death were registered, of ancestral estates and full civil rights. He had aristocratic privileges and responsibilities, the right to exact retaliation for bodily injuries, and liability to heavier fines for crimes. The ordinary citizen might, however, pay his fines to pay. To this class belonged the king and court, the higher officials, the professions and craftsmen. The term became in time a mere courtesy title but originally carried with it standing. Already in the Code, when status is not concerned, it is used to denote "any one." There was no property qualification nor does the term appear to be racial. It is most difficult to characterize the muskinu exactly. The term came in time to mean "a beggar" and with that meaning has passed through Aramaic and Hebrew into many modern languages; but though the Code does not regard him as necessarily poor, he may have been landless. He was free, but had to accept monetary compensation for corporal injuries, paid smaller fees and fines, even paid less offerings to the gods. He inhabited a separate quarter of the city. There is no reason to regard him as specially connected with the court, as a royal pensioner, nor as forming the bulk of the population. The rarity of any reference to him in contemporary documents makes further specification conjectural. The ordu was a slave, his master's chattel, and formed a very numerous class. He could acquire property and even hold other slaves. His master clothed and fed him, paid his doctor's fees, but took all compensation paid for injury done to him. His master usually found him a slave-girl as wife (the children were then born slaves), often set him up in a house (with farm or business) and simply took an annual rent of him. Otherwise he might marry a freewoman (the children were then free), who might bring him a dower which his master could not touch, and at his death one-half of his property passed to his master as his heir. He could acquire his freedom by purchase from his master, or might be freed and dedicated to a temple, or even adopted, when he became an amelu and not a muskinu. Slaves were recruited by purchase abroad, from captives taken in war and by freemen degraded for debt or crime. A slave often ran away; if caught, the captor was bound to restore him to his master, and the Code fixes a reward of two shekels which the owner must pay the captor. It was about one-tenth of the average value. To detain, harbor, &c., a slave was punished by death. So was an attempt to get him to leave the city. A slave bore an identification mark, which could only be removed by a surgical operation and which later consisted of his owner's name tattooed or branded on the arm. On the great estates in Assyria and its subject provinces were many serfs, mostly of subject race, settled captives, or quondam slaves, tied to the soil they cultivated and sold with the estate but capable of possessing land and property of their own. There is little trace of serfs in Babylonia, unless the muskinu be really a serf.

The god of a city was originally owner of its land, which encircled it with an inner ring of irrigable arable land and an outer fringe of pasture, and the citizens were his tenants. The god and his viceroy, the king, had long ceased to disturb tenancy, and were content with fixed dues in naturae, stock,
money or service. One of the earliest monuments records
the purchase by a king of a large estate for his son, paying a
fair market price and adding a handsome honorarium to the
many owners in costly garments, plate, and precious articles of
furniture. The Code recognizes complete private ownership in
land, but apparently extends the right to hold land to vassals,
merchants (and resident aliens?). But all land was sold subject
to its fixed charges. The king, however, could free land from
these charges by charter, which was a frequent way of rewarding
those who deserved well of the state. It is from these charters
that we learn nearly all we know of the obligations that lay
upon land. The state demanded men for the army and the
corvée as well as dues in kind. A definite area was bound to
find a bowman together with his linked pikeman (who bore the
shield for both) and to furnish them with supplies for the cam-
paign. This area was termed "a bow" as early as the 8th
century b.c., but the usage was much earlier. Later, a horseman
was due from certain areas. A man was only bound to serve
so many (six?) times, but the land had to find a man annually.
The service was usually discharged by slaves and serfs, but the
awītu (and perhaps the maššātu) went to war. The bowman
would go, sometimes accompanied by a slave (or was taken
to war). The letters of Hammurabi often deal with claims to exemption.
Religious officials and shepherds in charge of flocks were exempt.
Special liabilities lay upon riparian owners to repair canals,
bridges, quays, &c. The state claimed certain proportions of
all crops, stock, &c. The king's messengers could commander
any subject's property, giving a receipt. Further, every city
had its own octroi duties, customs, ferry dues, highway and
water rates. The king had long ceased to be, if he ever was,
owner of the land. He had his own royal estates, his private
property and dues from all his subjects. The higher officials
had endowments and official residences. The Code regulates
the feudal position of certain classes. They held an estate from
the king consisting of house, garden, field, stock and a salary,
on condition of personal service on the king's errand. They
could not delegate the service on pain of death. When ordered
abroad they could nominate a son, if capable, to hold the benedict
and carry on the duty. If there was no son capable, the state
put in a locum tenens, but granted one-third to the wife to main-
tain herself and children. The benefice was inalienable, could
not be sold, pledged, exchanged, sublet, devised or diminished.
Other land was held of the state for rent. Ancestral estate was
strictly tied to the family. If a holder would sell, the family
had the right of redemption and there seems to have been no
time-limit to its exercise.

The temple occupied a most important position. It received
from its estates, from tithes and other fixed dues, as well as from
the sacrifices (a customary share) and other offerings of the
faithful, vast amounts of all sorts of naturalia; besides money
and permanent gifts. The larger temples had many officials
and servants. Originally, perhaps, each town clustered round
one temple, and each head of a family had a right to minister
there and share its receipts. As the city grew, the right to so
many days a year at one or other shrine (or its "gate") descended
in certain families and became a species of property which could
be pledged, rented or shared within the family, but not alienated.
In spite of all these demands, however, the temples became great
granaries and store-houses; as they also were the city archives.
The temple had its responsibilities. If a citizen was captured by
the enemy and could not ransom himself the temple of his city
did so. To the temple came the poor farmer to borrow
seed corn or supplies for harvesters, &c.—advances which he
repaid without interest. The king's power over the temple was
not proprietary but administrative. He might borrow from it
but repay like other borrowers. The tithe seems to have been
the composition for the rent due to the god for his land. It is
not clear that all lands paid tithe, perhaps only such as once
had a special connexion with the temple.

The Code deals with a class of persons devoted to the service
of a god, as vassals or hierodules. The vassals were vowed to
chastity, lived together in a great nunnery, were forbidden to
open or enter a tavern, and together with other vassals had
many privileges.

The Code recognizes many ways of disposing of property—sale,
lease, barter, gift, dedication, deposit, loan, pledge, all of which
were matters of contract. Sale was the delivery of the purchase
(in the case of real estate symbolized by a staff, a key, or deed
of conveyance) in return for the purchase money, receipts being
given for both. Credit, if given, was treated as a debt, and
secured as a loan by the seller to be repaid by the buyer, for which
he gave a bond. The Code admits no claim unsubstantiated
by documents or the oath of witnesses. A buyer had to convince
himself of the seller's title. If he bought (or received on deposit)
from a minor or a slave without power of attorney, he would be
executed as a thief. If the goods were stolen and the rightful
owner reclaimed them, he had to prove his purchase by producing
the seller and the deed of sale or witnesses to it. Otherwise
he would be adjudged a thief and die. If he proved his purchase,
he had to give up the property but had his remedy against the
seller or, if he had died, could claim five-fold from his estate.
A man who bought a slave abroad, might find that he had been
stolen or captured from Babylonia, and he had to restore him
to his former owner without profit, if he bought property
during a war belonging to a feudal holding, or to a ward in chancery,
he had to return it and forfeit what he gave for it as well. He could
repudiate the purchase of a slave attacked by the hēnu sickness
within the month (later, a hundred days), and had a female slave
due three days on approval. A defect of title or undisclosed liability
would invalidate the sale at any time.

Landowners frequently cultivated their land themselves but
might employ a husbandman or let it. The husbandman
was bound to carry out the proper cultivation, raise an average
crop and leave the field in good tillth. In case the crop failed
the Code fixed a statutory return. Land might be let at a fixed
rent when the Code enacted that accidental loss fell on the tenant.
If let on share-profit, the landlord and tenant shared the loss
proportionately to their stipulated share of profit. If the tenant
paid his rent and left the land in good tillth, the landlord could
interfere nor forbid subletting. Waste land was let to reclaim,
the tenant being rent-free for three years and paying a stipulated
rent in the fourth year. If the tenant neglected to reclaim the
land the Code enacted that he must give it over in good tillth
and fixed a statutory rent. Gardens or plantations were let in
the same ways and under the same conditions; but for date-
groves four years' free tenure was allowed. The metayer system
was in vogue, especially on temple lands. The landlord found
land, labour, oxen for ploughing and working the watering-
machines, carting, threshing or other implements, seed corn,
rations for the workmen and fodder for the cattle. The tenant,
or steward, usually had other land of his own. If he stole the
seed, rations or fodder, the Code enacted that his fingers should
be cut off. If he appropriated or sold the implements, im-
poverished or sublet the cattle, he was heavily fined and in
default of payment might be condemned to be torn to pieces
by the cattle on the field. Rent was as contracted.

Irrigation was indispensable. If the irrigator neglected to
repair his dyke, or let his tunnel open and caused a flood, he
had to make good the damage done to his neighbours' crops, or
be sold for slaves in payment of the cost. The theft of a watering-
machine, water-bucket or other agricultural implements was
heavily fined.

Houses were let usually for the year, but also for longer terms,
rent being paid in advance, half-yearly. The contract generally
specified that the house was in good repair, and the tenant
was bound to keep it so. The woodwork, including doors and door
frames, was removable; and the tenant might bring and take away
his own. The Code enacted that if the landlord would re-enter
before the term was up, he must remit a fair proportion of the rent.
Land was leased for houses or other buildings to be built upon it,
the tenant being rent-free for eight or ten years; after which
the building came into the landlord's possession.

Despite the multitude of slaves, hired labour was often needed,
especially at harvest. This was matter of contract, and the hire,
who usually paid in advance, might demand a guarantee to fulfill the engagement. Cattle were hired for ploughing, working the watering-machines, carting, threshing, etc. The Code fixed a statutory wage for soucers, ox-drivers, field-labourers, and lurer for oxen, asses, &c.

There were many herds and flocks. The flocks were committed to a shepherd who gave receipt for them and took them out to pasture. The Code fixed him a wage. He was responsible for all care, must restore ox for ox, sheep for sheep, must breed them satisfactorily. Any dishonest use of the flock had to be repaid ten-fold, but loss by disease or wild beasts fell on the owner. The shepherd made good all loss due to his neglect. If he let the flock feed on a field of corn he had to pay damages four-fold; if he turned them into standing corn when they ought to have been folded he paid twelve-fold.

In commercial matters, payment in kind was still common, though the contracts usually stipulate for cash, naming the standard expected, that of Babylon, Larsa, Assyria, Carchemish, &c. The Code enacted, however, that a debtor must be allowed to pay in produce according to statutory scale. If a debtor had neither money nor crop, the creditor must not refuse goods.

A debt secured on the person of the debtor. Distraint on a debtor was forbidden by the Code; not only must the creditor give it back, but his illegal action forfeited his claim altogether. An unsanctioned seizure for debt was fined, as was the distraint of a working ox. The debtor being seized for debt could nominate as mancipium or hostage to work off the debt, his wife, a child, or slave. The creditor could only hold a wife or child three years as mancipium. If the mancipium died a natural death while in the creditor’s possession no claim could lie against the latter; but if he was the cause of death by cruelty, he had to give son for son, or pay for a slave. He could sell a slave-hostage, unless she were a slave-girl who had borne her master children. She had to be redeemed by her owner.

The debtor could also pledge his property, and in contracts often pledged a field, house or crop. The Code enacted, however, that the debtor should always take the crop himself and pay the creditor from it. If the crop failed, payment was deferred and no interest could be charged for that year. If the debtor did not cultivate the field himself he had to pay for the cultivation, but if the cultivation was already finished he must harvest it himself and pay his debt from the crop. If the cultivator did not get a crop this would not cancel his contract. Pledges were often made where the intrinsic value of the article was equivalent to the amount of the debt; but antichretic pledge was more common, where the profit of the pledge was a set-off against the interest of the debt. The whole property of the debtor might be pledged as security for the payment of the debt, without any of it coming into the enjoyment of the creditor. Personal guarantees were often given that the debtor would repay or the guarantor become liable himself.

Trade was very extensive. A common way of doing business was for a merchant to entrust goods or money to a travelling agent, who sought a market for his goods. The caravans travelled far beyond the limits of the empire. The Code insisted that the agent should inventory and give a receipt for all that he received. No claim could be made for anything not so entered. Even if the agent made no profit he was bound to return double what he had received, if he made poor profit he had to make up the deficiency; but he was not responsible for loss by robbery or extortion on his travels. On his return, the principal must give a receipt for what was handed over to him. Any false entry or claim on the agent’s part was penalised three-fold, on the principal’s part six-fold. In normal cases profits were divided according to contract, usually equally.

A considerable amount of forwarding was done by the caravans. The carrier gave a receipt for the consignment, took all responsibility and exacted a receipt on delivery. If he defrauded he paid five-fold. He was usually paid in advance. Deposit, especially warehousing of grain, was charged for at one-sixtieth. The warehouseman took all risks, paid double for all shortage, but no claim could be made unless he had given a properly witnessed receipt. Water traffic on the Euphrates and canals was early very considerable. Ships, whose tonnage was estimated at the amount of grain they could carry, were continually hired for the transport of all kinds of goods. The Code fixes the price for building and insists on the builder’s giving a year’s guarantee of seaworthiness. It fixes the hire of ship and crew. The captain was responsible for the freight and the ship; he had to replace all loss. Even if he refloated the ship he had to pay a fine of half its value for sinking it. In the case of collision the boat under way was responsible for damages to the boat at anchor. The Code also regulated the liquor traffic, fixing a fair price for beer and forbidding the connivance of the tavern-keeper (a female) at disorderly conduct or treasonable assembly, under pain of death. She was to have the offenders to the palace, which implied an efficient and accessible police system.

Payment through a banker or by written draft against deposit was frequent. Bonds to pay were treated as negotiable. Interest was rarely charged on advances by the temple or wealthy landowners for pressing needs, but this may have been part of the money system. The borrowers may have been tenants. Interest was charged at a higher rate for overdue loans of this kind. Merchants (and even temples in some cases) made ordinary business loans, charging from 20 to 30%.

Marriage retained the form of purchase, but was essentially a contract to be man and wife together. The marriage of young people was usually arranged between the relatives, the bridegroom’s father providing the bride-price, which with other presents the suitor ceremonially presented to the bride’s father. This bride-price was usually handed over by her father to the bride on her marriage, and so came back into the bridegroom’s possession, along with her dowry, which was her portion as a daughter. The bride-price varied much, according to the position of the parties, but was in excess of that paid for a slave. The Code enacted that if the father does not, after accepting a man’s presents, give him his daughter, he must return the presents doubled. Even if his decision was brought about by libel on the part of the suitor’s friend this was done, and the Code enacted that the faithless friend should not marry the girl. If a suitor changed his mind, he forfeited the presents. The dowry might include real estate, but generally consisted of personal effects and household furniture. It remained the wife’s for life, descending to her children, if any; otherwise returning to her family, when the husband could deduct the bride-price if it had not been given to her, or return it, if it had. The marriage ceremony included joining of hands and the utterance of some formula of acceptance on the part of the bridegroom, as “I am the son of nobles, silver and gold shall fill thy lap, thou shalt be my wife, I will be thy husband. Like the fruit of a garden I will give thee offspring.” It must be performed by a freeman.

The marriage contract, without which the Code ruled that the woman was no wife, usually stated the consequences to which each party was liable for repudiating the other. These by no means necessarily agree with the Code. Many conditions might be inserted: as that the wife should act as maidervant to her mother-in-law, or to a first wife. The married couple formed a unit in external responsibility for all debts. The man responsible for debts contracted by his wife, even before her marriage, as well as for his own; but he could use her as a mancipium. Hence the Code allowed a proviso to be inserted in the marriage contract, that the wife should not be seized for her husband’s pre-nuptial debts; but enacted that then he was not responsible for her pre-nuptial debts, and, in any case, that both together were responsible for all debts contracted after marriage.

A man might make his wife a settlement by deed of gift, which gave her a life interest in part of his property, and he might reserve to her the right to bequeath it to a favourite child, but she could in no case leave it to her family. Although married she always remained a member of her father’s house—she is rarely named wife of A, usually daughter of B, or mother of C.

Divorce was optional with the man, but he had to restore the dowry and, if the wife had borne him children, she had the
BABYLONIAN LAW

custody of them. He had then to assign her the income of field, or garden, as well as goods, to maintain herself and children until they grew up. She then shared equally with them in the allowance (and apparently in his estate at his death) and was free to marry again. If she had no children, he returned her the dowry and paid her a sum equivalent to the bride-price, or a mina of silver, if there had been none. The latter is the forfeit usually named in the contract for his repudiation of her.

If she had been a bad wife, the Code allowed him to send her away, while he kept the children and her dowry; or he could degrade her to the position of a slave in his own house, where she would have food and clothing. She might bring an action against him for cruelty and neglect and, if she proved her case, obtain a judicial separation, taking with her dowry. No other punishment fell on the man. If she did not prove her case, but was proved to be a bad wife, she was drowned. If she were left without maintenance during her husband's involuntary absence, she could cohabit with another man, but must return to her husband if he came back, the children of the second union remaining with their own father. If she had maintenance, a breach of the marriage tie was adultery. Willful desertion by, or exile of, the husband dissolved the marriage, and if he came back he had no claim on her property; possibly not on his own.

As a widow, the wife took her husband's place in the family, living on in his house and bringing up the children. She could only remarry with judicial consent, when the judge was bound to inventory the deceased's estate and hand it over to her and her new husband in trust for the children. They could not alienate a single utensil. If she did not remarry, she lived on in her husband's house and took a child's share on the division of his estate, when the children had grown up. She still retained her dowry and any settlement decreed to her by her husband. This property came to her children. If she had remarried, all her children shared equally in her dowry, but the first husband's gift fell to his children or to her selection among them, if so empowered.

Monogamy was the rule, and a childless wife might give her husband a maid (who was no wife) to bear him children, who were reckoned hers. She remained mistress of her maid and might degrade her to slavery again for insolence, but could not sell her if she had borne her husband children. If the wife did this, the Code did not allow the husband to take a concubine. If she would not, he could do so. The concubine was a wife, though not of the same rank; the first wife had a free wife, and the second woman, was often dowered for marriage and her children were legitimate. She could only be divorced on the same conditions as a wife. If a wife became a chronic invalid, the husband was bound to maintain her in the home they had made together, unless she preferred to take her dowry and go back to her father's house; but he was free to remarry. In all these cases the children were legitimate and legal heirs.

There was, of course, no hindrance to a man having children by a slave girl. These children were free, in any case, and their mother could not be sold, though she might be pledged, and she was free on her master's death. These children could be legitimized by their father's acknowledgment before witnesses, and were often adopted. They then ranked equally in sharing their father's estate, but if not adopted, the wife's children divided and took first choice.

Vestal virgins were not supposed to have children, yet they could and often did marry. The Code contemplated that such a wife would give a husband a maid as above. Free women might marry slaves and be dowered for the marriage. The children were free, and at the slave's death the wife took her dowry and half what she and her husband had acquired in wedlock for self and children; the master taking the other half as his slave's heir.

A father had control over his children till their marriage. He had a right to their labour in return for their keep. He might hire them out and receive their wages, pledge them for debt, even sell them outright. Mothers had the same rights in the absence of the father; even elder brothers when both parents were dead.

A father had no claim on his married children for support, but they retained a right to inherit on his death.

The daughter was not only in her father's power to be given in marriage, but she might dedicate her to the service of some god as a vestal or a hierodule; or give her as a concubine. She had no choice in these matters, which were often decided in her childhood. A grown-up daughter might wish to become a votary, perhaps in preference to an uncongenial marriage, and it seems that her father could not refuse her wish. In all these cases the father might dower her. If he did not, on his death the brothers were bound to do so, giving her a full child's share if a wife, a concubine or a vestal, but one-third of a child's share if she were a hierodule or a Marduk priestess. The latter had the privilege of exemption from state dues and absolute disposal of her property. All other daughters had only a life interest in their dowry, which reverted to their family, if childless, or went to their children if they had any. A father might, however, execute a deed granting a daughter power to leave her property to a favourite brother or sister. A daughter's estate was usually managed for her by her brothers, but if they did not satisfy her, she could appoint a steward. If she married, her husband managed it.

The son also appears to have received his share on marriage, but do not always leave his father's house; he might bring his wife there. This was usual in child marriage.

Adoption was very common, especially where the father (or mother) was childless or had seen all his children grow up and marry away. The child was then adopted to care for the parents' old age. This was done by contract, which usually specified what the parent had to leave and what maintenance was expected. The real children, if any, were usually consenting parties to an arrangement which cut off their expectations. They even, in some cases, found the estate for the adopted child who was to relieve them of a care. If the adopted child failed to carry out the filial duty the contract was annulled in the law courts. Slaves were often adopted and if they proved unfaithful were reduced to slavery again.

A craftsman often adopted a son to learn the craft. He profited by the son's labour. If he failed to teach his son the craft, that son could prosecute him and get the contract annulled. This was a form of apprenticeship, and it is not clear that the apprentice had any filial relation.

A man who adopted a son, and afterwards married and had a family of his own, could dissolve the contract but must give the adopted child one-third of a child's share in goods but real estate; that could only descend in the family to which he had ceased to belong. Vestals frequently adopted daughters, usually other vestals, to care for their old age.

Adoption had to be with consent of the real parents, who usually executed a deed making over the child, who thus ceased to have any claim upon them. But vestals, hierodules, certain palace officials and slaves had no rights over their children and could raise no obstacle. Foundlings and illegitimate children had no parents to object. If the adopted child discovered his true parents and wanted to return to them, his eye or tongue was torn out. An adopted child was a full heir, the contract might even assign him the position of eldest son. Usually he was residuary legatee.

All legitimate children shared equally in the father's estate at his death, reservation being made of a bride-price for an unmarried son, dower for a daughter or property deeded to favourite children by the father. There was no birthright attaching to the position of eldest son, but he usually acted as executor and after considering what each had already received equalized the shares. He even made grants in excess to the others from his own share. When there were two or more, the two families shared but usually in the father's estate until later times when the first family took two-thirds. Daughters, in the absence of sons, had sons' rights. Children also shared their own mother's property, but had no share in that of a stepmother.

A father could disinherit a son in early times without restriction, but the Code insisted upon judicial consent and that only for repeated unfaithful conduct. In early times the son who denied his father had his front hair shorn, a slave-mark put on him, and
could be sold as a slave; while if he denied his mother he had his front hair shorn, was driven round the city as an example and expelled his home, but not degraded to slavery.

Adultery was punished with the death of both parties by drowning, but if the husband was willing to pardon his wife, the king might intervene to pardon the paramour. For incest with his own mother, both were burned to death; with a stepmother, the man was dismembered; with a daughter, the man was exiled; with a daughter-in-law, he was drowned; with a son's betrothed, he was fined. A wife who for her lover's sake procured her husband's death was gibbeted. A betrothed girl, seduced by her prospective father-in-law, took her dowry and returned to her family, and was free to marry as she chose.

In the criminal law the ruling principle was the lex talionis. Eye for eye, tooth for tooth, limb for limb was the penalty for assault upon an amelus. A sort of symbolic retaliation was the punishment of the offending member, seen in the cutting off the hand that struck a father or stole a trust; in cutting off the breast of a wet-nurse who substituted a changeling for the child entrusted to her; in the loss of the tongue that denied father or mother (in the Elamite contracts the same penalty was inflicted for perjury); in the loss of the eye that pried into forbidden secrets. The loss of the surgeon's hand that caused loss of life or limb; or the brander's hand that obliterated a slave's identification mark, are very similar. The slave, who struck a freeman or denied his master, lost an ear, the organ of hearing and symbol of obedience. To bring another into danger of death by false accusation was punished by death. To cause loss of liberty or property by false witness was punished by the penalty the perjurer sought to bring upon another.

The death penalty was freely awarded for theft and other crimes regarded as coming under that head; for theft involving entrance of palace or temple treasury, for illegal purchase from minor or slave, for selling stolen goods or receiving the same, for common theft in the open (in default of multiple restoration) or receiving the same, for false claim to goods, for kidnapping, for assisting or harbouring fugitive slaves, for delaying or appropriating same, for brigandage, for fraudulent sale of drink, for disorderly conduct of tavern, for delegation of personal service, for misappropriating the levy, for oppression of feudal holders, for causing death of a householder by bad building. The manner of death is not specified in these cases. This death penalty was also fixed for such conduct as placed another in danger of death. A specified form of death penalty occurs in the following cases:—gibbeting (on the spot where crime was committed) for burglary, later also for encroaching on the king's highway, for getting a slave-brand obliterated, for procuring husband's death; burning for incest with own mother, for vestal entering or opening tavern, for theft at fire (on the spot); drowning for adultery, rape of betrothed maiden, bigamy, bad conduct as wife, seduction of daughter-in-law.

A curious extension of the talio is the death of creditor's son for his father's having caused the death of debtor's son as mancipium; of builder's son for his father's causing the death of house-owner's son by building the house badly; the death of a man's daughter because her father caused the death of another man's son by his house.

The contracts naturally do not concern such criminal cases as the above, as a rule, but marriage contracts do specify death by stranguing, drowning, precipitation from a tower or pinnacle of the temple or by the iron sword for a wife's repudiation of her husband. We are quite without evidence as to the executive in all these cases.

Exile was inflicted for incest with a daughter; disinheritance for incest with a stepmother or for repeated unfilial conduct. Sixty strokes of an ox-hide scourge were awarded for a brutal assault on a superior, both being amelus. Branding (perhaps the equivalent of degradation to slavery) was the penalty for slander of a married woman or vestal. Deprivation of office in perpetuity fell upon the corrupt judge. Enslavement befell the extravagant wife and unlawful children. Imprisonment was common, but is not recognized by the Code.

The commonest of all penalties was a fine. This is awarded by the Code for corporal injuries to a manushu or slave (paid to his master); for damages done to property, for breach of contract; The restoration of goods appropriated, illegally bought, or damaged by neglect, was usually accompanied by a fine, giving it the form of multiple restoration. This might be double, triple, fourfold, fivefold, sixfold, tenfold, twelvefold, even thirtyfold, according to the enormity of the offence.

The Code recognized the importance of intention. A man who killed another in a quarrel must swear he did not do so intentionally, and was then only fined according to the rank of the deceased. The Code does not say what would be the penalty of murder, but death is so often awarded where death is caused that we can hardly doubt that the murderer was put to death. If the assault only led to injury and was unintentional, the assaulter in a quarrel had to pay the doctor's fees. A brander, induced to remove a slave's identification mark, could swear to his ignorance and was free. The owner of an ox which gored a man on the street was only responsible for damages if the ox was known by him to be vicious, even if it caused death. If the man expired the fine for the death of the ox was doubled. If the creditor's house-brand was lost, it had to be replaced at the creditor's expense and the brander was fined.

In ordinary cases responsibility was not demanded for accident or for more than proper care. Poverty excused bigamy on the part of a deserted wife.

On the other hand, carelessness and neglect were severely punished, as in the case of the unskilful physician, if it led to loss of life or limb his hands were cut off, a slave had to be replaced, the loss of his eye paid for to half his value; a veterinary surgeon who caused the death of an ox or ass paid quarter value; a builder, whose careless workmanship caused death, lost his life or paid for it by the death of his child, replaced slave or goods, and in any case had to rebuild the house or make good any damages due to defective building and repair the defect as well. The boat-builder had to make good any defect of construction or damage due to it for a year's warranty.

Throughout the Code respect is paid to status.

Suspicion was not enough. The criminal must be taken in the act, e.g. the adulterer, ravisher, &c. A man could not be convicted of theft unless the goods were found in his possession.

In the case of a lawsuit the plaintiff preferred his own plea. There is no trace of professional advocates, but the plea had to be in writing and the notary doubtless assisted in the drafting of it. The judge saw the plea, called the other parties before him and sent for the witnesses. If these were not at hand he might adjourn the case for their production, specifying a time up to six months. Guarantees might be entered into to produce the witnesses on a fixed day. The more important cases, especially those involving life and death, were tried by a bench of judges. With the judges were associated a body of elders, who shared in the decision, but whose exact function is not yet clear. Agreements, declarations and non-contestant cases are usually witnessed by one judge and twelve elders.

Parties and witnesses were put on oath. The penalty for false witness was usually that which would have been awarded the convicted criminal. In matters beyond the knowledge of men, as the guilt or innocence of an alleged wizard or a suspected wife, the ordeal by water was used. The accused jumped into the sacred river, and the innocent swam while the guilty drowned. The accused could clear himself by oath where his own knowledge was alone available. The plaintiff could swear to his loss by brigands, as to goods claimed, the price paid for a slave purchased abroad or the sum due to him. But great stress was laid on the production of written evidence. It was a serious thing to lose a document. The judges might be satisfied of its existence and terms by the evidence of the witnesses to it, and then issue an order that whenever found it should be given up.

Contracts annulled were ordered to be broken. The court might give a journey to view the property and even take with them the sacred symbols on which oath was made.

The decision given was embodied in writing, sealed and witnessed by the judges, the elders, witnesses and a scribe. Women might act in all these capacities. The parties swore an oath.
oath, embodied in the document, to observe its stipulations. Each took a copy and one was held by the scribe to be stored in the archives.

Appeal to the king was allowed and is well attested. The judges at Babylon seem to have formed a superior court to those of provincial towns, but a defendant might elect to answer the charge before the local court and refuse to plead at Babylon.

Finally, it may be noted that many immoral acts, such as the use of false weights, lying, &c., which could not be brought into court, are severely denounced in the Omen Tablets as likely to bring the offender into "the hand of God" as opposed to "the hand of the king."

BACAU, the capital of the department of Bacau, Rumania; situated among the foothills of the Carpathian Mountains, and on the river Bistrita, which enters the river Sereth 5 m. S. Pop. (1890) 15,187, including 7,850 Jews. Although of modern growth, Bacau is one of the chief commercial centres in Moldavia, possessing many large timber yards. It is on the main railway from Czernowitz, in Bukovina, to Galatz; and on two branch lines, one of which enters Transylvania through the Ghimes Pass, while both give access to the salt mines, petroleum wells and forests of the Carpathians.

BACCHAR, a gambling card-game (origin of name unknown), supposed to have been introduced into France from Italy during the reign of Charles VIII. There are two accepted varieties of the game—bacchar chemin de fer (railway) and bacchar banque (or à deux tableaux). In bacchar chemin de fer six full packs of cards are used. These are shuffled by a croupier and then by any of the players who wish to do so. From three to eleven persons may play. Counters are generally used and are sold by the banker who afterwards redeems them. The croupier takes a number of cards from the top of the pack and passes them to the player on his right (sometimes left) who becomes banker, a position which he holds until he loses, when the deal passes to the player next in order. The banker is called a "punter." The banker places before him the sum he wishes to stake and the punters do likewise, unless a punter desires to go bank, signifying his intention by saying, Banco! In this case he plays against the entire stake of the banker. After the stakes have been made the dealer deals a card to his right for the punters, then one to himself, then a third to his left for the punters and, finally, another to himself, all face downward. A Court card, and ten count nothing; all others the number of the play. Each punter looks at his cards, and any one having 8 or 9 turns his card up and announces it, the hand then being at an end. The player having the highest stake plays for both punters, and if the card turned is better than that of the banker, the latter pays each punter the amount of his stake. If not, the banker wins all stakes and the game proceeds as before. If no announcement is made, meaning that neither player holds 8 or 9, the banker deals another card to the player on his right, who, if his first card is 6 or 7, will refuse it, fearing to overrun. The second card is turned face upwards on the table. If his card is 5 he may, or may not, accept the second card, according to his judgment. In case of his refusal the card is offered to the second punter. If the first card is baccarat (i.e., amounts to 0) or 2, 3, or 4, a punter always accepts the second card. The banker then decides whether he will draw another card himself or expose his original ones, and when he has made his play pays or receives according as he wins or loses. Ties neither win nor lose but go over to the next deal. A player who has lost on going bank may go bank again, but no player may go bank more than twice in succession. In the variation baccarat banque (or à deux tableaux), three packs of cards are used and the banker is permanent; the player who offers to risk the largest amount occupying the position. A line is drawn across the table and any one wishing to do so may place his stake à cheval, i.e. on the line. Stakes so placed neither win nor lose if one side wins and the other loses, but win if both sides win and are lost if both sides lose. The laws of baccarat are complicated and no one code is accepted as authoritative, the different clubs making their own rules.

See Badoureau, Étude mathématique sur le jeu de baccarat (Paris, 1881); L. Billard, Biographie du baccarat expérimental (Paris, 1883).

BACCHANALIA, the Lat. name for the wild and mystic festivals of Bacchus. They were introduced into Rome from lower Italy by the Etruscans, and held in secret, attended by women only, on three days in the year in the grove of Simila (Stimula, Semele; Ovid, Fasti, vi. 593), near the Aventine hill. Subsequently, admission to the rites were extended to men and celebrations took place five times a month. The evil reputation of these festivals, at which the grossest debaucheries took place, and all kinds of crimes and political conspiracies were supposed to be planned, led in 186 B.C. to a decree of the senate—the so-called Senatus consultum de Bacchanalibus, inscribed on a bronze tablet discovered in Calabria (1640), now at Vienna—by which the Bacchanalia were prohibited throughout the whole of Italy, except in certain special cases, in which the senate reserved the right of allowing them, subject to certain restrictions. But, in spite of the severe punishment inflicted upon those who were found to be implicated in the criminal practices disclosed by state investigation, the Bacchanalia were not stamped out, at any rate in the south of Italy, for a very long time (Livy xxxix. 8–10; xi. 19).

BACCHYLIDES, Greek lyric poet, was born at Iulis, in the island of Corinth, in the family of Darius, a rich landowner; Meiron, his mother was a sister of Simonides, himself a native of Iulis. Eusebius says that Bacchylides "flourished" (ἐκμεταλείποντο) in Ol. 78. 2 (467 B.C.). As the ἐκμεταλεῖσθαι refers to the physical prime, and was commonly placed at about the fortieth year, we may suppose that Bacchylides was born circa 507 B.C. Among his Odes the earliest that can be approximately dated is xii.1 which may belong to 481 or 470 B.C.; the latest is vi., of which the date is fixed by the recently found fragment of the Olympic register to Ol. 82. 1 (452 B.C.). He would thus have been some forty-nine years younger than his uncle Simonides, and some fifteen years younger than Pindar. Elsewhere Eusebius states that Bacchylides "was of repute" (ἐρωτασθηκὼς) in Ol. 87. 2 (431 B.C.); and Georgius Syncellus, using the same word, gives Ol. 88 (428–425 B.C.). The phrase would mean that he was then in the fullness of years and of fame. There is nothing improbable in the supposition that he survived the beginning of the Peloponnesian war.

Bacchylides, like Simonides and Pindar, visited the court of Hiero I of Syracuse (478–467). In his fifth Ode (476 B.C.), the word ἔκπληξις (v. 11) has been taken to mean that he had already been the guest of the prince; and, as Simonides went to Sicily in or about 477 B.C., that is not unlikely. Ode iii. (468 B.C.) was possibly written at Syracuse, as verses 15 and 16 suggest. He there pays a high compliment to Hiero's taste in poetry (ver. 3 ff.). A scholiion on Pith. ii. 90 (166) avers that Hiero preferred the Odes of Bacchylides to those of Pindar. The Alexandrian scholars interpreted a number of passages in Pindar as hostile allusions to Bacchylides or Simonides. If the scholiasts

1 The references are given according to the numbering in Jabb's edition.
are right, it would appear that Pindar regarded the younger of the two Cean poets as a jealous rival, who disparaged him to their common patron (schol. Pyth. ii. 58 f.), and as one whose poetic skill was due to study rather than to genius (Ol. ii. 97-110). In Olym. ii. 96 the dual γαρδερον, if it does not refer to the uncle and nephew, remains mysterious; nor does it admit of probable emendation.1 One would gladly reject this tradition, to which the scholia so frequently refer; yet it would be rash to assume that it rested merely on surmise. The Alexandrians may have possessed evidence on the subject which is now lost. It is tolerably certain that the three poets were visitors at Hiero's court at about the same time: Pindar and Bacchylides wrote odes of the same kind in his honour; and there was a tradition that he preferred the younger poet. There is thus no intrinsic improbability in the hypothesis that Pindar's haughty spirit had suffered, or imagined, some mortification. It is noteworthy that, whereas in 476 and 470 both he and Bacchylides celebrated Hiero's victories, in 468 (the most important occasion of all) Bacchylides alone was commissioned to do so; although in that year Pindar composed an ode (Olym. vi.) for another Syracusean victor at the same festival. Nor is it difficult to conceive that a despot such as Hiero who was in such exalted position was ill disposed to one who was perhaps all the more exigent of deference on that account, may have found the genial Ionian a more agreeable courtier than Pindar, an aristocrat of the Boeotio-Aeolic type, not unmindful of this fathers the Aegidiae, and rather prone to link the praises of his patron with a lofty intimation of his own claims (see, e.g., Olym. i. ad fin.). But, whatever may have been the true bearing of Pindar's occasional innuendoes, it is at any rate pleasant to find that in the extant work of Bacchylides there is no the faintest semblance of hostile allusion to any rival. Nay, one might almost imagine a compliment to Pindar, when, in mentioning Hesiod, he calls him Βακχιλίδης ἄνεπος.

Plutarch (de Exilio, p. 605 c) names Bacchylides in a list of writers, who after they had been banished from their native cities, were active and successful in literature. It was Peloponnesus that afforded a new home to the exiled poet. The passage gives no clue to date or circumstance; but it implies that Peloponnesus was the region where the poet's genius ripened and where he did his work. His new situation was ill adapted to a residence of considerable length; and it may be noted that some of the poems illustrate their author's intimate knowledge of Peloponnesus. Thus in Ode viii., for Automedon of Phlius, he draws on the legends connected with the Phlian island Asopus. In Ode x., starting from the Argive legend of Proetus and Acrisius, he tells how the Arcadian cult of Artemis Ηιμεκα was founded. In one of his dithyrambs (xix.) he treated the legend of Idas (a Messenian hero) and Melpomene in the form of a hymeneus sung by maidens of Sparta.

The Alexandrian scholars, who drew up select lists of the best writers in each kind, included Bacchylides in their "canon" of the nine lyric poets, along with Alcman, Sappho, Alcaeus, Stesichorus, Ibycus, Anacreon, Simonides and Pindar. The Alexandrian grammatarion Dimydes (cirt. 30 n.c.) wrote a commentary on the epinikious odes of Bacchylides. Horace, a poet in some respects of kindred genius, was a student of his works, and imitated him (according to Porphyry) in Od. i. 57, where Nereus predicts the destruction of Troy. Quotations from Bacchylides, or references to him, occur in the poetry of Hesiod, Simonides, the Hymn to Pan, Plutarch, Stobaeus, Athenaeus, Aulus Gellius, Zenobius, Hephæstion, Clement of Alexandria, and various grammarians or scholars. Ammianus Marcellinus (xxv. 4) says that the emperor Julian enjoyed reading Bacchylides. It is clear, then, that this poet continued to be popular during at least the first four centuries of our era. No inference adverse to his reputation can fairly be drawn from the fact that no mention of him occurs in the extant work of any Attic writer. The only definite estimate of him by an ancient critic occurs in the treatise Περὶ Θύους commonly translated "On the Sublime," but meaning rather, "On the Sources of Elevation in Style," a work ambitiously referred to Cassius Longinus (cirt. a.d. 260), but more probably due to some writer of the first century of our era. In chapter xxxiii. of that treatise, the author asks whether we ought to prefer "greatness" in literature, with some attendant faults, to flawless merit on a lower level, and of course replies in the affirmative. In tragedy, he asks, who would be Ion of Chios rather than Sophocles; or in lyric poetry, Bacchylides rather than Pindar? Yet Bacchylides and Ion are "faultless, with a style of perfect elegance and finish." In short, the essayist regards Bacchylides as a thoroughly finished poet of the second class, who never commits glaring faults, but never reaches the loftier heights.

The first and most general quality of style in Bacchylides is his perfect simplicity and clearness. Where the text is not corrupt, there are few sentences which are not lucid in meaning and simple in structure. This lucidity is partly due, no doubt, to the fact that he seldom attempts imagery of the bolder kind, and never has thoughts of a subtle or complex order. Yet it would be very unjust to regard such clearness as merely a compensatory merit of lyric mediocrity, or to ignore its intimate connexion with the man's native grace of mind, with the artist's habit of finely preserving in the poem's deliberate skill. How many readers, who would enjoy a more difficult, are stopped on the threshold by the aspect of his style, and are faint to save their self-esteem by concluding that he is at once turgid and shallow! A pellucid style must always have been a source of wide, though modest, popularity for Bacchylides. If it be true that Hiero preferred him to Pindar, and that he was a favourite with Julian, those instances suggest the charm which he must always have had for cultivated readers to whom affairs did not leave much leisure for study, and who rejoiced in a poet with whom they could live on such easy terms.

Another prominent trait in the style of Bacchylides is his love of picturesque detail. This characteristic marks the fragment by which, before the discovery of the 1806 MS., he was best known—a passage, from one of his pacans, on the blessings of peace (fr. 13, Bergk. 3, Jebb); and it frequently appears in the Odes, especially in the mythical narratives. Greater poets can make an image flash upon the mind, as Pindar sometimes does, by a magic phrase, or by throwing one or two salient points into strong relief. The Bacchylides is usually quieter; he has no cabinet pictures. Observations and elegies are more for him than grasp or piercing insight; but his work is often of very high excellence in his own kind. His treatment of simile is only a special phase of this general tendency. It is exemplified by the touches with which he elaborates the simile of the eagle in Ode v., and that of the storm-tossed mariners in Ode xii. This full development of simile is Homeric in manner, but not Homeric in motive: Homer's aim is vividness; Bacchylides is rather intent on the decorative value of the details themselves. There are occasional flashes of brilliance in his imagery, when it is lit up by his keen sense of beauty or splendour in external nature. A radiance, "as of fire," streams from the forms of the Nereids (xvi. 103 ff.). An athlete shines out among his fellows like "the bright moon of the mid-month night" among the stars (viii. 27 ff.). The sudden gleam of hope which comes to the Trojans by the withdrawal of Achilles is like a ray of sunshine "from beneath the edge of a storm-cloud" (xii. 105 ff.). The shades of the departed, as seen by Heracles on the banks of the Cocytus, are compared to the countless leaves fluttering in the charging hands of Ida" (v. 65 ff.)—an image not unworthy of Dante or of Milton.

Among the minor features of this poet's style the most remarkable is his use of epithets. A god or goddess nearly always receives some ornamental epithet; sometimes, indeed, two or even three (e.g. καλικοσόφος ευμένης . . . Ἀρτεμίδος λεικοφόλου, v. 98 f.). Such a trait is in unison with the epic manner, the straightforward narrative, which we find in some of the larger poems (as in v., x., and xvi.). On the other hand, the copious use of such ornament has the disadvantage that it sometimes gives a tinge of conventionality to his work. This impression is somewhat strengthened by the fact that many

---

1 For other explanations suggested, see Jebb's edition, Introd. p. 18.
of the epithets are long compound words, not found elsewhere but (in some cases at least) probably invented by the poet; words which suggest a deliberate effort to vary the stock repertoire.

The poems contained in the MS. of Bacchylides found (see below) in 1896 are of two classes: I. Odes of Victory; II. Dithyrambs. The Ode of Victory, ekphrasis (μύος) or μισσος (ποιός), is a form derived from the ποιός, which was properly a song in praise of a deity. Stesichorus (c. 590 B.C.) seems to have been the first who composed hymns in honour, not of gods, but of heroes; the next step was to write hymns in celebration of victories by living men. This custom arose in the second half of the 6th century B.C., the age in which the games at the four great Greek festivals reached the fullness of their popularity. Simonides (b. c. 556 B.C.) was the earliest recorded writer of epinikia. His odes of this class are now represented only by a few very small fragments, some twenty lines in all. Two of these fragments, belonging to the description of a chariot-race, warrant the belief that Simonides, in his epinikia, differed from Pindar in dwelling more on the incidents of the particular victory. The same characteristic is found in the epinikia of Bacchylides. His fifth ode, and Pindar's first Olympian, alike celebrate the victory of the horse Pherenicus; but, while Pindar's reference to the race itself is slight and general (vv. 20-22), Bacchylides describes the running of the winner more vividly and fully (vv. 37-49).

The MS. contains fourteen epinikia, or thirteen if Blass be right in supposing that Bacchylides wrote a fourteenth ode, which is not preserved. The edictio princeps, are parts of a single ode (for Lachon of Cees). Four (or on the view just stated, three) of the odes relate to the Olympic festival: two to the Pythian; three to the Isthmian; three to the Nemean; and one to a Thessalian festival called the Dithyramb of Meleager. The order in which the MS. arranges the other epinikia seems to be casual: at least it does not follow (1) the alphabetical sequence of the victors' names, or of the names of their cities; nor (2) chronological sequence; nor (3) classification by contests; nor (4) classification by festivals—except that the four Great festivals precede the Petreias. The first ode, celebrating a victory of the Cean Argeios at the Isthmus, may possibly have been placed there for a biographical reason, viz., because the poet treated in it the early legends of his native island.

A mythical narrative, connected in some way with the victor or his city, usually occupies the central part of the Pindaric ode. It serves to lift the poem into an ideal region, and to invest it with more than a local or temporary significance. The method of Bacchylides in this department of the epinikia is best illustrated in the case of Chiron ode vii. (the first ode of the MS.), and of the Meleager in ode v., and that of the Proetides in ode x. Pindar's habit is to select certain moments or scenes of a legend, which he depicts with great force and vividness. Bacchylides, on the other hand, has a gentle flow of simple epic narrative; he relies on his interest of the story as a whole, rather than on his power of relating situations. Another element, always present in the longer odes of victory, is that which may be called the "gnomic." Here, again, there is a contrast between the two poets. Pindar packs his γνώμαι, his maxims or moral sentiments, into terse and sometimes obscure epigrams; he utters them in a didactic tone, as of one who can speak with the commanding voice of Delphic wisdom. The moralizing of Bacchylides is rather an utterance of quiet meditation, sometimes recalling the strain of Ionian gnomic elegy.

The epinikia of Bacchylides are followed in the MS. by six compositions which the Alexandrians classed under the general name of διθυράμβοι, and which we, too, must be content to describe collectively as Dithyrambs. The derivation of διθυράμβος is uncertain: α may be the root seen in τίος (ep. Σαββάτου), and τίονας another form of τίονας, a word by which Cratinus (c. 449 B.C.) denotes some kind of hymn to the wine-god. The "dithyramb," first mentioned by Xenophon (c. 670 B.C.), received a finished and choral form from Arion of Lesbos (c. 600 B.C.). His dithyrambs, produced at Corinth, belonged to the cult of Dionysus, and the members of his chorus (πραγκός χορός) personated satyrs. Originally concerned with the birth of the god, the dithyramb came to deal with all his fortunes: then its scope became still larger; it might celebrate, not Dionysus alone, but any god or hero. This last development had taken place before the close of the 6th century B.C. Simonides wrote a dithyramb on Memnon and Tithonus; Pindar, on Orion and on Heracles. Hence the Alexandrian scholars used διθυράμβος in a wide sense, as denoting simply a lyric poem occupied with a mythical narrative. Thus Ode xviii. of Bacchylides (relating the voyage of Theseus to Crete), though it was clearly a παύδα for the Delian Apollo, was classed by the Alexandrians among his "dithyrambs"—as appears not only from its place in our MS., but also from the allusion of Servius (on Aen. vi. 21). The six dithyrambs of Bacchylides are arranged in (approximately) alphabetical order: Αρετηρομανία, Ηρακλής, Ηθύναι ή Ψαλτήρια, Ψαλτήρια, Τάνυας. The principal feature, best exemplified by the first and third, is necessarily epic narrative,—often adorned with touches of picturesque detail, and animated by short speeches in the epic manner.

Several other classes of composition are represented by these fragments of Bacchylides, preserved in ancient literature, which were known before the discovery of the new MS. (1) ποίμνια. Among these we hear of the ποίμνια των ατοπεπτυμων, hymns of pious farewell, speeded some god on his way to the season when he passed from one to another. (2) παύδαι, represented by the well-known fragment on the blessings of peace. (3) προοίμια, choral odes sung during processions to temples. (4) εὐπρόμαστα, lively dance-songs for religious festivals. (5) ἀριάδνη, represented by a few fragments of drinking-songs.

Under this head come some lively and humorous poems, one of power of wine, imitated by Horace (Odes, iii. 21, 73-80). It may be conjectured that the facile grace and bright fancy of Bacchylides were seen to especial advantage in light compositions of this kind. (6) The elegies of Bacchylides are represented by two Πεντάγραμμα ανθρωπομαχίας, each of four lines, in the Palatine Anthology. The first (Anth. vi. 313) is an inscription for an offering commemorative of a victory gained by a chorus with a poem written by Bacchylides. The second (Anth. vi. 53) is an inscription for a shrine dedicated to Zephyrus. Its authenticity has been questioned, but not disproved.

The papyrus containing the odes of Bacchylides was found in Egypt by natives, and reached the British Museum in the autumn of 1896. Mr. W. H. Stack, the secretary of the Egyptian department of the Royal Institute of Egyptology, and the late Mr. F. G. Kenyon, the editor of the edictio princeps (1897), the MS. was reconstructed from these lacerated members. As now arranged, the MS. consists of three sections. (1) The first section contains 22 columns (in two registers) of writing. It breaks off after the 8 opening verses of the first dithyramb in ode i. The second of column 23 is represented only by the last letters of two words. This column comprises what remains of Odes xii. and xiv. It breaks off before the end of xiv., which is the last of the epinikia. (3) The third section contains 24 columns (in two registers) of writing. It is terminated by the last lines of the last dithyramb in ode xvi. (4) The fourth section contains 20 columns (in two registers) of writing. It is continued by the last lines of the first dithyramb in ode xvi.

It is impossible to say how much has been lost between the end of column 29 and the beginning of column 30. Probably, however, Ode xiv., if not the last, was nearly the last of the epinikia. It is followed by a few fragments, written by Hesiod, of which the Alexandrians called Πεντάγραμμα ναοκομαχίας, and was therefore placed after the thirteen other epinikia, which are connected with the four great festivals. The same lacuna leaves it doubtful whether any collective title was prefixed to the διθυράμβος. After the last column (39) of the MS., a good deal has perished. Of the fragments of the final dithyrambs seem to have been three other poems of this class (on Cassandra, Laocoön and Philoctetes); and these would have come, in alphabetical order, after the last of the extant six (i.e., the last fragment) of the dithyramb. It is from these and other indications it is probable that the MS. is not later than the middle of the 1st century B.C.

The scribe, though he sometimes corrected his own mistakes, was, on the whole, careless of the sense, as of the metre; he seems to have been a mechanical copyist, excellent in penmanship, but...
intently only on the letters. The MS. has received corrections or small annotations from at least two different persons. One of them (Kenyon’s A) was contemporary, or nearly so, with the scribe. The other (Av) was considerably later; he wrote a Roman cursive which might belong to the end of the 1st century A.D., or to the early part of the 2nd. The corrections seem to be generally trustworthy, though, like the scribe, they were not intended to correct, passing over many metrical faults which could easily have been removed. They appear to have compared his MS. with another, or others; but they sometimes made a bad use of such aid, intruding a false reading where their text had the true one.

Breathings are generally added, especially rough breathings; the form is usually square, but sometimes partially rounded. Accent are added, not to all words, but to all words, with some difficulty to the reader. This was the Alexandrian practice, accents being regarded as aids to correct reading, and more liberally used when the dialect was not Attic. In accordance with the other system, the accent is not written on the last syllable of a word; when the accent falls there, a grave accent is written on the preceding syllable, or on two such syllables (e.g. θαλάς, παλάμης).

As Kenyon observes, no MS. of equal antiquity is so well supplied with accents. The MS. which comes nearest to it in this respect is the Alcan fragment in the Louvre, which is of similar or slightly higher age, belonging perhaps to the early part of the 1st century A.D.; and in that MS. the comparatively frequent accents were doubtless added by a scribe, who was not familiar with the Attic or Doric. With regard to other grammatical or metrical signs (syllabication) used in the Bacchylides MS., there is not much that calls for special remark. The punctuation, whether by the scribe or by correcors, is very sparse, and the correcors seem to be regarded by the scribe as emendating. In pound signs denoting the end of a strophe or antistrophe (paragraphus), of an epode (coronis), or of an ode (asterisk), are often omitted by the scribe, and, when employed, are sometimes placed incorrectly, or employed in an irregular manner.

Bacchus, Ed. princes (1597); F. Blass, 3rd ed. (1904); H. Jureska (1908); N. Festa, text, translation and notes (1898).

BACCO D’AGNOLO (c. 1460–1513), Florentine wood-carver, sculptor and architect, had the family name of Baglioni, but was always known by the abbreviation of Bartolommeo into Baccio and the use of d’Agnoletto as meaning the son of Angelo, his father’s name. He started as a wood-carver, and between 1491 and 1502 did much of the decorative carving in the church of Santa Maria Novella and the Palazzo Vecchio in Florence. Having made his reputation as a sculptor he appears to have turned his attention to architecture, and to have studied at Rome, though at what precise date is uncertain; but quite at the beginning of the 16th century he was engaged with Simon del Pollaiolo in the Palazzo Vecchio, and about 1502 he was commissioned to complete the façade of the Capella of the metropolitan church of Santa Maria del Fiore. The latter work, however, was interrupted on account of adverse criticism from Michelangelo, and it remained unfinished.

Baccio d’Agnoletto also planned the Villa Borghese and the Bartolini palace, with other fine palaces and villas. The Bartolini palace was the first house to be given frontispieces of columns to the door and windows, previously confined to churches; and he was ridiculed by the Florentines for his innovation. Another much-admired work by him was the campanile of the church of Santo Spirito. His studio was the resort of the most celebrated artists of the day, Michelangelo, Sansovino, the brothers Sangallo and the young Raphael. He died in 1543, leaving three sons, all architects, the best-known being Giuliano.

BACH, JOHANN SEBASTIAN (1685–1750), German musical composer. The Bach family was of importance in the history of music for nearly two hundred years. Four branches of it were known at the beginning of the 16th century, and in 1561 we hear of Hans Bach of Weimar who is believed to be the father of Veit Bach (born about 1550). The family genealogy, drawn up by J. Sebastian Bach himself and completed by his son Philipp Emanuel, describes Veit Bach as the founder of the family, a baker and a miller, “whose zither must have sounded very pretty among the clattering of the mill-wheels.” His son, Hans Bach, “der Spielmann,” is the first professional musician of the family. Of Hans’s large family the second son, Christoph, was the grandfather of Sebastian Bach. Another son, Heinrich, of Arnstadt, had two sons, Johann Michael and Johann Christoph, who are among the greatest of J. S. Bach’s forebears, Johann Christoph being now supposed (although this is still disputed) to be the author of the splendid motet, Ich lasse dich nicht ("I wrestle and pray"), formerly ascribed to Sebastian Bach. Another descendant of Veit Bach, Johann Ludwig, was admired more than any other ancestor by Sebastian, who copied twelve of his church cantatas and sometimes added work of his own to them.

The Bach family never left Thuringia until the sons of Sebastian went into a more modern world. Through all the misery of the peasant at the period of the Thirty Years’ War this clan maintained its position and produced musicians who, however local their fame, were among the greatest in Europe. So numerous and so eminent were they that in Erfurt musicians were known as “Bachs,” even when there were no longer any members of the family in the town. Sebastian Bach thus inherited the artistic tradition of a united family whose circumstances had deprived them of the distractions of the century of musical fermentation which in the rest of Europe had destroyed polyphonic music.

Johann Sebastian Bach was baptized at Eisenach on the 23rd of March 1685. His parents died in his tenth year, and his elder brother, Johann Christoph, organist at Ohrdruf, look care of him and taught him music. The elder brother is said to have been jealous of Sebastian’s talent, and to have forbidden him access to a manuscript volume of works by Froberger, Buxtehude and other great organists. Every night for six months Sebastian got up, put his hand through the lattice of the bookcase, and copied the volume out by moonlight, to the permanent ruin of his eyesight (as is shown by all the extant portraits of him at a later age and by the blindness of his last years). When he had finished, his brother discovered the copy and took it away from him. In 1700 Sebastian, now fifteen and thrown on his own resources by the death of his brother, went to Lüneburg, where his beautiful sopranino voice obtained him an appointment at the school of St Michael as chorister. He seems, however, to have worked more at instrumental than at vocal music. Apart from the choristers’ routine, his position provided only for his general education, and we know little about his definite musical instructors. In any case he owed his musical development mainly to his own incessant study of classical and contemporary composers, such as Frescobaldi (c. 1587), Caspar Kerll (1628–1663), Buxtehude, Froberger and Johann Pachelbel, and he was himself trained in the Latin literature, history and art of his time, and was also a very great scholar, and knew Latin, Greek and Hebrew.

Bach, J. S., Biograph. Leben und Werke (1751–1757), H. Keiser, Geschichte der Deutschen Poesie (1737), C. G. Friederich, Geschichte der Musik (1780–1781), A. L. J. von Schiller, Geschichte der Musik (1814–1817), and the author of the Grundsätze des Orchesters on which all later musical composers were trained. A prettier and no less authentic story than that of his brother’s forbidden organ-volume tells how, on his return from one of the many holiday expeditions which Bach made to Hamburg on foot to hear the great Dutch organist Reinken, he sat outside an inn longing for the dinner he could not afford, when two herring-heads were flung out of the window, and he found in each of them a ducat with which he promptly paid his way, not home, but back to Hamburg. At Hamburg, also, Keiser was laying the foundations of German opera on a splendid scale which must have fired Bach’s imagination though it never directly influenced his style. On the other hand Keiser’s church music was of immense importance in his development. In Celle the famous Hofkapelle brought the influence of French music to bear upon Bach’s art, an influence which inspired nearly all his works in suite-form and to which his many autograph copies of Couperin’s music bear testimony. Indeed, there is no branch of music, from Palestine onwards, conceivably accessible in Bach’s time, of which we do not find specimens carefully copied in his own handwriting. On the other hand, when Bach, at the age of nineteen, became organist at Arnstadt, he found Lübeck within easy distance, and there, in October 1705, he went to hear Buxtehude, whose organ works show so close an affinity to Bach’s style that only their lack of coherence as wholes reveals to the attentive listener that with all their nobility they are not by Bach himself. Bach’s enthusiasm for Buxtehude caused him to outstay his leave by three months, and this, together with his
habit of astonishing the congregation by the way he harmonized the chorales got him into trouble. But he was already too great an ornament to be lightly dismissed; and though his answers to the complaints of the authorities (every word of which makes amusing reading in the archives of the church) were spirited rather than satisfactory, and the consistorium had to add to their complaints the grave scandal of his allowing a "strange maiden" to sing in the church,\(^1\) Bach was able to maintain his position at Arnstadt until he obtained the organistship of St Blasius in Mühlhausen in 1707. Here he married his cousin, easily identified with the "strange maiden" of Arnstadt; and here he wrote his first great church cantatas, *Ausz der Tiefe, Gott ist mein König und Gutes Zeit.*

Bach's mastery of the keyboard attracted universal attention, and prevented his ever being unemployed. In 1708 he went to Weimar where his successes were crowned by his appointment, in 1714, at the age of twenty-nine, as Hofkonzertmeister to the duke of Weimar. Here the composition of sacred music was one of his most congenial duties, and the great cantatas, *Ich hatte viel Bekümmerniss,* was probably the first work of his new office. In 1717 Bach visited Dresden in the course of a concert tour, and was there invited by the arrogant French organist, J. Louis Marchand, who was making himself thoroughly disliked by the German musicians who could not deny his powers. Bach was first given an opportunity of hearing secretly at Marchand's playing, then a competition on the organ was proposed, and a day was fixed for the tournament at which all the court and all the musical celebrities of the town were to be present, to see nothing less than the issue between French and German music. Marchand took up the challenge contemptuously; but it would appear that he also was allowed to listen secretly to Bach's playing, for on the day of the tournament the only news of him was that he had left Dresden by the earliest coach.

This triumph was followed by Bach's appointment as Kapellmeister to the duke of Cöthen, a post which he held from 1717 to 1723. The Cöthen period is that of Bach's central instrumental works, such as the first book of the *Wohltemperirte Klavier,* the solo violin and violoncello sonatas, the Brandenburg concertos, and the French and English suites.

In 1723, finding his position at Cöthen uninspiring for choral music, he moved to Leipzig, where he became cantor of the Thomasschule, being still able to retain his post as visiting Kapellmeister at Cöthen, besides a similar position at Weissenfels. His wife had died in 1720, leaving seven children, of whom Friederich and Philipp Emanuel had a great future before them. (For his sons see Bach, K. P. E., below.) In December 1721 Bach married again, and for the beautiful soprano voice of his second wife he wrote many of his most inspired arias. She was a great help to him with all his work, and her musical handwriting soon became so like his own that her copies are difficult to distinguish from his autographs. In 1729 Bach heard that Handel was for a second time visiting Halle on his way back to London from Italy. A former attempt of Bach's to meet Handel had failed, and now he was too ill to travel, so he sent his son to Halle to invite Handel to Leipzig; but the errand was not successful, and much to Bach's disappointment he never met his only composer. Bach so admired Handel that he made a manuscript copy of his *Passion nach Brockes.* This work, though almost unknown in England then as now, was, next to the oratorios of Keiser, incomparably the finest Passion then accessible, as Graun's beautiful masterpiece, *Der Tod Jesu,* was not composed until four years after Bach's death. The disgusting poem of Brockes (which was set by every German composer of the time) was transformed by Bach with real literary skill as the groundwork of the non-scriptural numbers in his *Passion according to St John.*

All Bach's most colossal achievements, such as the *Passion according to St Matthew* and the *B Minor Mass* (for discussion of which see Oratorio and Mass), date from his cantorship at Leipzig. But, important and congregational as was his position there, and smooth as the course of his life seems to have been until his death in 1750, he must have had quite as much experience as can have been good for him. He was often ruffled by the town councillors of Leipzig, who (like his earlier employers at Arnstadt) were shocked by the "un ecclesiastical style" of his compositions and by his independent bearing. But he had more serious troubles. Of his seven children by his first wife only three survived him. By his second wife he had thirteen children, of whom he lost four of the six sons. For the head of so large a family his post was dignified rather than lucrative, and few documents tell a prouder tale of uncompelling thrust than the inventory of his possessions made after his death. One can only be thankful that he did not live to see anything but the wonderful promise of his son Friedemann, who, in the words of the brilliantly successful K. Philipp Emanuel Bach, was more nearly capable of replacing his father than all the rest of the family together. The prospect of complete loss of the tradition of his own polyphonic art he faced with equanimity, saying of the new style, which in the hands of his own son, Philipp Emanuel, was soon to eclipse it for the next hundred years, "The art has advanced to great heights: the old style of music no longer pleases our modern ears." But it would have broken his heart if he had foreseen that Friedemann Bach survived a dishonorable or disreputable old age after a dissolve and unproductive life.

The brilliant successes of Philipp Emanuel led to his appointment as court-composer to the prince of Prussia and hence, in 1747, to Sebastian's being summoned to visit Frederick the Great at Potsdam, an incident which Bach always regarded as the culmination of his career, much as Dr Johnson regarded his interview with George III. Bach had to play on the numerous newly invented pianofortes of Silbermann which the king had bought, and also to try the organs of the churches of Potsdam. Frederick, whose musical reputation rested on a genuine if narrow basis, gave him a splendid theme on which to extemporize; and on that theme Bach afterwards wrote *Das musikalische Opfer.* Two years after this event his sight began to fail, and before long he shared the fate of Handel in becoming perfectly blind.\(^2\)

Bach died of apoplexy on the 28th of July 1750. His loss was deplored as that of one of the greatest organists and clavier players of his time. Of his compositions comparatively little was known. At his death his MS. works were divided amongst his sons, and many of them have been lost; but a small fraction of his greater works was recovered when, after the lapse of nearly a century, the verdict of his neglectful posterity was reversed by the modern upholders of polyphonic art. Even now some important works are still apparently irrecoverable.

The rediscovery of Bach is closely connected with the name of Mendelssohn, who was amongst the first to proclaim by word and deed the powers of a genius too gigantic to be grasped by three generations. By the enthusiastic endeavours of Mendelssohn, Schumann and others, and in England still earlier by the performances and publications of Wesley and Crotch, the circle of Bach's worshippers rapidly increased. In 1850, a century after his death, a society was started for the correct publication of all Bach's remaining works. Robert Franz, the great song-writer, did good service in arranging some of Bach's finest works for modern performance, until the experience of a purer scholarship could prove not only the possibility but the incomparably greater interest of strict adherence to Bach's own scoring. ThePorson of Bach-scholarship, however, is Wilhelm Rust (grandson of the interesting composer of that name who wrote polyphonic suites and fantasies early in the 19th century). During the fourteen years of his editorship of the *Bach-Gesellschaft* he displayed a steadily increasing insight into Bach's style which has never since been rivaled. In more than one case he has restored harmonies of priceless value from incomplete texts, by means of research and reasoning which he sums up in a modest footnote that reads as something self-evident. His prefaces to the *Bach-Gesellschaft* volumes are perhaps the most valuable contributions to the criticism of 19th-century music ever written. Spitta's great biography not excepted.

\(^1\) Spitta points out that this cannot mean singing in the choir at a service, but making music in church privately.

\(^2\) The same surgeon operated unsuccessfully on both composers.
Bach's importance in the history of music cannot be exaggerated. His art, neglected as old-fashioned and crabbed by his younger contemporaries, survived only in certain limited aspects as the subject of a desultory and unintelligent academic study, until its re-discovery by Mendelssohn. And yet, whatever disguise may have been foisted on it by corrupt traditions and ignorance of its idioms, whenever any fragment of it gained the inner ear of a true composer the effect on the history of music was immediate and profound. Indeed his influence is by no means chiefly manifested in the time when his work became known in its larger aspects, though the Bach-revival is very obviously connected with certain tendencies in the "Romantic" movement in music. But, however clear we may consider Bach's claim to the title of "the first of Romantics," the full influence of his whole work has hardly yet begun to show itself. Schumann died before even such enthusiasts as the editors of the Bach-Gesellschaft began to find more beauty than extravagance in Bach's ordinary musical language (see, for example, Hauptmann's letters passim, The Letters of a Leipzig Conjuror, trans. by A. D. Coleridge, London, Novello, Ewer, 1892), or, indeed, to grasp the main features of his designs. The labours of the Bach-Gesellschaft continued more than fifty years, during which no less than about four-fifths of Bach's chorale works have been published for the first time; and it would be surprising if another fifty years sufficed to make these adequately known to the world at large. It is difficult to make an anthology of such bulky works as church-cantatas, nor does an anthology meet the purpose where the whole work so constantly attains that excellence for which the anthologist seeks. Except for practical difficulties (as when Bach writes for obsolete instruments) the only reason why some cantatas are better known than others is that a beginning must be made somewhere. Indeed, a cantata was recently selected, on the ground of its popularity, for a choral competition in a small English country town the year before it was performed as a novelty in Berlin!

It is clear, then, that the influence of Bach's art as an understood whole is still undeveloped. In the past history of music his part was hardly suspected except by the great composers themselves; and, to any one contemplating the art of the generation after him, it might have seemed that both he and Handel had worked in vain. Yet his was the most subtle and universal force in the development of music, even when his musical language seemed hopelessly forgotten. Mozart, when rapidly advancing to the height of his mastery, had but to read the Baron von Swieten's manuscript copies of the motets and of the Wohltemperirte Klavier, and his style, quite apart from his immediate essays in the old art-forms, and apart also from the influence of his study of Handel, developed a new polyphonic richness and depth of harmony which steadily increased until his untimely death. Beethoven studied all the accessible works of Bach profoundly, and frequently quoted them in his sketch-books, often with a direct bearing on his own works. His rendering of the Wohltemperirte Klavier is said to be recorded in the marks of expression and tempo given in Czerny's edition; and if that record is true, Beethoven must have been completely in the dark as to Bach's meaning in many important respects; but art is full of such illustrations of the way in which great minds influence each other in spite of every barrier which diversity of language and time can set. Beethoven's great Thirty-three Variations on a Waltz by Diabelli were actually described in the publisher's puff as worthy of their kinship with the "Goldberg Variations" of Bach; and that kinship is revealed in its true light by a comparison between Beethoven's 31st variation and Bach's 25th; for here, just where the resemblance is most obvious, each composer utters his most intimate expression of feeling.

In the same way, Chopin is nowhere more characteristic than where he shows his love of the Wohltemperirte Klavier in his Études and Preludes; and so subtle is the influence of polyphonic style even over a writer so apt to make direct use of it as Chopin, that one of Schumann's few plagiarisms occurs in his use of a phrase from Chopin's F minor Étude (written for the Méthode des méthodes) as the subject of a fugue (Op. 72, No. 3). And, apart from fugues, which Schumann cultivated assiduously at a late stage in his career, the influence of Bach pervades the texture and rhythm of his work in more ways than can easily be followed.

In a more external, but not less significant way, the Passion according to St Matthew made its mark on Mendelssohn from the time when he discovered it at the age of twelve, and suggested to him many features in the general design of oratorios, by means of which he rescued that branch of art from the operatic influences that ruined Beethoven's Mount of Olives. Without the example of Bach, Wagner's schemes of Leitmotif would never in his lifetime have become woven into that close polyphonic texture which secures for his music a flow as continuous as that of drama itself—and intimately connected with this is the whole subject of Wagner's harmonization, which in many of its boldest characteristics was foreshadowed by Bach. A close study of the texture of Brahms's work shows that he develops Bach's and Beethoven's ideas into a very close parallelism as an aid to complete unification of that opposition between polyphony and form which in the infancy of the sonata (as in every transitional stage in musical history) threatened to wreck the art as a false antithesis wrecks a philosophy. Perhaps the only great composers who escaped the direct influence of Bach are Gluck and Berlioz. Even Gluck reproduced in every detail of harmony and figure the first twelve bars of the Gigue of Bach's B flat Clavier-Partita in the aria "Je t'implore et je tremble" in Iphigénie en Tauride. But plagiarism, however unconscious, is a very different thing from that profound indebtedness which makes a great man attain his truest originality; and Gluck's training practically deprived him of Bach's direct influence, useful as that would have been to the attainment of his aims in harmonic and choral expression. The indirect influence no one could escape, for whatever in modern music is not traceable to Sebastian Bach is traceable to his sons, who were encouraged by their father in the cultivation of those infant art-forms which were so soon to dazzle the world into the belief that his own work was obsolete.

Bach's place in music is thus far higher than that of a reformer, or even of an inventor of new forms. He is a spectator of all musical time and existence, to whom it is not of the smallest importance whether a thing be new or old, so long as it is true. It is doubtful whether even the forms most peculiar to him (such as the arpeggio-prelude) are of his invention. Yet he left no form as he found it,—not even that most conventional of all, the Da Capo Aria, which he did not outwardly alter in the least. On the other hand, with every form he touched he said the last word. All the material that could be assimilated into a mature art he vitalized in his own way, and he had no imitators. The language of music changed at his death, and his influence became all-pervading just because he was not the prophet of the new art, but an unbiased seeker of truth. Whether so great a man becomes "progressive" or "reactionary" depends on the artistic resources of his time. He will always be needed at the stage that is most complete and consistent in all its aspects. The same spirit of truthfulness that makes Sebastian Bach hold himself aloof from the progressive art which he encourages in his sons, drives Beethoven to invent new forms and new means of expression with every work he writes. Gluck abolished the Da Capo Aria, because it was unfit for dramatic music. Bach did not abolish it, because he did not intend to write dramatic music in the strict sense of the term. Mature musical art in Bach's time could not be dramatic, except in the loose sense in which the term may be applied to an epic poem. Dramatic expression, properly so called, can only be attained in music by the full development of resources that do not blend with those of Bach's art at all. Meanwhile there are many things unsuitable for the stage which are nevertheless valuable on purely musical grounds; and the Da Capo Aria was one. Bach

1 See the wild conjectures of the editor of the Four Short Masses as to the "displacing" of structure in the Kyrie of the G minor Mass (B.-G., Jahr. vili. preface, with Rust's answer in the preface to Jahr. xxiii.).
developed it in a great variety of ways, while retaining even the minor details of what in other hands had long before become its conventional form; but the one thing he did not do was to abuse it according to time-honoured custom as the staple form for opera. For that he had too much dramatic insight. His treatment of other important art-forms is illustrated in the articles on CONTRAPUNTAL FORMS; CONCERTO and INSTRUMENTATION. Here we may attempt to illustrate his methods by some forms and characteristics as cannot be classified under those headings.

1. The toccatas of Buxtehude and his predecessors show how an effective musical scheme may be suggested by running over the keyboard of an organ as if to try (toccare) the touch, then bursting out into sustained and full harmony, and at last settling down to a fugue. But before Bach no one seemed able to keep the fugue in motion long enough to make a convincing climax. Very soon it collapsed and the process of quasi-extemporization began again, to culminate in a new fugue which often gave the whole work a happy but deceptive suggestion of organic unity by being founded on an ingenious variation of the subject of the first fugue. But in Bach's hands the toccata becomes one of the noblest and most plastic of forms. The introductory runs may be disjointed and exaggerated to grotesqueness, until the gaps between them gradually fill out, and they build themselves up into grand piles of musical architecture, as in the organ toccata in C; or they may be worked out on an enormous scale in long and smooth canonic passages with a definite theme, as in the greatest of all toccatas, that in F for organ, which is most artistically followed by a fugue unusually quiet for its size. In one instance, the toccata at the beginning of the E minor clavier-partita, the introductory runs, though retaining much of the extempore character from which the form derives its name, take shape in a highly organized and rounded-off group of contrasted themes. The fugue follows without change of time, and is developed in so leisurely a manner that it is fully as long as a normal fugue on a large scale by the time it reaches what sounds like its central episode. At this point some of the introductory matter quietly enters, and leads to a recapitulation of the whole introduction in the key now reached. The obvious sequel would be a counter-development of the fugue, at least as long as what has gone before, as in the clavier-toccatas in C minor; but Bach does not choose to weary the hearer and weaken the impression of breadth he has already made here. Instead, he expands this restatement of the introduction so that it makes its harmonies deliberately return to the fundamental key, and thus in an astonishingly short time the toccata is brought to a close with the utmost effect of climax and finality. The same grasp of all the possible meanings of an artistic device shows itself in his treatment of the other features of toccata form. With its variety of proportion and flow he has no need to break off the fugue like earlier composers: but all the old devices by which the division into sections was managed are turned to account by him, and almost every toccata has its own scheme of contrasted movements, always based on the old natural idea of the growth of an organized music from a chaos of extemporization.

If this is Bach's treatment of a comparatively small and specialized art-form, it is obviously impossible to reduce the scantiest account of the rest of his work into practical limits here, nor is there as yet a sufficient body of accepted criticism of Bach for such an account to carry further conviction than an expression of individual opinion. Fortunately, however, Bach was constantly re-arranging his own compositions; indeed he evidently regarded this adaptability to fresh environment as the test of his finest work; and we cannot do better than review the evidence thus given to us,—evidence which only Beethoven's sketch-books surpass in significance.

2. The successful transplanting of a work of art to a fresh environment is obviously the convincing test of our definitions of the art-forms concerned, if only we take care to distinguish between the alterations produced by the change of environment and those that imply the composer's dissatisfaction with the original version. In Bach's case this seldom causes much difficulty; his methods of adaptation are so logical and so varied as to form a scheme of musical morphology with all the interest and none of the imperfections of the geological record; and the few cases in which a work owes its changes to the need for improvement as well as adaptation cause no confusion, but rather form a link between the pure adaptations and the numerous revisions of his favourite works without change of medium. There is, for example, no difficulty in separating the element of corrective criticism from that of the impulse to give an already successful composition a larger or more permanent form, in such cases as the transformations undergone by the movements of the birthday cantata, Was mir behagt ist nur die muntre Jagd, during their distribution among the church cantatas, Also hast Gott die Welt geliebt and Man singet mit Freuden vom Sieg. The fine bass aria, "Ein Fürst ist seines Landes Pan," was obviously ill-proportioned, with its breakneck return to the tonic and its perfunctory close; and Bach's chief concern in adapting it for its place as the aria, "Du bist geboren mir zu Gute," in Also hast Gott, was to remedy this defect. On the other hand, the use of the delightful ritornello for violoncello from the little aria, "Die Welt die wolkenreichen Heerden," in the birthday cantata, and the restoration of the rejected long instrumental fugues that was to follow, were obviously brought about by the conception of the entirely new material for the voice in the famous aria, "Mein gläubiges Herz." And when the last chorus of Was mir behagt became the first chorus of Man singet mit Freuden, it was expanded to the proportions necessary for a triumphant opening (as distinguished from a cheerful finale) by the adroit insertion of new material between every joint in the design. This material, being new, could not produce the effect of diffuse ness that would result from the expansion of the old material already complete in its simplest form, and thus this instance does not imply criticism.

A highly interesting example of pure self-criticism is the Passion according to St. John, which was twice revised, and each time reduced to a smaller scale by the omission of some of its finest numbers. The final result was a work of perfect proportions, and of the rejected numbers one (a magnificent aria with chorale) remained unused, two were replaced by finer substitutes, others took shape as one of the most complete and remarkable of the church cantatas, Du wahrer Gott, while the greatest of the figured choruses was transferred to the Passion according to St. Matthew, of which it now forms the first part.

3. Such instances of self-criticism might be paralleled in the works of other composers; but there is no parallel in music to Bach's power of reproducing already perfect works in different media. Here Bach reveals to us identities in difference which we should otherwise never have suspected. Of course it is possible to arrange works in different ways without illustrating any profound identities at all. Handel, for instance, collected several of his favourite choruses in an enormous instrumental concerto (see vol. 46 of the Händel-Gesellschaft), and the result in the case of a chorus like "Lift up your Heads" was ridiculous. Bach, however, does not arrange old work merely to please a court where it was already admired; he never leaves it in a state of mere make-shift, though he cannot always attain his evident aim of a new originality. His methods of orchestration and the profoundly significant identity of certain forms of chorus with certain concerto forms may better be described under their proper headings (see articles INSTRUMENTATION and CONCERTO). Here we will attempt first to show, by illustrations of Bach's power of adding parts to already complete harmonic and contrapuntal schemes, what was his conception of the nature of an art-form, and secondly, by means of a short analysis of cases in which he adapts the same music to different words, to define his range of expression.

Bach arranged all his violin concertos for clavier, including two that are lost in the original version. Here his power of providing new and apparently necessary material for the left hand of the cembalist (or, in the double concertos, two first
BACH, J. S.

hands) without disturbing the already complete score, is astonishing; and it fails only in the slow movements, which he prefers to leave obviously in the condition of an arrangement rather than to spoil their broad cantabile style by a too polyphonic bass.

But these cases are insignificant compared with such transformations as that of the prelude of the E major partita for unaccompanied violin into the sinfonia for organ obbligato accompanied by full orchestra (including three trumpets and a pair of drums) at the beginning of the church cantata, Wir danken dir, Gott. The original version is perhaps the most complete and natural of the violin solos, for its arpeggios produce full harmony without recourse to that constant attempt to play on all four strings at once, which makes the performance of the polyphonic movements a tour de force in which steady rhythm is nearly impossible. Yet in the sinfonia its proportions seem to reveal themselves for the first time. Not a bar is displaced and not a note of the new accompaniment is unnecessary. The whole is almost entirely without themes; for even this, the largest of all arpeggio-preludes, consists essentially of the gradual unfolding of a scheme of harmony in which rhythmic and melodic organisation is reduced to a minimum. Only in the first line does the incisive figure persist a little longer in the new accompaniment than in the original solo, but on the last page it reappears and pervades the whole orchestra, even the drums thundering out its rhythm at the climax where the holding-notes of the trumpet span the torrent of harmony like a rainbow.

Deeper still is the thought that underlies the transformation of two movements of the great violin-concerto in D minor (unfortunately lost except in its splendid arrangement for clavier) into parts of the church cantata, Wir müssen durch viel Tribulsa in das Reich Gottes eingehein. In both movements the violin is replaced by the organ an octave lower, the orchestral accompaniment remaining where it was. This treatment, with the addition of new and plaintive parts for wind instruments, turns the already very long and sombre first movement into an impressive idealization of the "much tribulation" that lies between us and the kingdom of heaven. The slow movement is still more solemn, and is arranged in the same way as regards the instruments; but from the first note to the last the church sings, to the words of the title, a mass of quite new material (except for the bass and for numerous imitations of the solo-part), treated with every variety of vocal colouring and a grandeur of conception which is not dwarfed even by the Passion according to St Matthew.

4. The four short masses, the Christmas oratorio and the B minor mass, contain every variety of adaptation from earlier work. The four short masses are indeed obviously compiled for use in a church where the orchestra was small. Only four movements in the whole collection are not traceable to other extant works; all the rest come from church cantatas. The adaptations are not always significant: no attempt, for example, is made in the G minor mass to conceal how unfit for a Kyrie elegion is the tremendous denunciatory chorus, Herr, deine Augen sehn nach dem Glauben. But the F major and G major masses are very instructive; and the A major mass, except for the damage done to the instrumentation, is a work that no one would conceive to be not original. The Kyrie is one of Bach's most individual utterances and could surely never have fitted any other text, but we should say the same of the Gloria if we did not possess the church cantata, Halt im Gedächtniss. The Gloria begins with a triumphant polyphonic chorus accompanied by a spirited symmetry for strings. At the words "et in terra pax" the time changes, and two flutes softly accompany a simple solemn melody in the alto. At the "laudamus te" the material of the beginning returns, and is interrupted again by the calm slow movement, this time in another key and for another voice, at the words "adoramus te." Twice the "laudamus" and "adoramus" alternate in a finely proportioned design; at last the words "gratias agimus tibi propter magnam gloriam tuam" are set for the full chorus to the music of the slow movement, the strings join with the flutes, and this most appropriate setting of those words is finished. And yet it is quite impossible to regard this as superseding the last chorus of Halt im Gedächtniss. Not one bar or harmony of the framework differs; yet the two versions are two independent works of art. In the cantata the beginning is for instruments only; when the slow movement (here adequately scored for a flute and two oboe d'amore) begins, the basses, permanently separated from the rest of the chorus, sing "Peace be unto you." The other voices then sing the triumph of the faithful helped by the Saviour in their battle against the world. The slow movement is, of course, set for bass alone throughout, and at the last recurrence of the allegro the basses, nearly reformed, separate from the rest of the chorus, singing "Friede sei mit euch" through the rest of the chorus, as if leading the chorus of humanity through strife to the kingdom of heaven, and then the single voice of peace remains to the end. Hardly a bar of the chorus-material is on the same themes in the two versions.

The study of the sources of the Christmas oratorio will complete the evidence on which we support our estimate of Bach's methods and range of expression. It is certain that the occasional cantatas, from which all except the chorale-tune numbers and those set to words from the Bible were taken, date from shortly before the oratorio, and by Bach, being incapable of putting inferior work even into his own oblivion, having ventured by having the verses for the oratorio numbers built on the same rhythms as those of the odes in order that he might use those occasional works as a sketch (see B. G. Jahrb. xxxiv. pref). Be this as it may, the alterations are confined to details even where an aria is transposed a fourth or fifth; but the effect of them is startling. Pleasure (Wollust) sings a lovely soprano aria to allure Hercules from the paths of Virtue, to which Hercules replies indignantly with an aria in a spirited staccato style. It is no doubt a shock to our feelings to find that Wollust's aria became the Virgin's cradle-song, while Hercules's reply became the alto aria in which Zion is bidden to "prepare for the Bridegroom." But it does not warrant the inference that Bach's music lacks definite characterization: on the contrary, these two arias are the best demonstration of his profound insight into the possibilities of musical expression within his range. It is no part of his conception of art that Wollust should be followed by a Wagnerian Venusberg-music; the obvious way to represent Pleasure was by writing pleasant music, and with Bach's ideas of pleasance the step from this to the solemn beauty of the sacred cradle-song was a mere matter of change of colour and tempo. The key is lowered from B flat to G, the strings are veiled with the tender reed tone of a group of oboe d'amore, the soprano becomes an alto whose notes are, as it were, surrounded with a nimbus by being doubled in the upper octave by a flute; and the aria becomes worthy of its new purpose, not by losing a grossness which it never possessed, but by gaining the richness which distinguishes the perfect work from the boldly executed draft.

As to the aria of Hercules the change is in manner, while the character, in the human sense of the term, is quite rightly the same. Both Hercules and the faithful Christian of the oratorio are renouncing pomps and vanities for the claims of a higher life; in the one case indignantly, in the other case inspired "mit ärztlichem Triebe." A change to a legato style, the substitution of a single oboe d'amore for tutti violins, the addition of delicate ornamentation indicative of a slower pace, and the noble stream of melody preserve its identity while changing its aspect. Bach's larger designs react on their changing contents as a cathedral reacts on the impressiveness of the rites performed within it, or as nature reacts on a poet's thoughts; and in the same way Bach's melody is greater than any possible mood of the moment, not because of that vague and negative pseudo-classical quality misnamed "reserve," but because of its vital individuality. In their proper directions its changes are limitless; elsewhere change in inconceivable. No amount of "Umarbeitung" could, for instance, turn the aria of Hercules into the Virgin's cradle-song, or Wollust's aria into the exhortation to Zion to prepare for the Bridegroom. In short, Bach's melodies are characteristic, not like a mask with a set expression, but like a living face that is the more individual for the mobility of its features.
Within these limits, that is, short of dramatic expression in just so far as "the end of drama is not character but action," there is nothing good that Bach's art does not express. He has plenty of humour, if the term may be applied to art which is, so to speak, always literal,—art in which a jest is a jest and serious things are treated with familiar directness, and all, whether in jest or earnest, is primarily beautiful. In *Der Streit zwischen Phoebus und Pan* Bach answers the critics who censured him for his pedantry and provincial ignorance of the grand Italian operatic style, by making effective use of that style in Pan's prize-aria ("Zum Tanze, zum Sprunge, so wack-ack-ackelt das Herz"), nobly representing his own style in Phoebus's aria, and promptly caricaturing it in the second part of Pan's ("Wenn der Ton zu mühsam klingt"). Midas votes for Pan—" denn nach meinen beiden Ohren singt er unvergleichlich schön." At the word "Ohren" the violins give a pianissimo "hee-haw" which is fully as witty in its musical aptness as Mendelssohn's clown-theme in the Overture to the *Midsummer Night's Dream*; and in the following dialogue their prophecy is verified. As with many other great artists, Bach's playfulness occasionally showed itself inconveniently where little things shock little minds. The hilarious aria, "Ermutre dich," in the church cantata, *Schmücke dich, o liebe Seele*, is one instance, and the quaint representation of the words "diminuit inanes" in the *Magnificat* is another. This great work, one of the most terse and profound things Bach ever wrote, contains, among many other subtle inspirations, one conception with which we may fitly end our survey, for it strongly suggests Bach himself and the destiny of all that work which he finished so lovingly, with no prospect of its becoming more than a family heirloom and a salutary tradition in his Leipzig choir-school. In the *Magnificat* he sets the words "quia respexit humilitatem ancilie suæ" to a touchingly appropriate soprano solo accompanied by his favourite oboe d'amore. With the next sentence "ecce enim beantam te dicent" the tone brightens to a quiet joy, but Bach takes advantage of the syntax of the Latin in a way that defies translation, and the sentence is finished by the chorus. "Omnès generationes" seem indeed to pass before us in the crowded fugue which rises in perpetual strettto, the incessant entries of its subject now mounting the whole scale, each part a step higher than the last, and now coiling in union with a climax of closeness and volume overwhelming in its impression of time and multitude.

**SUMMARY OF BACH'S WORKS**

No attempt is here made at chronological sequence. The changes in Bach's style, though clear and important, are almost impossible to describe in untechnical language; nor are they of such general importance as to justify the attempt at a detailed account, which it would be worth while to expand this summary by an attempt to apporition its contents among the Arnstadt-Mühlhausen period, the Weimar period, the Cöthen period (chiefly remarkable for instrumental music and comparatively uninteresting in its easy-going choral music), and the last period (1733–1750) in which, while the choral works became at once more numerous and more terse (e.g. *Jesu, der du meine Seele*) the instrumental music, though never diffuse, shows an increasing preference for designs on a large scale. (Compare, for example, the second book of the *Wohltemperirte Klavier*, 1722, with the first, 1722.)

**I. CHURCH MUSIC**

**A. With Orchestra**

190 church cantatas: besides several which are only known from fragmentary sets of parts. Of the 190, 40 are for solo voices, about 60 (including some solo cantatas) are more or less founded on chorales, and the rest, though almost invariably containing a chorale (for congregational singing), are practically short oratorios and frequently so entitled by Bach himself.

3 wedding cantatas: the Easter oratorio (exactly like the above-mentioned oratorio-cantatas) and the Christmas oratorio (six similar cantatas forming a connected design for performance on six separate days).

The Passions according to St Matthew and St John.

**B. Without Orchestra**

5 motets a capella (but there is reason to believe that these, except *Komm Jesu komm*, were intended to be partly supported by the organ). A sixth motet has an obligato figured-bass accompaniment. A few early choraluses, mostly turned to account in later works. A large collection of plain chorales, including several original melodies.

**II. SECULAR VOCAL MUSIC**

*Der Streit zwischen Phoebus und Pan* and *Der zuvielen gestellt Aesopus*; both entitled *Drumma per Musica*, but showing no more essential connection with the stage than Handel's *Adeus and Galatea*.

7 solo and 7 choral cantatas, of which latter three were almost entirely absorbed into the Christmas oratorio and the B minor mass. Of the solo cantatas two are Italian (one of these being Bach's only developed work for voice and clavier) and two are burlesques. Several tunes with clavier bass, almost foreshadowing the modern song.

**III. INSTRUMENTAL MUSIC**

**A. Orchestral**

7 clavier concertos arranged from violin concertos and other sources.

3 concertos for two claviers (two being arranged from concertos for two violins).

5 concertos for three claviers.

The 6 Brandenburg concerts, for various combinations.

2 violin concertos, and a colossal *tusorio* of a concerted violin-movement forming the prelude to a lost church cantata.

1 concerto for two violins.

1 clavier concerto.

**B. Chamber Music**

3 sonatas for clavier and flute: a suite and 6 sonatas for clavier and violin, 3 for clavier and viola da gamba; 2 trios with figured bass; 2 flute-sonatas and a violin suite with figured bass; 6 sonatas (i.e. 3 sonatas and 3 partitas) for violin alone; 6 suites for violoncello alone.

**C. Clavier and Organ Music**

Bach's own collections are:

1. *Das wohltemperirte Klavier* for clavichord: two books each containing 24 preludes and fugues, one in each major and minor key; with the objects above mentioned. (The projected "equal temperament" instead of sacrificing the euphony of remotest keys to that of the more usual ones.)

2. *Klavier-Übung* (chiefly for harpsichord) in four books containing 152 two-part inventions and 15 three-part symphonies.

3. *The Goldberg variations*, 4 duets, and an important collection of organ choral-preludes, with the "Ster Anne" prelude and fugue in E flat. (iv.) The Italian concerto and French overture.

4. The 6 "French" and 6 "English" suites.

The other clavier works fill two *Jahrgänge* of the *B.-G.*

Bach's collections of organ music are (besides that included in the *Klavier-Übung*) 1) the *6 etc. Sonatas* and *26 fugues* contained in the *Klavier-Übung", 2) 6 organ preludes and fugues. (3) Das *Orgelbüchlein*, a collection of short choral-preludes carefully planned—all the blank pages of the autograph being headed with the titles of the chorales intended for them. Not half of this collection was done. (The projected "equal temperament" would have been a larger volume than the *Wohltemperirte Klavier*, 4) 18 larger choral-preludes, including Bach's last composition. (5) The *6 Schübler* chorales, all arranged from movements of cantatas.

Besides these there are the three great independent toccatas and the Passacaglia. The remaining choral-preludes fill one *Jahrgang* and the other organ works two more.

**D. Unclassified**

Two important instrumental works cannot be classified, viz. *Das musikalische Offer*, the volume of compositions (two great fugues, various puzzle-canons, and a splendid trio for flute, violin and figured bass) the two already given to Bach by Frohbeck the Greath and *Die Kunst der Fuge*, a progressive series of fugues on one and the same subject, written in open score as if entirely abstract studies, but all (except the extreme contrapuntal tunes de force) in admirable clavier style and of great musical value.

**IV. LOST WORKS**

**A. Choral**

J. N. Forkel's statement that Bach wrote 5 *Jahrgänge* of church cantatas (i.e. enough to provide one for each Sunday and holy day throughout the year) would indicate that some 80 are lost, but there is reason to believe that this is a great exaggeration. Not more than six or seven cantatas are known to be lost, by the evidence of fragments, text-books, &c.

Forkel also says that Bach wrote five Passions. Besides the great Matthew and John Passions there is in an indisputable Bach autograph one according to St Luke; but it is so worthless that the best plea for its authenticity offered by responsible critics is that it has a personal interest could have induced Bach to make a copy of it.
BACH, K. P. E.

The lost passion according to St Mark must, judging by the movements preserved in the Trauer-Ode, have been larger than that according to St John.

Was there a genuine Lucas-Passion? If so, Fornell's report of five quasissas and the claim that all lost secular works are partly preserved in those portions of the Christmas oratorio where the sources are not definitely known, but which, like the other duplicated numbers, are fair copies in the autograph.

B. Instrumental

Three violin concertos and one for two violins; known only from the wonderful clavier versions.

Most of the first movement of the A major sonata for clavier and flute was intended but not actually written down; it is preserved at the bottom of a larger score. Some of these have been cut off.

V.—ARRANGEMENTS OF WORKS BY OTHER COMPOSERS

Arrangements for harpsichord alone of 16 concertos, generally described as by Vivaldi, but including several by other composers.

4 Vivaldi concertos arranged for organ.

Many of these arrangements contain much original matter, such as are constantly made (copies of all that interested him; and where the outside sheet is lost, only the music itself can tell us whether it is his or not. The above-mentioned Passion according to St Luke is the chief case in point. The little music-books he arranged for his son would have been for the performance of the most various styles; and the editors of the Bach-Gesellschaft have not completely identified them, even Couperin’s well-known ‘Les Bergeries’ escaping their scrutiny. A sonata for two claviers by Böhm, of which the original sheet was deposited in the editors after its inclusion in Jahrgang xliii.

The second of the 3 sonatas for clavier and flute is extremely suggestive of Bach’s sons, and Philipp Emanuel ascribes it to his father. However, it might easily have been completed wrongly while arranging copies of his father’s works. It has a twin brother (B.G. xix. Anhang ii.) for which he has not vouchè.

Four absurd church cantatas are printed for concènce sake in Jahrgang xlv. and xlvii. worth performing in public by people who have been afterwards suddenly converted, but with the warning that the printer was honestly mistaken. For the reprinted cantatæ of B minor mass was also worked over again; and Kroll’s text of the Wohltemperirtes Klavier was amended by the evidence of the British Museum autograph. B. Instrumental

The Steingräber edition of the clavier works, edited by Dr Hans Bischoff, is incomparably the best, giving all the variants in footnotes and clearly distinguishing the extremely intelligent nuances and phrasing signs of the editor from the rare but significant indications of Bach himself. Nor does this wealth of scholarship interfere with the presentation of a straightforward text, and it may reasonably be said that there is every necessary explanation of the ornaments and kindred matters.

We have seen no other editions that distinguish Bach’s text from the editor’s text—the disappointing publications of the Neue Bachgesellschaft by no means excepted. We may think that the older vocal scores of cantatas in the Edition Peters are, unfortunately but a selection, far better than the complete series issued by Breitkopf and Härtel in conformity with the Bach Gesellschafts program of a straight-forward text (see Introduction).

The English vocal scores published by Novello are generally very good though covering but small ground. The Novello score of the Christmas oratorio contains a fine analytic preface by Sir George Macmillan.

BIBLIOGRAPHY.—J. N. Forkel, Über Bach’s Leben, Kunst und Kunstwerke, translated (London, 1820); C. H. Bitter, Johann Sebastian Bach (Berlin, 1863); Ernest David, La Vie et les œuvres de Bach (Paris, 1887); P. Spitta, Johann Sebastian Bach (Leipzig, 1873 and 1880); E. Heinrich, Johann Sebastian Bach’s Leben (Berlin, 1885); A. Pirro, L’Esthétique de Jean Sebastian Bach (Paris, 1907); and L’Orgue de Jean Sebastian Bach (Paris, 1907); A. Schweitzer, J. S. Bach: Le Musicien (Berlin, 1925). Biography and criticism written before 1800 is almost certainly not accurate. With corrections in the light of Rust’s B. G. prefaces it contains everything worth knowing about Bach, except the music itself.

BACH, KARL PHILIPP EMANUEL (1714–1788), German musician and composer, the third son of Johann Sebastian Bach, was born at Weimar on the 14th of March 1714. When he was ten years old he entered the Thomasschule at Leipzig, of which he in 1723 had become cantor, and continued his education as a student of jurisprudence at the universities of Leipzig (1731) and of Frankfurt on the Oder (1735). In 1738 he took his degree, but after once abandoned all prospects of a legal career determined to devote himself to music. A few months later he obtained an appointment in the service of the crown prince of Prussia, on whose accession in 1740 he became a member of the royal household. He was by this time one of the first claviers played in Europe, and his compositions, which date from 1731, included about thirty sonatas and concerted pieces for his favourite instrument. His reputation was established by the two sets of sonatas which he dedicated respectively to Frederick the Great (1742) and to the crown prince (1744); and in 1746 he was promoted to the post of Kammermusiker, and for twenty-two years shared with Karl Heinrich, Graun, Johann Joachim, Quantz and Johann Gottlieb Naumann the continued favour of the king. During his residence at Berlin he wrote a fine setting of the Magnificat (1749), in which he shows more traces than usual of his father’s influence, an Easter Cantata (1756), several symphonies and concerted works, at least three volumes of songs, —Geistliche Oden und Lieder, to words by Gellert (1758), Oden mit Melodien (1762) and Sing-Öden (1766) — and a few secular cantatas and other pièces d’occasion. But his main work was concentrated on the clavier, for which he composed, at this time, nearly two hundred sonatas and other solos, including the set mit veränderten Reprisen (1760–1768) and a few of those for Kenner und Liebhaber. Meanwhile he placed himself in the forefront of European critics by his Versuch über die wahre Art das Clavier zu spielen (first part 1753, second, with the first reprinted, 1762), a systematic and masterly treatise which by 1780 had reached its third edition, and which laid the foundation for the modern clavier school.

In 1768 Bach succeeded Georg Philipp Telemann as Kapellmeister at Hamburg, and the consequent of his new office began to turn his attention more towards church music. Next year he produced his oratorio Die Israeliten in der Wüste, a composition remarkable not only for its great beauty but for the resemblance of its plan to that of Mendelssohn’s Elijah, and between 1769 and 1788 added over twenty settings of the Passion, a second oratorio Der Auferstehung

1 The object of the Neue Bachgesellschaft is to render the completed results of the first Bachgesellschaft generally accessible by holding frequent Bach festivals and issuing cheap and practical editions. The activities of this society, together with the new edition of the core Bach’s vocal music to its place in the Lutheran Church, cannot fail to have a salutary effect on the future of music.
and Himmelfahrt Jesu (1777), and some seventy cantatas, litanies, motets and other liturgical pieces. At the same time his genius for instrumental composition was further stimulated by the career of Haydn, to whom he sent a letter of high appreciation, and the climax of his art was reached in the six volumes of sonatas für Kenner und Liebhaber, to which he devoted the best work of his last ten years. He died at Hamburg on the 14th of December 1788.

Through the latter half of the 18th century the reputation of K. P. E. Bach stood very high. Mozart said of him, "He is the father, we are the children"; the best part of Haydn's training was derived from a study of his work; Beethoven expressed for his genius the most cordial admiration and regard. This position he owes mainly to his clavier sonatas, which mark an important epoch in the history of musical form. Lucid in style, delicate and tender in expression, they are even more notable for the freedom and variety of their structural design; they break away altogether from the exact formal antithesis which, with the composers of the Italian school, had hardened into a convention, and substitute the wider and more flexible outline which the great Viennese masters showed to be capable of almost infinite development. The content of his work, though full of invention, lies within a somewhat narrow compass, but it is marked by sincerity in his faith and felicitous phrase. Again he was probably the first composer of eminence who made free use of harmonic colour for its own sake, apart from the movement of contrapuntal parts, and in this way also he takes rank among the most important pioneers of the school of Vienna. His name has now fallen into undue neglect, but no student of music can afford to disregard his Sonaten für Kenner und Liebhaber, his oratorio Die Israeliten in der Wüste, and the two concertos (in G major and D major) which have been republished by Dr Hugo Riemann.

A list of his compositional works may be found in Eitner's Quellen Lexikon, and a critical account of them is given in Bitter's C. P. E. und W. F. Bach und deren Brüder (2 vols., Berlin, 1863), a mine of valuable though ill-arranged information.

Four more of Johann Sebastian Bach's sons grew to manhood and became musicians. The eldest of them, WILHELM FRIEDMANN BACH (1710-1784) was by common repute the most gifted; a famous organist, a famous improvisor and a complete master of counterpoint. But, unlike the rest of the family, he was a man of idles and dissolute habits, whose career was little more than a series of wasted opportunities. Educated at Leipzig, he was appointed by his father organist of the Sophienkirche at Dresden, and in 1747 became musical director of the Liebfrauenkirche at Halle. The latter office he was compelled to resign in 1764, and thenceforward he led a wandering life until, on the 1st of July 1784, he died in great poverty at Berlin. His compositions, very few of which were printed, include many church cantatas and instrumental works, of which the most notable are the fugues, polonaises and fantasias for clavier, and an interesting set of strings, clarinet and horns. Several of his manuscripts are preserved in the Royal library at Berlin; and a complete list of his works, so far as they are known, may be found in Eitner's Quellen Lexikon.

The fourth son, JOHANN GOTTFRIED BERNHARD BACH (1715-1730) was, like his elder brothers, born at Weimar and educated at Leipzig. From 1733 to 1735 he held successively the organistships at Mühlhausen and Sangerhausen; in 1738 he threw up his appointment and went to study law at Jena; in 1739 he died, aged 24.

JOHANN CHRISTOPH FRIEDRICH BACH (1732-1795), the ninth son, was born at Leipzig, studied at the Thomasschule and the university, and in 1750 was appointed Kapellmeister at Bückeburg. He was an industrious composer, especially of church-music and opera, whose work reflects no discredit on the family name.

JOHANN CHRISTIAN BACH (1735-1782), the eleventh son, was born at Leipzig, and on the death of his father in 1750 became the pupil of his brother Emanuel at Berlin. In 1754 he went to Italy where he studied under Padre Martini, and from 1760 to 1762 held the post of organist at Milan cathedral, for which he wrote two Masses, a Requiem, a Te Deum and other works. Having also gained some reputation as a composer of opera, he was in 1765 invited to London and there spent the rest of his life. For twenty years he was the most popular musician in England, his dramatic works, produced at the King's theatre, were received with great cordiality, he was appointed music-master to the queen, and his concerts, given in partnership with Abel at the Hanover Square rooms, soon became the most fashionable of public entertainments. He is of some historical interest as the first composer who preferred the pianoforte to the older keyed-instruments; but his works, though elegant and pleasing, were ephemeral in character and have been deservedly forgotten.

A full account of J. C. Bach's career is given in the fourth volume of Burney's History of Music, and a catalogue of his compositions in an article by Max Schwarz, published in the Sammelbande der Internationale Musik-Gesellschaft, Hrg. ii. p. 401. (W. H. H.A.)

BACHARACH, YAIR (1639-1702), German rabbi, was the author of Havwoth Yair (a collection of Responsa) and other works. Bacharach was a man of wide culture, and holds an honourable place among the pioneers of the Jewish Renaissance which was inaugurated towards the end of the 18th century.

BACHARACH, a town of Germany, in the Prussian Rhine Province, romantically situated on the left bank of the Rhine, 30 m. above Coblenz on the railway to Mainz. Pop. 2000. There is an interesting church, a basilica, dating from the beginning of the 13th century. There are also ruins of a Gothic church of the 13th and 14th centuries. The ruined castle of Stahleck, crowning the heights above the town, is celebrated in history as the scene of the marriage between Henry, eldest son of Henry the Lion (shortly before the latter's death in 1195) and Agnes of Hohenstaufen, which effected a temporary reconciliation between the houses of Welf and Hohenstaufen. Other ruined castles are those of Fürstenberg and Stahlberg. All three belonged to the counts palatine. The wines of Bacharach were once held in the greatest esteem, and it is still one of the chief markets of the Rhenish wine trade.

BACHAUMONT, LOUIS PETIT DE (1660-1771), French littérateur, was of noble family and was brought up at the court of Versailles. He passed his whole life in Paris as the centre of the salon of Madame Doublé de Persan (1677-1771), where criticism of art and literature took the form of malicious gossip. A sort of register of news was kept in a journal of the salon, which dealt largely in scandals and contained accounts of books suppressed by the censor. Bachaumont's name is commonly connected with the first volumes of this register, which was published anonymously under the title Mémoires secrets pour servir à l'histoire de la République des Lettres, but his exact share in the authorship is a matter of controversy. It was continued by Pidansat de Mairobert (1707-1779) and others, until it reached 36 volumes (1744-1779). It is of some value as a historical source, especially for prohibited literature. Extracts were published by P. Lacroix in one volume, 1859. An incomplete edition (4 vols.) was undertaken in 1830 by Ravenal.

See, in addition to the memoirs of the time, especially the Correspondance littéraire of Grimm, Diderot, d'Alembert and others (new ed., Paris, 1878, 17 vols.); Ch. Aubertin, L'Esprit public au XVIIIe siècle (Paris, 1872).

BACHE, ALEXANDER DALLAS (1806-1867), American physician, great-grandson of Benjamin Franklin, was born at Philadelphia on the 19th of July 1806. After graduating at the United States Military Academy at West Point in 1825, he acted as assistant professor there for some time, and as a lieutenant in the corps of engineers he was engaged for a year or two in the erection of coast fortifications. He occupied the post of professor of natural philosophy and chemistry in the University of Pennsylvania in 1828-1841 and in 1842-1843. For the trustees of what in 1848 was to become Girard College, but had not yet been opened, he spent the years 1836-1838 in Europe, examining European systems of education, and on his return published a very valuable report. In 1843, on the death of Professor F. R. Hassler (1770-1843), he was appointed
superintendent of the United States coast survey. He succeeded in impressing Congress with a sense of the great value of this work, and by means of the liberal aid it granted, he carried out a singularly comprehensive plan with great ability and most satisfactory results. By a skilful division of labour, and by the erection of numerous observing stations, the mapping out of the whole coast proceeded simultaneously under the eye of the general director, and in addition a vast mass of magnetic and meteorological observations was collected. He died at Newport, Rhode Island, on the 17th of February 1867.

BACHE, FRANCIS EDWARD (1833-1888), English musical composer, was born in Birmingham on the 14th of September 1833. The pupil of Alfred Mellon for violin and Sterndale Bennett for composition, he afterwards went to Leipzig in 1853 and studied with Hauptmann and Pahidy. Considering the early age at which he died, his compositions are fairly numerous, and the best, a trio for piano and strings, is still held in high esteem. Two operettas, a piano concerto and a number of published pianoforte pieces and songs do little more than show how great was his promise. He died at Birmingham of consumption on the 24th of August 1858. His younger brother, Walter Bache (1842-1893), was born in Birmingham on the 10th of September 1842 and was sent to the Leipzig Conservatorium, where he became an excellent pianist. From 1862 to 1865 he studied with Liszt in Rome, and for many years devoted himself to the task of winning popularity for his master's works in England. At his annual concerts in London nearly all Liszt's larger works were heard for the first time in England, and on the occasion of Liszt's last visit to England in 1886, he was entertained by Bache at a memorable reception at the Grosvenor Gallery. Walter Bache was professor of the pianoforte at the Royal Academy of Music for some years before his death, and the foundation of the Liszt scholarship at that institution was mainly due to his efforts. He died in London on the 26th of March 1888.

An interesting memoir of the two brothers, by Miss Constance Bache, appeared in 1901 under the title Brother Musicians.

BACHELOR (from Med. Lat. baccalarius, with its late and rare variant baccalarii—cf. Ital. baccalore—through O. Fr. bacheler), in the most general sense of the word, a young man. The word, however, as it possesses several widely distinct applications, has passed through various changes and its origin is still surrounded with a certain amount of obscurity. The derivation from Welsh bach, little, is mentioned as "possible" by Skeat (Etymological Dictionary), but is "definitely discarded" by the New English Dictionary, and that given here is suggested as probable. The word baccalarius was applied to the tenant of a baccaloria (from baccala, a herd of cows, bacco being a Low Latin variant of vacca), which was presumably at first a grazing farm and was practically the same as a vasellaria, i.e. the fief of a sub-vassal.

Just, however, as the character and the size of the baccaloria varied in different ages, so the word baccalarius changed its significance; thus in the 8th century it was applied to the rustici, whether men or women (baccalarioi), who worked for the tenant of a manors. Throughout all its meanings the word has retained the idea of subordination suggested in this origin. Thus it came to be applied to various categories of persons as follows.—

(1) Ecclesiastics of an inferior grade, e.g. young monks or even recently appointed canons (Severtius, de episcopis Lugdunensis, p. 277, in Du Cange). (2) Those belonging to the lowest stage of knighthood. Knights bachelors were neither free vassals who could not afford to take the field under their own banner, nor knights too young to support the responsibility and dignity of knights bannerets (see Knighthood and Chivalry). (3) Those holding the preliminary degree of a university, enabling them to proceed to that of master (magister) which alone entitled them to teach. In this sense the word baccalarius or baccalureus first appears at the university of Paris in the 13th century, in the system of degrees established under the auspices of Pope Gregory IX., as applied to scholars still in statu pupillari. Thus there were two classes of baccalarii: the baccalarii cursores, i.e. theological candidates passed for admission to the divinity course, and the baccalarii dispositi, who, having completed this course, were entitled to proceed to the higher degrees. In modern universities the significance of the degree of bachelor, in relation to the others, varies, e.g. at Oxford and Cambridge the bachelor can proceed to his mastership by simply retaining his name on the books and paying certain fees; at other universities a further examination is still necessary. But in no case is the bachelor a full member of the university. The degree of bachelor (of arts, &c.) is borne by women also. (4) The younger or inferior members of a trade guild or city company, otherwise known as "yeomen" (now obsolete). (5) Unmarried men, since these presumably have their fortunes yet to make and are not full citizens. The word bachelor, now confined to men in this connotation, was formerly sometimes used of women also.

Bachelors, in the sense of unmarried men, have in many countries been subjected to penal laws. At Sparta, citizens who remained unmarried after a certain age suffered various penalties. They were not allowed to witness the gymnastic exercises of the maidens; and during winter they were compelled to march naked round the market-place, singing a song composed against themselves and expressing the justice of their punishment. The usual respect of the young to the old was not paid to bachelors (Plut., Lyg. 15). At Athens there was no definite legislation on the matter; but certain regulations are similar in spirit akin to the Spartan doctrine (see Schömann, Gr. Alterth. i. 548). At Rome, though there appear traces of some earlier legislation in the matter, the first clearly known law is that called the Lex Julia, passed about 18 B.C. It does not appear to have ever come into full operation; and in a.d. 9 it was incorporated with the Lex Papia et Poppea, the two laws being frequently cited as one, Lex Julia et Papia Poppea. This law, while restricting marriages between the several classes of the people, laid heavy penalties on unmarried persons, gave certain privileges to those citizens who had several children, and finally imposed lighter penalties on married persons who were childless. Isolated instances of such penalties occur during the middle ages, e.g. by a charter of liberties granted by Matilda I., countess of Nevers, to Auxerre in 1223, an annual tax of five solidi is imposed on any man qui non habet uxorem et est bache- larius. In Britain there has been no direct legislation bearing on bachelors; but, occasionally, taxes have been made to bear upon them rather than on others. Instances of this are the act (6 and 7 Will. III.) of 1695; the tax on servants, 1783; and the income tax, 1798.

BACHIAN (Dutch Batjan), one of the Molucca Islands, in the residency of Ternate, Dutch East Indies, in the Molucca Sea, in o°13'-o°55' S. and 127°22'-128°E. With its subordinate islands, Mandioli, Tawali and others, it lies west of the southern peninsula of the island of Halmahera or Jilolo, and has an area of 914 sq. m. It is of irregular form, consisting of two distinct mountainous parts, united by a low isthmus, which a slight subsidence would submerge. The island is in part of volcanic formation, and the existence of hot springs points to volcanic activity. There are, however, especially in the southern portion, ancient and non-volcanic rocks. The highest elevation occurs at the south of the island, the mountain of Labua reaching 6950 ft. Coal and other minerals have been discovered. A large portion of the island is richly wooded, and sago, cocoa-nuts and cloves (which are indigenous) are abundantly produced. Bachian is remarkable as the most eastern point on the globe inhabited by any of the Quadrimum, a black ape occurring here as in Celebes. The island is very rich in birds and insects. The interior of the island is uninhabited and none of the dwellers on the coast are indigenous. They consist of the Sirani or Christian descendants of the Portuguese, of Malays, with a Papuan element, Galea men from the north of Halmahera, immigrants from Celebes, with some Chinese and Arabs. The total number of inhabitants is about 13,000. The chief village, called Amasing by the inhabitants, but also called Bachian, is situated on the west side of the isthmus. Bachian is the most important island of a group formerly governed by a sultan, but since 1889 by a committee of chiefs under the control of a Dutch controleur. From 1882 onwards a Batjan company attempted to exploit the island, but
unsuccessfully, owing to a deficient knowledge of the soil and its capabilities and a lack of labourers.

BACK-BOND, or BACK-BOND, in Scots law, a deed qualifying the terms of another deed, or declaratory of the purposes for which another deed has been granted. Thus an ex facie absolute disposition, qualified by a back-bond expressing the limited nature of the right actually held by the person to whom the disposition is made, would constitute what in England is termed a deed of trust.

BACK-CHOIR, RETRO-CHOIR, a space behind the high altar in the choir of a church, in which there is, or was, a small altar standing back to back with the other.

BACKERGUNJE, or BAKARGANJ, a district of British India in the Dacca division of Eastern Bengal and Assam. It forms part of the joint delta of the Ganges and the Brahmaputra, and its area is 4,542 sq. m. The general aspect of the district is that of a flat even country, dotted with clusters of bamboos and betel-nut trees, and intersected by a perfect network of dark-coloured and sluggish streams. There is not a hill or hillock in the whole district, but it derives a certain picturesque beauty from its wide expanses of cultivation, and the greenness and freshness of the vegetation. This is especially conspicuous in the rains, but at no time of the year does the district present a drier or burnt-up appearance. The villages, which are always walled round by groves of bamboos and betel-nut palms, have often a very striking appearance; and Backergunj has many names of detail striking a traveller in passing through the country.

The level of the country is low, forming as it does a part of the great Gangetic delta; and the rivers, streams and water-courses are so numerous that it is very difficult to travel except by boat at any season of the year. Every natural hollow is full of water, around the margin of which long grasses, reeds and other aquatic plants grow in the greatest profusion, often making it difficult to say where the land ends and the water begins. Towards the north-west the country is very marshy and nothing is to be seen for miles but tracts of unreclaimed swamps and rice lands, with a few huts scattered here and there and raised on mounds of earth. In the south of the district, along the coast of the Bay of Bengal, lie the forest tracts of the Sundarbans, the habitation of tigers, leopards and other wild beasts.

The principal rivers of the district are the Meghna, the Arial Khan and the Haringhata or Baleswar, with their numerous offshoots. The Meghna represents the accumulated waters of the Brahmaputra and Ganges. It flows along the eastern boundary of the district in a southerly direction for about 100 m. till it debouches into the Bay of Bengal. During the latter part of its course it divides into a large estuary containing many islands, the principal of which is that of Dakshin Shabazpur. The islands on the sea-front are exposed to devastation by cyclonic storm-waves. The Arial Khan, a branch of the Ganges, enters the district from the north, and flows generally in a south-easterly direction till it falls into the estuary of the Meghna. The main channel of the Arial Khan is about 1700 yds. in width in the dry season, and from 2000 to 3000 yds. in the rains. It receives a number of tributaries, sends off several offshoots, and is navigable throughout the year by native cargo boats of the largest size. The Haringhata, Baleswar, Madhumati and Garai are various local names for the same river in different parts of its course and represent another great offshoot of the Ganges. It enters Backergunj near the north-west corner of the district, whence it forms its western boundary, and runs south, but with great windings in its upper reaches, till it crosses the Sundarbans, and finally falls into the Bay of Bengal by a large and deep estuary, capable of receiving ships of considerable burden. In the whole of its course through the district the river is navigable by native boats of large tonnage, and by large sea-going ships as high up as Morrelganj, in the neighbouring district of Jessore. Among its many tributaries in Backergunj the most important is the Kacha, itself a considerable stream and navigable by large boats all the year round, which flows in a southerly direction for 20 m., when it falls into the Baleswar. Other rivers of minor importance are the Barisal, Bishkhali, Nihalganj, Khairabad, Ghagar, Kumar, &c.

All the rivers in the district are subject to tidal action from the Meghna on the north, and from the Bay of Bengal on the south, and nearly all of them are navigable at high tide by country boats of all sizes. The rise of the tide is very considerable in the estuary of the Meghna, and many of the creeks and water-courses in the island of Dakshin Shabazpur, which are almost dry at ebb tide, contain 18 or 19 ft. of water at the flood. A very strong " bore " or tidal wave runs up the estuary of the Meghna at spring tides, and a singular sound like thunder, known as the " Barisal guns," is often heard far out at sea about the time it is coming in. There are numerous marshes in the district, of great size and depth, and abounding in fish.

The Mussulmans of Backergunj are among the worst of their creed, steeped in ignorance and prejudice, easily excited to violence and murder, very litigious and grossly immoral. On account of an epidemic of murders disarmament had to be enforced in the district. The Farazis or Puritan sect of Mahomedans are exceedingly numerous in the district. The Buddhist population consists of Maghs or the people of Arakan, who first settled in Backergunj about 1800, and have made themselves very useful in the clearing of the Sundarbans. A gipsy-like tribe called the Bebajjas are rather numerous in this district. They live principally in boats, travelling from place to place, profess Mahomedanism, and gain their subsistence by wood-cutting in the Sundarbans, fishing, fortune-telling and trading in trinkets. In 1901 the population was 2,971,752, showing an increase of 6% in the decade.

A number of small trading villages exist throughout the district, and each locality has its periodical fairs for purposes of traffic. The material condition of the people is good. Every inhabitant is a small landholder and cultivates sufficient rice and other necessaries for the support of his family. Owing to this reason, hired labour is very scarce. Rice is the great crop of the district, and three harvests are obtained annually—the aman, or winter rice; aus, or autumn crop; andboro, or spring rice. The climate of Backergunj is one of the healthiest in Eastern Bengal, owing to the strong south-west monsoon, which comes up directly from the Bay of Bengal, and keeps the atmosphere cool; but the heavy rainfall and consequent humidity of the atmosphere, combined with the use of bad water, are fruitful sources of disease. The average annual temperature varies from 78° to 85° F. The thermometer ranges from 62° to 98°.

Barisal, the headquarters station, situated on the west bank of the Barisal river, had a population in 1901 of 18,978. The nearest large town is Pirojpur (14,110).

BACKERMANN, the name of a family of German merchants and a special board, depending on the throw of the dice. It is said to have been invented about the 18th century (Strutt). A similar game (Ludus duodecim scriptorum, the "twelve-line game") was known to the Romans, and Plato (Republ., bk. x.) alludes to a game in which dice were thrown and men were placed after due consideration. The etymology of the word "backgammon" is disputed; it is probably Saxon—bace, back, gamen, game; i.e. a game in which the players are liable to be sent back. Other derivations are, Dan. bække, tray, gammen, game (Wedgwood); and Welsh bach, little, commann, battle (Henry). Chaucer alludes to a game of " tables," played with three dice, in which "men " were moved from the opponent's " tables," the game (ludus Anglicorum) being described in the Harleian MSS. (1527). The French name for backgammon is trictrac, imitative of the rattle of the dice.

Backgammon is played by two persons. The "board" (see diagram) is divided into four "tables," each table being marked with six "points" coloured differently. The inner and outer tables are separated from each other by a projecting bar. The board (in the ordinary form of the game) is furnished with fifteen white and fifteen black men, etc., or arranged as in the diagram. It is usual to make the inner table the one nearest to the right.

Two dice-boxes are required, one for each player, and a pair of dice, which are used by both players. The dice are marked with numbers on their six sides, from one to six, number one being called, "ace," two, "deuce"; three, "trey." Formerly the
BACKGAMMON

four was called “quatre” (pronounced “cater”); the five, “cinque” (pronounced either “sank” or “sink”); and the six, “six” (size).

For the right to start each player throws one or two dice; the one who throws the higher number has the right of playing first; and he may either adopt the numbers thrown or he may throw again, using both dice.

The men are moved on from point to point, according to the throws of the dice made by the players alternately. White moves from black’s inner table to black’s outer, and from this to white’s outer table; and all black’s moves must be in the contrary direction. A player may move any of his men a number of points corresponding to the numbers thrown by him, provided the point to which the move would bring him is not blocked by two or more of his adversary’s men being on it. The whole throw may be taken with one man, or two men may be moved one the exact number of points on one die, the other the number on the other die. If doublets are thrown (e.g. two sixes), four moves of that number (e.g. four moves of six points) may be made, either by all one man or separately by more. Thus,

1. Black’s ace-point. 2. White’s ace-point. 4. White’s bar-point. 4. White’s bar-point.

In carrying the men home carry the most distant man to your adversary’s bar-point, to the six-point in your outer table, and then to the six-point in your inner table. By following this rule as nearly as possible, the player who first gets all his men off the board wins the game.

When six is empty, if six is thrown a man may be borne from five and so on. If, after a player has commenced throwing off his men, he should be hit on a blot, he must enter on his adversary’s inner table and must bring the man taken up into his own inner table before he can bear further.

Whoever first takes off all his men wins the game—a single game (a “hit”) if his adversary has begun bearing; a double game (a “gammon”) if the adversary has not borne a man; and a triple game (a “backgammon”) if, at the time the winner bears his last man, his adversary, not having borne a man, has one in the winner’s inner table, or has a man up. When a series of games is played, the winner of a hit has the first throw in the succeeding game; but if a gammon is won, the players each throw a single die to determine the first move of the next game.

In order to play backgammon well, it is necessary to know all the chances on two dice and to apply them in various ways. The number of different throws that can be made is thirty-six. By the combination of these rows which include given numbers, it is easily discovered where blots may be left with the least probability of being hit. For example, to find the chance of being hit where a blot can only be taken up by an ace, the adversary may throw two aces, any number in combination with any other number up to six, and he may throw each of these in two different ways, so that there are in all eleven ways in which an ace may be thrown. This, deducted from thirty-six (the total number of throws), leaves twenty-five; so that it is 25 to 1 that an ace may be hit on any move. It is very important to bear in mind the chance of being hit on any number. The following table gives the odds against being hit on any number within the reach of one or two dice:

<table>
<thead>
<tr>
<th>Number</th>
<th>Odds</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>25 to 1</td>
</tr>
<tr>
<td>2</td>
<td>132 to 1</td>
</tr>
<tr>
<td>3</td>
<td>121 to 1</td>
</tr>
<tr>
<td>4</td>
<td>52 to 1</td>
</tr>
<tr>
<td>5</td>
<td>15 to 1</td>

<tr>
<td>11</td>
<td>1 to 1</td>
</tr>
<tr>
<td>12</td>
<td>1 to 1</td>
</tr>
</tbody>
</table>

The table shows that if a blot must be left within the reach of one die, the nearer it is to the adversary’s men the less probability there is of its being hit. Also, that it is long odds against being hit on a blot which is only to be reached with double dice, and that, in that case (on any number from 7 to 11), the farther off the blot, the less chance it has of being hit. The table assumes that the board is open for every possible throw. If part of the throw is blocked by an intervening point being held by adverse men, the chance of being hit is less.

The principles for deciding the move in moving the men are:

1. To make moves where there is the best chance of obstructing the opponent.
2. When obliged to leave blots, to choose the position in which they are least likely to be hit.
3. To leave no blot points secure in your own inner table and the five-point in your adversary’s inner table.
4. To leave the best own bar-point; and the next best the four in your own inner table.

When you have any moves at the commencement of a game as follows:—Aces (the best of all throws), move two on your bar-point and two on your five-point. This throw is often given to inferior players by way of odds.

Ace, trey: make the five-point in your own inner table.

Ace, six: make your bar-point.

Deuces: move two on the four-point in your inner table, and two on the trey-point in your opponent’s inner table.

Threes: play two on the five-point in your inner table, and two on the four-point of your adversary’s inner table, or make your bar-point.

Trey, five: make the trey-point in your own table.

Trey, six: bring a man from your adversary’s ace-point as far as he will go.

Fours: move two on the five-point in your adversary’s inner table, and two from the five in his outer table.

Four, five and four, six, carry a man from your adversary’s ace-point as far as he will go.

Fives: move two men from the five in your adversary’s outer table to the trey-point in your inner table.

Sixes (the second-best throw): move two on your adversary’s bar-point and two on your own bar-point.

In carrying the men home carry the most distant man to your adversary’s bar-point, to the six-point in your outer table, and then to the six-point in your inner table.
as the throws admit, you will carry the men to your inner table in the fewest number of throws.

Avoid carrying many men upon the trey or deuce-point in your own tables, as these men are out of play.

Whenever you have taken up two of your adversary’s men, and two or more points in your outer table, spread your other men in the hope of making another point in your tables, and of hitting the man your adversary enters.

Always take up a man if the blot you leave in making the move can enter the opposite trey or deuce, but if you already have two of your opponent’s men in your table it is unwise to take up a third.

In entering a man which it is to your adversary’s advantage to hit, leave the blot upon the lowest point you can, e.g. ace-point in preference to deuce-point.

When your adversary is bearing his men, and you have two men in his table, say, on his ace-point, and several men in the outer table, it is to your advantage to leave one man on the ace-point, because it prevents his bearing his men to advantage, or you can change his design by covering him with a blot. But if you find that you can probably save the gammon by bringing both your men out of the table, do not wait for a blot. Eight points is the average throw.

The laws of backgammon (as given by Boyle) are as follows:

When any man is touched by the caster it must be played if possible; if impossible no penalty. 2. A man is not played till it is placed upon a point and quitted. 3. If a player omits a man from the board there is no penalty. 4. If he bears any number of men in a man-thrower, the man-thrower is entered again. 5. If he has missed his throw and played it, and his adversary has thrown, it is not in the choice of either of the players to alter it, unless they both agree to do so. 6. If one or both do not enter the man, i.e. do not lie fairly and squarely on the table, a fresh throw is imperative.

**Backgammon** varies from the above game in that the men, instead of being set as in the diagram, are entered in the same table by throws of the dice, and both players move in the same direction round to the opposite table. There are various rules for this game. By some a player is not obliged to enter all his men before he moves any; he can take up blots at any time on entering, while he has a man up, he must enter it before entering any more or moving any of those already entered. If he cannot enter the man that is up, he loses the benefit of the throw.

A player who throws doublets must play or enter not only the number thrown, but also doublets of the number corresponding to the opposite side of the dice; thus, if he throws sixes, he must first enter or move the sixes, as the case may be, and then aces, and he also has another throw. Some rules allow him to play either doublets first, but he must always complete one set before playing the other. If a player cannot play the whole of his throw, his adversary is sometimes allowed to play the unplayed portion, in which cases the caster is sometimes allowed to come in and complete his moves, if he can, and in the event of his having thrown deuce-ace or doublets to throw again. If he throws doublets a second time, he moves and throws again, and so on. The privilege is sometimes restricted by not allowing this advantage to the first doublets thrown by either player. It is sometimes extended by allowing the thrower of the deuce-ace to choose the doublets he likes on the opposite side of the dice, and to throw again. The restriction with regard to the first doublets thrown does not apply to deuce-ace, nor does throwing it remove the restriction with regard to first doublets. A player must first be able to complete the doublets thrown. If the player cannot move the whole throw he cannot take the corresponding doublets, and he is not allowed another throw if he cannot move all the points to which he is entitled.

**Backhuysen** or **Backhuysen, Ludolf** (1631–1708), Dutch painter, was born at Emden, in Hanover. He was brought up as a merchant at Amsterdam, but early discovered so strong a genius for painting that he relinquished business and devoted himself to art. He studied first under Allart van Everdingen and then under Hendrik Dubbels, two eminent masters of the time, and soon became celebrated for his sea-pieces. He was an ardent student of nature, and frequently exposed himself on the sea in an open boat in order to study the effects of tempests. His compositions, which are very numerous, are nearly all variations of one subject, and in a style peculiarly his own, marked by intense realism or faithful imitation of nature. In his later years Backhuysen employed his time in etching and calligraphy. He died in Amsterdam on the 17th of November 1708.

**Backnang**, a town of Germany, in the kingdom of Württemberg, 19 m. by rail N.E. from Stuttgart. Pop. (1900) 7650. It has an interesting church, dating from the 12th century, and a large number of ancient towers and mills.

In 1325 Backnang was ceded to Württemberg by Baden. In the vicinity is the Wilhelmshaus sanatorium for consumptives.

**Backscratcher**, a long slender rod of wood, whalebone, tortoiseshell, horn or cane, with a carved human hand, usually of ivory, mounted at the extremity. Its name suggests the primary use of the implement, but little is known of its history, and it was unquestionably also employed as a kind of rake to keep in order the huge "heads" of powdered hair worn by ladies during a considerable portion of the 18th and the early part of the 19th centuries. The backscratcher varies in length from 12 to 20 in., and the more elaborate examples, which were occasionally hung from the waist, are silver-mounted, and in rare instances the ivory fingers bear carved rings. The hand is sometimes outstretched, and sometimes the fingers are flexed; the modelling is frequently good, the fingers delicately formed and the nails well defined. As a rule the rod is finished off with a knob. The hand was now and again replaced by a rake or a bird’s claw. The hand was indifferently dexter or sinister, but the Chinese variety usually bears a right hand. Like most of the obsolete appliances of daily life, the backscratcher, or scratch-back, as it is sometimes called, has become scarce, and it is one of the innumerable objects which are the subjects of the antiques trade.

**Back’s River** (Thlewechodyth, or “Great Fish”), a river in Mackenzie and Keewatin districts, Canada, rising in Sussex lake, a small body of water in 108° 20' W. and 64° 25' N., and flowing with a very tortuous course N.E. to an inlet of the Arctic Ocean, passing through several large lake-expansions—Pelly, Garry, Mac Dougall and Franklin. Like the Coppermine, the only other large river of this part of Canada, it is rendered un navigable by a succession of rapids and rocks. It was discovered and explored by Sir George Back in 1834. Its total length is 506 m.

**Backwardation**, or, as it is more often called for brevity, Back, a technical term employed on the London Stock Exchange to express the amount charged for the loan of stock from one account to the other, and paid to the buyer by the seller on a bear account (see Account) in order to allow the seller to defer the delivery of the stock. The seller, having sold for delivery on a certain date, stocks or shares which probably he does not possess, in the hope that he may be able, before the day fixed for delivery, to buy them at a cheaper price and so earn a profit, finds on settling-day that the prices have not gone down according to his expectation, and therefore pays the purchaser an agreed amount of interest (backwardation) for the privilege of deferring the delivery, either in order to procure the stock, or else in the hope that there will be a shrinkage in the price which will enable him to gain a profit. (See also Stock Exchange).

**Bacon, Francis** (Baron Verulam, Viscount St Albans) (1561–1626), English philosopher, statesman and essayist, was born at York House in the Strand, London, on the 22nd of January 1560/1. He was the youngest son of Sir Nicholas Bacon (q.v.). His mother, the second wife of Sir Nicholas, was a daughter of Sir Anthony Cooke, formerly tutor to Edward VI. She was a woman of considerable culture, well skilled in the classical studies of the period, and a warm adherent of the Reformed or Puritan Church. Very little is known of Bacon’s early life and education. His health being then, as always, extremely delicate, he probably received much of his instruction at home. In April 1573 he was entered at Trinity College, Cambridge, where for three years he resided with his brother Anthony. At Cambridge he applied himself diligently to the several sciences as then taught, and came to the conclusion that the methods employed and the results attained were alike erroneous. Although he preserved a reverence for Aristotle (of whom, however, he seems to have known but little), he learned to despise the current Aristotelian philosophy. It yielded no fruit, was peculiarly detestable to disputation, and the end it proposed to itself was a mistaken one. Philosophy must be taught its true purpose, and for this purpose a new method must be devised. With the
BACON, FRANCIS

first germ of this great conception in his mind, Bacon left the university.

On the 27th of June 1576 he and his brother Anthony were entered de sodalitate magistrorum at Gray's Inn, and a few months later he was sent abroad with Sir Amyas Paulet, the English ambassador at Paris. The disturbed state of government and society in France at that time afforded him valuable political instruction. It was formerly supposed that certain Notes on the State of Christendom, usually printed in his works, contain the results of his observations, but Spedding has shown that there is no reason for ascribing these Notes to him, and that they may be attributed with more probability to one of his brother Anthony's correspondents.

The sudden death of his father in February 1578/9 necessitated Bacon's return to England, and exercised a very serious influence on his fortunes. A considerable sum of money had been laid up by Sir Nicholas for the purchase of an estate for his youngest son, the only one otherwise unprovided for. Owing to his sudden death, this intention was not carried out, and a fifth only of the money descended to Francis. This was one of the gravest misfortunes of his life; he started with insufficient means, acquired a habit of borrowing and was never afterwards out of debt. As it had become necessary that he should adopt some profession, he selected that of law, and took up his residence at Gray's Inn in 1579.

In the fragment De Interpretatione Naturae Procumum (written probably about 1603) Bacon analyses his own mental character and lays before us the objects he had in view when he entered on public life. If his opening sentence, "Ego cum me ad utilitates humanas naturam existimarem," ("since I thought myself born to be of advantage to mankind"), seems at first sight a little arrogant, it must be remembered that it is the arrogance of Aristotle's μεγαλοφυσι,2 who thinks himself worthy of great things, and is worthy. The ideal of production good to the human race through the discovery of truth, was combined in him with the practical desire to be of service to his country. He purposed, therefore, to obtain, if possible, some honourable post in the state which would give him the means of realizing these projects, and would enable him to do somewhat for the church, the third of the objects whose good he had at heart. The constant striving after these three ends is the key to Bacon's life. His qualifications for accomplishing the task were not small. His intellect was far-seeing and acute, quick and yet cautious, meditative, methodical and free from prejudice. If we add to this account that he seems to have been of an unusually amiable disposition, we have a fairly complete picture of his mental character at this critical period of his life.

In 1588 he appears to have taken the first step in his career by applying, through his uncle, Burghley, the lord treasurer, for some post at court. His suit, though well received by the queen, was unsuccessful; the particulars are totally unknown. For two years after this disappointment he worked quietly at Gray's Inn, and in 1589 was admitted an outer barrister. In 1584 he took his seat in parliament for Melcombe in Dorsetshire, but the notes for the sessions do not discourse of his acquirements. About this time he made another application to Burghley, apparently with a view to expediting his progress at the bar. His uncle, who appears to have "taken his zeal for ambition," wrote him a severe letter, taking him to task for arrogance and pride, qualities which Bacon vehemently disclaimed. As his advancement at the bar was unusually rapid, his uncle's influence may have been exerted in his behalf. In 1589 he received the first substantial piece of patronage from his powerful kinsman, the reversion of the clerkship of the Star Chamber. The office was worth £600 a year; but it did not become vacant for nearly twenty years. A considerable period of his life thus slipped away, and his affairs had not prospered. He had written on the condition of parties in the church; he had set down his thoughts on philosophical reform in the lost tract, Temporis Partus Maximus; but he had failed in obtaining the position which he looked upon as an indispensable condition of success. A long and eloquent letter to Burghley2 throws additional light upon his character, and gives a hint as to the cause of his uncle's slowness in promoting him.

Some time before this, perhaps as early as 1588, Bacon appears to have become acquainted with the earl of Essex, Elizabeth's favourite. At the close of 1591 he was acting as the earl's confidential adviser, and exerted himself, together with his brother Anthony, diligently in the earl's service. In February 1593 parliament was called, and Bacon took his seat for Middlesex. The special occasion for which the House had been summoned was the discovery of one of the numerous popish plots that distracted Elizabeth's reign.

As Bacon's conduct in this emergency seriously affected his fortunes and has been much misunderstood, it is necessary to state, as briefly as possible, the whole facts of the case. The House having been duly informed of the state necessities, assented to a double subsidy and appointed a committee to draw up the requisite articles. Before this was completed, a message arrived from the House of Lords requesting a conference, which was granted. The committee of the Commons were then informed that the crisis demanded that the subsidy be collected in a shorter time than usual, that the Lords should not contribute less than this, and that they desired to confer on the matter. This proposal of the Lords to discuss supply infringed upon the privileges of the Commons; accordingly, when the report of committee was read to the Lower House, Bacon spoke against the proposed conference, pointing out at the same time that a communication from the Lords might be received, but that the actual deliberation on it must be taken by themselves alone. His motion, after some delay, was carried and the conference was rejected. The Lords upon this lowered their demands, and desired merely to make a communication, which, being legitimate, was at once assented to. The House had then before them the proposal for a triple subsidy, to be collected in three, or, as the motion ultimately was shaped, in four years, instead of in six, as the ordinary custom would have been. Bacon, who approved of the increased subsidy, was opposed to the short period in which it was proposed to raise it. He suggested that it would be difficult or impossible for the people to meet such heavy demands, that discontent and trouble would arise, and that the better method of procedure was to raise money by levy or imposition. His motion appears to have received no support, and the four years' subsidy was passed unanimously. Bacon, as it turned out, had been mistaken in thinking that the country would be unable to meet the increased taxation, and his conduct, though prompted by a pure desire to be of service to the queen, gave deep and well-nigh ineradicable offence. He was accused

1 See Nce. Eih. iv. 3. 1123b.

2 I wax now somewhat ancient; one-and-thirty years is a great deal, of soine office of gain; that is, a middle place that I could discharge) to serve her majesty; not as a man born under Sol, that loveth honour; nor under Jupiter, that loveth business (for the contemplative planet carrieth me away and gives me nothing but a man born under an excellent sovereign, that desireth the estate of the men's abilities. Amen, the goodness of my estate doth somewhat move me; for though I cannot accuse myself that I am either prodigal or slothful, yet my health is not to be hurt, nor too much of use to get. Lastly, I confess that I have as vast contemplative ends as the most industrious and industrious; but that all knowledge is to my province; and if I could purge it of two sorts of rovers, whereof the one with frivolous disputations, confutations on artifices, the other with blind experiments and auricular traditions and impositions, hath committed all, I hope I should bring in industrious observations, grounded conclusions and profitable inventions and discoveries—the best state of that province. This, whether it be curiousity, or vain-glory, or nature, or (if one take an end) philantropia, or study, yet I have nothing in my mind as it cannot be removed. And I do easily see, that place of any reasonable command ment doth bring commandment of more wits than of a man's own. And if your lordship shall find now, or at any time, that I do see any slip; or that any place to which it is not necessary, I hope, I shall be convenient, say then that I am a most dishonest man. And if your lordship will not carry me on...this I will do, I will sell the inheritance that I have, and purchase some lease of quick revenue, nor any place but that it is not necessary; and if any lordship shall be convenient, say then that I am a most dishonest man, or a true pioneer in that mine of truth."—Spedding, Letters and Life, i. 105-109.
of seeking popularity, and was for a time excluded from the court. His letter to Burghley, who had told him of the queen's displeasure with his speech, offers no apology for what he had said, and his representation that his motives should have been misunderstood. He soon felt that the queen's anger was not to be appealed by such a justification. The attorney-generalship had fallen vacant and Bacon became a candidate for the office; his most formidable rival being his life-long antagonist, Edward Coke, who was then solicitor. Essex warmly espoused Bacon's cause and earnestly pressed his claims upon the queen; but his impetuous, pettish pleading tended to retard the cause. Burghley, on the other hand, in no way promoted his nephew's interest; he would recommend him for the solicitorship, but not for the attorney-generalship; and it is not improbable that Sir Robert Cecil secretly used his influence against his cousin. The queen delayed the appointment, and Bacon's fortunes, as they then stood, could ill brook delay. He was harassed with debt and at times so disheartened that he contemplated retirement from public life. In March 1594 it was at last understood that Coke was to be attorney-general. Essex, though bitterly mortified, at once threw all his energies into the endeavor to secure Bacon's appointment; but in this cause also, his method of dealing, which was wholly opposed to Bacon's advice, seemed to irritate the queen. The old offence was not yet forgiven, and after a tedious delay, the office was given, in October 1595, to Serjeant Thomas Fleming. Burghley and Sir John Fooker see to have assisted Bacon honestly, if not overwarmly, in this second application; but the conduct of Cecil had roused suspicions which were not perhaps without foundation. Essex, to compensate in some degree for Bacon's disappointment, insisted on presenting him with a piece of land, worth about £1800, and situated probably near Twickenham Park. Nor did his kindness cease there; before sailing on the expedition to Cadiz, in the beginning of 1596, he addressed letters to Buckhurst, Fortescue and Egerton, earnestly requesting them to use their influence towards procuring for Bacon the vacant office of master of the rolls. Before anything came of this application, the Cadiz expedition had resulted in a brilliant success, and Essex became the idol of the army and the people. Bacon saw clearly that such a reputation would assuredly alienate the affections of the queen, who loved not to have a subject too powerful or too popular. He therefore addressed an eloquent and imporing letter to the earl, pointing out the dangers of his position and urging upon him what he judged to be the only safe course of action, to seek and secure the favour of the queen alone; above all things dissuading him from the appearance of military popularity. His advice, however, was unpalatable and proved ineffectual. The earl still continued his usual course of dealing with the queen, depending solely upon her supposed affection for him, and insanely jealous of any other whom she might seem to favour. His unskilful and un遛y management of the sea expedition to Ferrol and the Azores in no way lowered his popularity with the people, but undoubtedly weakened his influence with the queen.

Bacon's affairs in the meantime had not been prospering. He had increased his reputation by the publication in 1597 of his Essays, along with which were the Colour of Conscience and the Letter to the Secretary; but his private fortunes were in a bad condition. No public office apparently could be found for him; a scheme for retrieving his position by a marriage with the wealthy widow, Lady Elizabeth Hatton, failed, and in 1598 he was arrested for debt. He seems, however, to have been growing in favour with the queen. Some years previously (perhaps about 1594), he had begun to be employed by her in court affairs, and he gradually acquired the standing of one of the learned counsel, though he had no commission or warrant, and received no salary. At the same time he was no longer on the former friendly terms with Essex, a certain estrangement having sprung up between them, caused no doubt by the earl's dislike of his friend's advice. The earl's affairs were then at a somewhat critical stage, and as our judgment upon a most important episode in Bacon's life depends upon our knowledge of the events of the ensuing year, it will be requisite to enter somewhat minutely into proceedings with which Bacon himself had nothing to do.

Ireland was then in a rebellious and discontented condition, and it was difficult for the English government to decide either on a definite course of policy with regard to it, or on a leader by whom that policy might be carried out. A violent quarrel took place between the queen and Essex, who for some months retired from court and refused to be reconciled. At last he came forth from his seclusion, and it was soon understood that he was in person to undertake the subjugation of the rebels in Ireland, with a larger force than had ever before been sent into that country. Into the obscure details of this unhappy campaign it is unnecessary to enter; one fact stands out clearly, that Essex endeavoured to carry out a reasonable design. His jealousy and ill-temper had been so roused that the only course open to him was to obtain a powerful military force, the possession of which would ensure his influence with the queen. Whether or not this plan was in contemplation before he undertook the Irish expedition is not evident, though even outsiders at that time entertained some suspicions, but there can be no doubt of the reasonable character of the negotiations carried on in Ireland. His plans, probably not very definite, were disturbed by an imperative message from the queen, ordering him not to return to England without her permission. He at once set off, and, trusting apparently to her affection for him, presented himself suddenly before her. He was, for the moment, received kindly, but was soon afterwards ordered to keep his chamber, and was then given into the custody of the lord keeper at York House, where he remained till March 1600. His great popularity, and the general ignorance of the reasons for his imprisonment, stirred up a strong feeling against the queen, who was reported to be influenced by Bacon, and such indignation was raised against the latter that his friends feared his life would be in danger. It was at last felt necessary that the queen should in some way vindicate her proceedings, and this she at first did contrary to Bacon's advice, by a declaration from the Star Chamber. This, however, gave little or no satisfaction, and it was found expedient to do what Bacon had always recommended, to have a fair trial, yet not one in which the sentence must needs be damaging to the earl. The trial accordingly took place before a body of her majesty's councillors, and Bacon had a subordinate and unimportant part in the accusation. Essex does not seem to have been at all hurt by his action in this matter, and shortly after his release they were again on friendly terms, Bacon drawing up letters as if to or from the earl with the design of having them brought before the queen. But Bacon did not know the true character of the transactions in which Essex had been engaged. The latter had been released from all custody in August, but in the meantime he had been busily engaged in treasonable correspondence with James of Scotland, and was counting on the Irish army under his ally, Charles Blount, Baron Mountjoy (afterwards earl of Devonshire), the new deputy. But the earl's movements apparently came to see how useless the attempt would be to force upon the queen a settlement of the succession and declined to go farther in the matter. Essex was thus thrown upon his own resources, and his anger against the queen being roused afresh by the refusal to renew his monopoly of sweet wines, he formed the desperate project of seizing her person and compelling her to dismiss from her council his enemies Raleigh, Cobham, and Cecil. As some pretext, he intended to affirm that his life was in danger from these men, who were in league with the Spaniards. The plot was forced on prematurely by the suspicions excited at court, and the rash attempt to rouse the city of London (8th of February 1601) proved a complete fiasco. The leaders were arrested that night and thrown into prison. Although the actual rising might have appeared a mere outburst of frantic passion, the private examinations of the most prominent
conspirators disclosed to the government a plot so widely spread, and involving so many of the highest in the land, that it would have been perilous to have pressed home accusations against all who might be implicated. Essex was tried along with the young Earl of Southampton, and Bacon, as one of her majesty's counsellors, was present on the occasion. Coke, who was principal spokesman, managed the case with great want of skill, incessantly allowing the thread of the evidence to escape, and giving the prisoners opportunity to indulge in irrelevant justifications and protestations which were not ineffectual in distracting attention from the real question at issue. On the first opportunity Bacon rose and briefly pointed out that the earl's plea of having done nothing save what was absolutely necessary to defend his life from the machinations of his enemies was weak and worthless, inasmuch as these enemies were purely imaginary; and he compared his case to that of Peisistratus, who had made use of a somewhat similar stratagem to cloak his real designs upon the city of Athens. He was thereupon interrupted by the earl, who proceeded to defend himself, by declaring that in one of the letters drawn up by Bacon, and purporting to be from the earl to Anthony Bacon, the existence of these rumours, and the dangers to be apprehended from them, had been admitted; and he continued, "If these reasons were then just and true, not counterfeit, how can it be that now my pretexts are false and injurious?" This to Bacon replied, that "the letters, if they were there, would not blush to be seen for anything contained in them, and that he had spent more time in vain in studying how to make the earl a good servant to the queen than he had done in anything else." It seems to be forgotten in the general accounts of this matter, not only that Bacon's letters bear out what he said, but that the earl's excuses were false. A second time Bacon was compelled to interfere in the course of the trial, and to recall to the minds of those present the real question at issue. He animadverted strongly upon the puerile nature of the defence, and in answer to a remark by Essex, that if he had wished to stir up a rebellion he would have had a larger company with him, pointed out that his dependence was upon the people of London, and compared his attempt to that of the duke of Guise at Paris. To this the earl made little or no reply. Bacon's use of this illustration and of the former case of Peisistratus, has been much commented on, and in general it seems to have been thought that had it not been for his speeches Essex might have escaped, or, at all events, have been afterwards pardoned. But this view of the matter depends upon the supposition that Essex was guilty only of a rash outbreak. That this was not the case was well known to the queen and her council. Unfortunately, prudential motives hindered the publication of the whole evidence; the people, consequently, were still ignorant of the magnitude of the crime, and, till recently, biographers of Bacon have been in a like ignorance. The earl himself, before execution, confessed his guilt and the thorough justice of his sentence, while, with singular lack of magnanimity, he incriminated several against whom accusations had not been brought, among others his sister Lady Rich. After his execution it was thought necessary that some account should be drawn up and circulated in order to remove the prejudice against the queen's action in the matter. This was entrusted to Bacon, who drew up a Declaration of the Practices and Treasons attempted and committed by Robert, late Earl of Essex, his first draft being extensively altered and corrected by the queen and council. Nothing is known with certainty of the reception given to this official explanation, but the ill-feeling against Bacon was not wholly removed, and some years later, in 1604, he published, in the form of a letter to Mountjoy, an Apology for his action in the case. This Apology gives a most fair and temperate history of the relations between Bacon and Essex, shows how the prudent counsel of the one had been rejected by the other, and brings out very clearly what we conceive to be the true explanation of the matter. Everything that Bacon could do was done by him, until the real nature of Essex's design was made apparent, and then, as he had repeatedly told the earl, his devotion and respect were for the throne and state, not for any subject; friendship could never take rank above loyalty. Those who blame Bacon must acquit Essex of all wrong-doing.

Bacon's private fortunes, during the period after the death of Essex, were not in a flourishing condition. He had obtained a grant of £1200 from the fines imposed on Catesby, one of the conspirators, but his debts were sufficient to swallow up this and much more. And, though he was trusted by Elizabeth, and on good terms with her, he seems to have seen that he had no chance of advancement. But her death in 1603, followed by the undisputed succession of James, gave him new hopes. He used every means in his power to bring himself under James' notice, writing to all his friends at the Scottish court and to the king himself. He managed to obtain a personal interview with the king, but does not seem to have been much satisfied with it. In fact, while the king confirmed in their situations those who had held crown offices under Elizabeth, Bacon, not holding his post by warrant, was practically omitted. He was, however, continued, by special order of the king, as learned counsel extraordinary, but little or no law business appears to have been entrusted to him. He procured, through his cousin Cecil, the dignity of knighthood, which, contrary to his inclination, he received along with about 300 others, on the 23d of July 1603. Between this time and the opening of James's first parliament he was engaged in literary work, and sent to the king two pamphlets—one on the Union, the other on measures for the pacification of the church. Shortly after he published his Apology. In March 1604 parliament met, and during their short session Bacon's hands seem to have been full of work. It was a busy and stirring time, and events occurred during it which carried within them the seeds of much future dissension. Prerogative and privilege came more than once into collision, the abuses of purveyance and wardship were made matters of conference, though the thorough discussion of them was deferred to a succeeding session; while James's temper was irritated by the objections brought against his favourite scheme of the Union, and by the attitude taken up by the House with regard to religious affairs. The records are rarely full enough to enable us to judge of the share taken by Bacon in these discussions; his name generally appears as the reporter of the committees on special subjects. We can occasionally, however, discern traces of his tact and remarkable prudence; and, on the whole, his attitude, particularly with regard to the Union question, recommended him to James. He was shortly afterwards formally installed as learned counsel, receiving the salary of £40, and at the same time a pension of £60 yearly. He was also appointed one of the commission to treat of the conditions necessary for the Union; and the admirable manner in which the duties of that body were discharged must be attributed mainly to his influence and his complete mastery of the subject. During the recess he published his Advancement of Learning, dedicated to the king. He was now brought into relations with James, and his prospects began to improve. It is important for us to know what were his ideas upon government, upon parliaments, prerogative, and so forth, since a knowledge of this will clear up much that would seem inexplicable in his life. It seems quite evident that Bacon, from position, early training and, one might almost think, natural inclination, held as his ideal of government the Elizabethan system. The king was the supreme power, the centre of law and justice, and his prerogative must not be infringed. Parliament was merely a body called to consult with the king on emergencies (circa ardua regni) and to grant supplies. King and parliament together make up the state, but the former is first in nature and importance. The duty of a statesman was, therefore, to carry out the royal will in as prudent a manner as possible; he was the servant of the king, and stood or fell according to his pleasure. He was not singular in his opinions and he was undoubtedly sincere; and it is only...
by keeping them constantly in mind that he could understand his affairs with the king.

In the second parliament there was not so much scope for the exercise of his powers. The Gunpowder Plot had aroused in the Commons warmer feelings towards the king; they passed severe laws against recusants, and granted a triple subsidy. At the same time they continued the collection of the grievances concerning which they were to move. In the course of this session Bacon married Alice Barnham "the alderman's daughter, an handsome maiden, to my liking," of whom he had written some years before to his cousin Cecil. Little or nothing is known of their married life.

The third parliament was chiefly occupied with the commercial and legal questions rising out of the proposed Union, in particular, with the dispute as to the naturalization of the Post Naut. Bacon argued ably in favour of this measure, but the general feeling was against it. The House would only pass a bill abolishing hostile laws between the kingdoms; but the case of the Post Naut, being brought before the law courts, was settled as the king wished. Bacon's services were rewarded in June 1607 by the office of solicitor. Several years passed before he gained another step. Meantime, though circumstances had thrown him too much into active life, he had not forgotten his cherished project of reorganizing natural science. A survey of the ground had been made in the *Advancement*, and some short pieces not published at the time were probably written in the subsequent two or three years. Towards the close of 1607 he sent to his friends a small tract, entitled *Cogitata et Viso*, probably the first draft of what we have under that title. In 1609 he wrote the noble panegyric, *In felicem memoriam Elizabethae*, and the curiously learned and ingenious work, *De Sapientia Veterum*, and completed what seems to have been the *Redargutio Philosophorum*, or treatise on the "idols of the theatre."

In 1610 the famous fourth parliament of James met. Pre-rogative, despite Bacon's advice and efforts, clashed more than once with liberty; Salisbury's bold schemes for relieving the embarrassment caused by the reckless extravagance of the king proved abortive, and the House was dissolved in February 1611. Bacon took a considerable share in the debates, consistently upheld the prerogative, and seemed yet to possess the confidence of the Commons. The death of Salisbury, occurring soon after, opened a position in which Bacon thought his great political skill and sagacity might be more immediately available for the king's service. How far he directly offered himself for the post of secretary is uncertain, but we know that his hopes were disappointed, the king himself undertaking the duties of the office.

About the same time he made two ineffectual applications for the mastership of the wards; the first, on Salisbury's death, when it was given to Sir George Carey; the second, on the death of Carey. It is somewhat hard to understand why so little favour was shown by the king to one who had proved himself able and willing to do good service, and who, in spite of his disappointments, still continued zealously to offer advice and assistance. At last in 1613, a fair opportunity for promotion occurred. The death of Thomas Fleming made a vacancy in the chief justiciary of the king's bench, and Bacon, after some deliberation, proposed to the king that Coke should be removed from his place in the court of common pleas and transferred to the king's bench. He gives several reasons for this in his letter to the king, but in all probability his chief motive was that pointed out by Speedling, that in the court of king's bench there would be less danger of Coke coming into collision with the king on questions of prerogative, in handling which Bacon was always very circumspect and tender. The vacancy caused by Coke's promotion was then filled up by Hobart, and Bacon, finally, stepped into the place of attorney-general. The fact of this advice being offered and followed in all essentials, illustrates very clearly the close relations between the king and Bacon, who had become a confidential adviser on most occasions of difficulty. That his adherence to the royal party was already noticed and commented on appears from the significant remark of Chamberlain, who, after mentioning the recent changes among the law officials, says, "There is a strong apprehension that . . . Bacon may prove the danger of the times." Further light is thrown upon Bacon's relations with James, and upon his political sympathies, by the letter to the king advocating the calling of a parliament, and by the two papers of notes on which his letter was founded. These documents, even after due weight is given to all considerations urged in their favour, seem to confirm the view already taken of Bacon's theory of government, and at the same time show that his sympathies with the royal party tended to blind him to the true character of certain courses of action, which can only be justified by a straining of political ethics. The advice he offered, in all sincerity, was most prudent and sagacious, and might have been successfully carried out by a man of Bacon's tact and skill; but it was intensely one-sided, and exhibited a curious want of appreciation of what was even then beginning to be looked on as the true relation of king, parliament and people. Unfortunately for James, he could neither adopt nor carry out Bacon's policy. The parliament which met in April 1614, in which Bacon sat for Cambridge University, and was dissolved in June, after a stormy session, was by no means in a frame of mind suitable for the king's purposes. The House was enraged at the supposed project (then much misunderstood) of the "Undertakers"; objection was taken to Bacon being elected or serving as a member while holding office as attorney-general; and, though an exception was made in his favour, it was resolved that no attorney-general should in future be eligible for a seat in parliament.

No supply was granted, and the king's necessities were increased instead of diminished. The emergency suggested to some of the bishops the idea of a voluntary contribution, which was eagerly taken up by the noblemen and crown officials. The scheme was afterwards extended so as to take in the whole kingdom, but lost something of its voluntary character, and the means taken to raise the money, which were not what Bacon would have recommended, were calculated to sit up discontent. The general expression of the nation's feeling, both of its_expectation and its disappointment, is given in a letter sent to the justices of Marlborough by a gentleman of the neighbourhood, named Oliver St John, in which he denounced the attempt to raise funds in this way as contrary to law, reason and religion, as constituting in the king personally an act of perjury, involving in the same crime those who contributed, and thereby subjecting all parties to the curses levelled by the church at such offences. St John was summoned before the Star Chamber for slander and treasonable language; and Bacon, *ex officio*, acted as public prosecutor. The sentence pronounced (a fine of £5000 and imprisonment for life) was severe; but it was not actually inflicted, and probably was not intended to be carried out, the success of the prosecution being all that was desired. St John remained a short time in prison, and was then released, after making a full apology and submission. The fine was remitted. It seems incredible that Bacon's conduct on this occasion should have been censured by his biographers. The sentence was, in fact, a statute; the law was unexceptionable; no particular sympathy was excited for the culprit; the case was not carried out; and Bacon did only what any one in his place would naturally and necessarily have done. The nature of his office involved him in several trials for treason occurring about the same time, and one of these is of interest sufficient to require a somewhat longer examination. Edmund Peacham had been

1 In October 1608 he became treasurer of Gray's Inn. The tercentenary was celebrated in 1908.
BACON, FRANCIS

committed to custody for a libel on his superior, James Montagu (1568–1618), bishop of Bath and Wells. In searching his house for certain papers, the officers came upon some loose sheets stitched together in the form of a sermon, the contents of which were of such a nature that it was judged right to lay them before the council. As it was at first suspected that the writing of this book had been prompted by some disaffected persons, Peacham was interrogated, and after he had declined to give any information, was subjected to torture. Bacon, as one of the learned counsel, was ordered by the council to take part in this examination, which was undoubtedly warranted by precedent, whatever may now be thought of it. Nothing, however, was extracted from Peacham in this way, and it was resolved to proceed against him for treason. Now, in the excited state of popular feeling at that period, the failure of government to substantiate an accusation of treason would have been a serious matter. The king, with whom the council agreed, seems therefore to have thought it desirable to obtain beforehand the opinions of the four chief judges as to whether the alleged offence amounted to treason. In this there was nothing unusual or illegal. The judges, however, refused to give their opinion on it, but James introduced a certain innovation; he proposed that the opinions of the four judges should be given separately and in private. It may be reasonably inferred that his motive for this was the suspicion, or it may be the knowledge, that Coke did not consider the matter treasonable. At all events when Coke, who as a councillor already knew the facts of the case, was consulted regarding the new proposal of the king, he at once objected to it, saying that "this particular and auricular taking of opinions" was "new and dangerous," and "not according to the custom of the realm." He at last reluctantly assented, and proposed that Bacon should consult with him, while the other law officers addressed themselves to the three puisne judges. By Bacon's directions the proposal to the three judges to give their opinions separately was made suddenly and confidently, and any scruples they might have felt were easily overcome. The first step was thus gained, and it was hoped that if "infusion" could be avoided, if the papers bearing on the case were presented to the judges quickly, and before their minds could be swayed by extraneous influence, their decision on the case would be the same as that of the king. It is clear that the extraneous influence to be feared was Coke, who, on being addressed by Bacon, again objected to giving his opinion separately, and even seemed to hope that his brother judges after they had seen the papers would withdraw their assent to giving their decisions privately. Even after the discussion of the case with Bacon, he would not give his opinion until the others had hadled in theirs. What the other judges thought is not definitely known, but Bacon appears to have been unable to put in operation the plan he had devised for swaying Coke's judgment, or if he did attempt it, he was unsuccessful, for Coke finally gave an opinion consistent with what he seems to have held at first, that the book was not treasonable, as it did not disable the king's title. Although the opinions of the judges were not made public, yet as we learn, not only from Bacon, but from a sentence in one of Carleton's letters, a rumour had got about that there was doubt as to the book being treasonable. Under these circumstances, Bacon, who feared that such a report might incite the king to attempt a similar offence, proposed to the king that a second rumour should be circulated in order to destroy the impression caused by the first. "I do think it necessary," he says, "that because we live in an age in which no counsel is kept, and that it is true there is some distrust abroad that the judges of the king's bench do doubt of the case that it should not be treason, that it be given out constantly, and yet as it were in secret, and so a fame to slide, that the doubt was only upon the publication, in that it was never published. For that (if your majesty marketh it) taketh away or at least qualifieth the danger of the example; for that will be no man's case." Bacon's conduct in this matter has been curiously misrepresented. He has been accused of torturing the prisoner, and of tampering with the judges by consulting them before the trial; nay, he is even represented as selecting this particular case to serve, for any example to terrify the disaffected, as breaking into his study and finding there a sermon never intended to be preached, which merely encouraged the people to resist tyranny. All this lavish condemnation rests on a complete misconception of the case. If any blame attaches to him, it must arise either from his endeavour to force Coke to a favourable decision, in which he was in all probability prompted by a feeling, not uncommon with him, that a matter of state policy was in danger of being sacrificed to some senseless legal quibble or precedent, or from his advice to the king that a rumour should be set afoot which was not strictly true.

Bacon's share in another great trial which came on shortly afterwards, the Overbury and Somerset case, is not of such a nature as to render it necessary to enter upon it in detail. It may be noted, however, that his letters about this time show that he had become acquainted with the king's new favourite, the brilliant Sir George Villiers, and that he stood high in the king's good graces. In the early part of 1616, when Thomas Egerton, Baron Ellesmere (1544–1677), the lord chancellor, was dangerously ill, Bacon wrote a long letter to the king, proposing himself for the office, should it fall vacant, and stating as frankly as possible of what value he considered his services would be. In answer, he appears to have received a distinct promise of the reversion of the office; but, as Ellesmere recovered, the matter stood over for a time. He proposed, however, that he should be made a privy councillor, in order to give him more weight in his almost recognized position of adviser to the king, and on the 9th of June 1616 he took the oaths and his seat at the council board.

Meanwhile, his great rival Coke, whose constant tendency to limit the prerogative by law and precedent had made him an object of particular dislike to James, had on two points come into open collision with the king's rights. The first case was an action of praemunire against the court of chancery, evidently instigated by him, but brought at the instance of certain parties whose adversaries had obtained redress in the chancellor's court after the cause had been tried in the court of king's bench. With all his learning and dignity, Coke at first refused to give his consent to try the case in the chancery, and even forcing the jury to bring in a bill against the court of chancery, and it seems fairly certain that on the technical point of law involved he was wrong. Although his motive was, in great measure, a feeling of personal dislike towards Ellesmere, yet it is not improbable that he was influenced by the desire to restrict in every possible way the jurisdiction of a court which was the direct exponent of the king's wishes. The other case, that of the commendams, was more important in itself and in the circumstances connected with it. The general question involved in a special instance was whether or not the king's prerogative included the right of granting at pleasure livings in commendam, i.e. to be enjoyed by one who was not the incumbent. Bacon, as attorney-general, delivered a speech, which has not been reported; but the king was informed that the arguments on the other side had not been limited to the special case, but had directly impugned the general prerogative right of granting livings in commendam. If there was necessity for James, as a party interested, at once to take measures to see that the decision of the judges should not be given on the general question without due consultation. He accordingly wrote to Bacon, directing him to intimate to the judges his pleasure that they should delay judgment until after discussion of the matter with himself. Bacon communicated first with Coke, who in reply desired that similar notice should be given to the other judges. This was done by Bacon, though he seems to hint that in so doing he was

1 Letters and Life, v. 104. 2 Ibid. v. 121, n. 3 Macaulay's Essay. 4 Campbell, Lives, ii. 344. 5 The mysterious crimes supposed to be concealed under the obscure details of this case have cast a shadow of vague suspicion on all who were concerned in it. The minute examination of the facts by Speeding (Letters and Life, v. 208–347) seems to show that these secret crimes exist nowhere but in the heated imaginations of romantic biographers and historians.
going a little beyond his instructions. The judges took no notice of the intimation, proceeded at once to give judgment, and sent a letter in their united names to the king announcing what they had done, and declaring that it was contrary to law and to their oath for them to pay any attention to a request that their decision should be delayed. The king was indignant at this encroach-ment, and acting partly on the advice of Bacon, held a council on the 6th of June 1616, at which the judges attended. James then entered at great length into the case, censuring the judges for the offensive form of their letter, and for not having delayed judgment upon his demand, which had been made solely because he was himself a party concerned. The judges, at the conclusion of his speech, fell on their knees, and implored pardon for the manner of their letter; but Coke attempted to justify the matter contained in it, saying that the delay required by his majesty was contrary to law. The point of law was argued by Bacon, and decided by the chancellor in favour of the king, who put the question to the judges individually, "Whether, if at any time, in a case depending before the judges, which had not been ad-ceived to concern him either in power or profit, and thereupon required to consult with them, and that they should stay pro-ceedings in the meantime, they ought not to stay accordingly? To this all gave assent except Coke, who said that "when the case should be, he would do that should be fit for a judge to do." No notice was taken by the king of this famous, though somewhat evasive, reply, but the judges were again asked what course they would take in the special case now before them. They all declared that they would not decide the matter upon general grounds affecting the prerogative, but upon special circumstances incident to the case; and with this answer they were dismissed. Bacon's conduct throughout the affair has been blamed, but apparently on wrong grounds. As attorney he was merely fulfilling his duty in obeying the command of the king; and in laying down the law on the disputed point, he was, we may be sure, speaking his own convictions. Censure might more reasonably be bestowed on him because he deliberately advised a course of action than which nothing can be conceived better calculated to strengthen the hands of an absolute monarch. This appeared to Bacon justifiable and right, because the prerogative would be defended and preserved intact. Coke certainly stands out in a better light, not so much for his answer, which was rather indefinite, and the force of which is much weakened by his assent to the second question of the king, but for the general spirit of resistance to encroachment exhibited by him. He was undeniably trouble-some to the king, and it is no matter for wonder that James resolved to remove him from a position where he could do so much harm. On the 26th June he was called before the council to answer certain charges, one of which was his conduct in the praemunire question. He acknowledged his error on that head, and made little defence. On the 30th he was suspended from council and bench, and ordered to employ his leisure in revising certain obnoxious opinions in his reports. He did not perform the task to the king's satisfaction, and a few months later he was dismissed from office.

Bacon's services to the king's cause had been most important; and as he had, at the same time, acquired great favour with Villiers, his prospects looked brighter than before. According to his custom, he strove earnestly to guide by his advice the conduct of the young favourite. His letters, in which he analyses the various relations in which such a man must stand, and prescribes the course of action suitable for each, are valuable and deserving of attention. Very striking, in view of future events, are the words in which he gives him counsel as to his dealing with judges: "By no means be you persuaded to interpose yourself by word or letter in any cause depending, or like to be depending, in any court of justice, nor suffer any man to do it where you can hinder it; and by all means disuade the king himself from it, upon the importunity of any, either of his friends or themselves. If it should prevail, it perverts justice; but if the judge be so just, and of so undaunted a courage (as he ought to be) as not to be inclined thereby, yet it always raises a taint of suspicions and prejudice behind it."

It is probable that Villiers at this time had really a sense of the duties attaching to his position, and was willing to be guided by a man of approved wisdom. It was not long before an opportunity occurred for showing his gratitude and favour. Ellesmere resigned the chancellorship on the 5th of March 1616/7, and on the 7th the great seal was bestowed upon Bacon, with the title of lord keeper. Two months later he took his seat with great pomp in the chancery court, and delivered a weighty and impressive opening discourse. He entered with great vigour on his new labours, and in less than a month he was able to report to Buckingham that he had cleared off all outstanding chancery cases. He seemed now to have reached the height of his ambition; he was the first law officer in the kingdom, the accredited minister of his sovereign, and on the best terms with the king and his favourite. His course seemed perfectly prosperous and secure, when a slight storm and ill-advised conduct revealed his eyes to the frailty of the tenure by which he held his position.

Coke was in disgrace but not in despair; there seemed to be a way whereby he could reconcile himself to Buckingham, through the marriage of his daughter, who had an ample fortune, to Sir John Villiers, brother of the marquess, who was penniless or nearly so. The match was distasteful to Lady Hatton and to her daughter; a violent quarrel was the consequence, and Bacon, who thought the proposed marriage most unsuitable, took Lady Hatton's part. His reasons for disapproval he explained to the king and Buckingham, but found to his surprise that their indignation was strongly roused against him. He received from both bitter letters of reproof; it was rumoured that he would be disgraced, and Buckingham was said to have compared his present conduct to his previous unfaithfulness to Essex. Bacon, who seems to have acted from a simple desire to do the best for Buckingham's own interests, at once changed his course, advanced the match by every means in his power, and by a humble apology appeased the indignation that had been excited against him. It had been a sharp lesson, but things seemed to go on smoothly after it, and Bacon's affairs prospered.

On the 4th of January 1617/8 he received the higher title of lord chancellor; in July of the same year he was made Baron Verulam and in January 1620/1 he was created Viscount St. Albans. His fame, too, had been increased by the publication in 1620 of his most celebrated work, the Novum Organum. He seemed at length to have made satisfactory progress towards the realization of his cherished aims; the method essential for his Instauration was partially completed; and he had attained as high a rank in the state as he had ever contemplated. But his actions in that position were not calculated to promote the good of his country. Connected with the years during which he held office is one of the weightiest charges against his character. Buckingham, notwithstanding the advice he had received from Bacon himself, was in the habit of addressing letters to him recommending the causes of suitors. In many cases these seem nothing more than letters of courtesy, and, from the general tone, it might fairly be concluded that there was no intention to sway the opinion of the judge illegally, and that Bacon did not understand the letters in that sense. This view is supported by consideration of the few answers to them which are extant. One outstanding case, however, that of Dr. Steward, casts some suspicion on all the others. The terms of Buckingham's note concerning it might easily have aroused doubts; and we find that the further course of the action was to all appearances exactly accommodated to Dr. Steward, who

---

1 A position which Bacon in some respects approved. See Essays, "Of Ambition." It is counted by some a weakness in princes to have favourites; but it is of all others the best remedy against ambitious great ones; for when the way of pleasing and displeasing lieth by the favourite, it is impossible any other should be over great.

2 Letters and Life, vi. 278, 294-296, 313.

3 Ibid. vii. 579-588, analysis of the case by D. H. Heath, who expresses a strong opinion against Bacon's action in the matter.

4 Ibid. vi. 444.
had been so strongly recommended. It is, of course, dangerous to form an extreme judgment on an isolated and partially understood case, of which also we have no explanation from Bacon himself, but if the interpretation advanced by Heath be the true one, Bacon certainly suffered his first, and, so far as we can see, just judgment on the case to be set aside, and the whole matter to be reopened in obedience to a request from Buckingham.

It is somewhat hard to understand Bacon's position with regard to the king during these years. He was the first officer of the crown, the most able man in the kingdom, prudent, sagacious and devoted to the royal party. Yet his advice was followed only when it chimed in with James's own will; his influence was of a merely secondary kind; and his great practical skill was employed simply in carrying out the measures of the king in the best mode possible. We know indeed that he sympathized cordially with the home policy of the government; he had no objection to such monopolies or patents as seemed advantageous to the country, and for this he is certainly not to be blamed. The opinion was common at the time, and the error was merely ignorance of the true principles of political economy. But we know also that the patents were so numerous as to be oppressive, and we can scarcely avoid inferring that Bacon more readily saw the advantages to the government than the disadvantages to the people. In November 1620, when a new parliament was summoned to meet on January following, he earnestly pressed that the most obnoxious patents, those of alehouses and inns, and the monopoly of gold and silver thread, should be given up, and wrote to Buckingham, whose brothers were interested, advising him to withdraw them from the impending storm. This prudent advice was unfortunately rejected. But while he went cordially with the king in domestic affairs, he was not quite in harmony with him on questions of foreign policy. Not only was he personally in favour of a war with Spain for the recovery of the Palatinate, but he foresaw, with a course of action the means of which was thought more closely the king and his parliament. He believed that the royal difficulties would be removed if a policy were adopted with which the people could heartily sympathize, and if the king placed himself at the head of his parliament and led them on. But his advice was neglected by the vacillating and peace-loving monarch, his proffered proclamation was put aside, and a weak, featureless production substituted in its place. Nevertheless the new parliament seemed at first more responsive than might have been looked for. A double subsidy was granted, which was expressly stated to be "not on any consideration or condition for or concerning the Palatinate." The session, however, was not far advanced when the question of patents was brought up; a determined attack was made upon the very ones of which Bacon had been in dread, and it was even proposed to proceed against the referrers (Bacon and Montagu) who had certified that there was no objection to them in point of law. This proposal, though pressed by Coke, was allowed to drop; while the king and Buckingham, acting under the advice of Williams, afterwards lord keeper, agreed to give up the monopolies. It was evident, however, that a determined attack was about to be made upon Bacon, and that the proceeding against the referrers was really directed against him. It is probable that this charge was dropped because a more powerful weapon had in the meantime been placed in his enemies' hands. This was the accusation of bribery and corrupt dealings in chancery suits, an accusation apparently wholly unexpected by Bacon, and the possibility of which he seems never to have contemplated until it was actually brought against him. At the beginning of the session a committee had been appointed for inquiring into abuses in the courts of justice. Some illegal practices of certain chancery officials had been detected and punished by the court itself, and generally speaking, there was a disposition to punish its affairs, which is, of course, less the case of Coke, he, and Lord Crandall, Earl of Middlesex (1575-1645) directly attacked some parts of the chancellor's administration. But on the 14th of March one

Christopher Aubrey appeared at the bar of the House, and charged Bacon with having received from him a sum of money while his suit was going on, and with having afterwards decided against him. Bacon's letter on this occasion is worthy of serious attention; he evidently thought the charge was but part of the deliberate scheme to ruin him which had already been in progress. A second accusation (Edward Egerton's case) followed immediately after, and was investigated by the House, who, satisfied that they had just matter for reprehension, appointed the 10th for a conference with the Lords. On that day Bacon, as he had feared, was too ill to attend. He wrote to the Lords excusing his absence, requesting them to appoint a convenient time for his defence and cross-examination of witnesses, and imploring them not to allow their minds to be prejudiced against him, at the same time declaring that he would not "trick up an innocence with cavillations, but plainly and ingenuously declare what he knew or remembered." The charges rapidly accumulated, but eventually it all moved upon them as purely moves, and was in hopes of defending himself. Nor did he seem to have lost his courage, if we are to believe the common reports of the day, though certainly they do not appear worthy of very much credit.

The notes bearing upon the interview which he obtained with the king show that he had begun to see more clearly the nature and extent of the offences with which he was charged, that he now felt it impossible altogether to exculpate himself, and that his hopes were directed towards obtaining some mitigation of his sentence. The long roll of charges made upon the 10th of April finally decided him; he gave up all idea of defence, and wrote to the king begging him to show favour in this emergency. The next day he sent in a general confession to the Lords, trusting that this would be considered satisfactory. The Lords, however, decided that it was not sufficient as a ground for their censure, and demanded a detailed and particular confession. Bacon, however, only admitted the high charges and went on to submit to the sentence, and to tender an answer by letter when required. On the 15th of April his "confession and humble submission" was handed in. In it, after going over the several instances, he says, "I do again confess, that on the points charged upon me, although they should be taken as myself have declared them, there is a great deal of corruption and neglect; for which I am heartily and penitently sorry, and submit myself to the judgment, grace, and mercy of the court." 7 On the 3rd of May, after considerable discussion, the Lords decided upon the sentence, which was,8 That he should undergo fine and ransom of £40,000; that he should be imprisoned in the Tower during the king's pleasure; that he should be for ever incapable of any office, place or employment in the state or commonwealth; that he should never sit in parliament, or come within the verge of the court. This heavy sentence was

1 For a full discussion of Bacon's connexion with the monopolies, see Gardiner, Prince Charles, &c., i. 353-373. For his opinion of monopolies in general, see Letters and Life, vii. 49.

2 Letters and Life, vii. 213: "I know I have clean hands and a clean heart, and I hope a clean house for friends or servants. But job himself, or whosoever was the justest judge, by such hunting for men's graces against him as hath been used against me, may for a time seem foul, specially in a time when greatness is the mark and accusation is the game."

3 Ibid. vii. 215-216.

4 From the letter to the king (March 25, 1621)—"Which misfortune to myself: I find myself in the cold tempest as is come upon me. I have been (as your majesty knoweth best) never author of any immoderate counsel, but always desired to have things carried summis modis. I have been no avaricious oppressor of the people, nor have I ever picked a bad or a fallacious man in my conversation or carriage. I have inherited no hatred from my father, but am a good patriot born. Whence should this be? For these are the things that use to raise dishkes abroad. A little for the bribes and gifts wherewith I am charged, when the book of hearts shall be opened, I hope I shall not be found to have the troubled fountain of a corrupt heart in a depraved habit of taking rewards to pervert justice, howsoever I may be frail, and perhaps of the aforesaid omission, I have been in it.

5 Ibid. vii. 227, and Gardiner, Prince Charles, &c., i. 450.

6 Letters and Life, vii. 236, 238.

7 Ibid. vii. 241.

8 Ibid. vii. 242-244: "I resteth therefore that, without fig-leaves, I do ingenuously confess and acknowledge, that having been charged with the particulars of the charge, not formally from the House but enough to inform my conscience and memory, I find matter sufficient and full, both to move me to desert the defence, and to move your lordship to condemn and condemn me.
only partially executed. The fine was in effect remitted by the king; imprisonment in the Tower lasted for about four days; a general pardon (not of course covering the parliamentary censure) was made out, and though delayed at the session's end by the Lord Keeper's illness, was passed and probably in November 1621. The cause of the delay seems to have lain with Buckingham, whose friendship had cooled, and who had taken offence at the fallen chancellor's unwillingness to part with York House. This difference was finally smoothed over, and it was probably through his influence that Bacon received the much-desired permission to come within the verge of the court. He never again sat in parliament.

So ends this painful episode, which has given rise to the most severe condemnation of Bacon, and which still presents great and perhaps insuperable difficulties. On the whole, the tendency of the most recent and thorough researches has been towards the opinion that Bacon's own account of the matter (from which, indeed, our knowledge of it is chiefly drawn) is substantially correct. He distinguishes three ways in which bribes may be given, and ingeniously confesses that his own acts amounted to corruption and were worthy of condensation. Now, corruption strictly interpreted would imply the deliberate sale of justice, and this Bacon explicitly denies, affirming that he never had bribe or reward in his eye or thought when he pronounced any sentence or ordered any course of action. Not only was this charge false, but the answers to his questions, and his answers to them, find many that are really of little weight. The twenty-eight and last, that of negligence in looking after his servants, though it did him much harm, may fairly be said to imply no moral blame. The majority of the others are instances of gratuities given after the decision, and it is to be regretted that the judgment of the peers gives us no means of determining how such gifts were looked upon, whether or not the acceptance of them was regarded as a "corrupt" practice. In four cases specifically, and in some others by implication, Bacon confesses that he had received bribes from suitors pendente lite. Yet he affirms, as we said before, that his intention was never swayed by a bribe; and so far as any of these cases can be traced, his decisions, often given in conjunction with some other official, are to all appearance thoroughly just. In several cases his judgment appears to have been given against the party bestowing the bribe, and in at least one instance, that of Lady Wharton, it seems impossible to doubt that he must have known when accepting the present that his opinion would be adverse to her cause. Although, then, he felt that these persons had procured "by the most artful and devious means that his own judgment would tend to purify the courts from them," he did not feel that he was guilty of perverting justice for the sake of reward. How far, then, is such defence or explanation admissible and satisfactory? It is clear that two things are to be considered: the one the guilt of taking bribes or presents on any consideration, the other the moral guilt depending upon the willful perversion of justice. The attempt has sometimes been made to defend the whole of Bacon's conduct on the ground that he did nothing that was not done by many of his contemporaries. Bacon himself disclaims a defence of this nature, and we really have no direct evidence which shows to what extent the offering and receiving of such bribes then prevailed. That the practice was common is indeed implied by the terms in which Bacon speaks of it, and it is not improbable that the fact of these gifts being taken by officials was a thing fairly well known, although all were aware of their illegal character, and it was plain that any public exposure of such dealings would be fatal to the individual against whom the charge was made out. Bacon knew all this; for remember, he does not say "pendente lite," the second, where the judge conceives the cause to be at an end, by the information of the party or otherwise, and useth not such diligence as he ought to inquire of it. And the third, where the cause is really ended, and it is sine fraude without relation to any precedent promise. . . . For the first of them I take myself to be as innocent as any born upon St. Innocent's Day, in my heart. For the second, I doubt on some particulars I may be faulty. And for the last, I conceived it to be no fault, but therein I desire to be better informed, that I may be twice pentent, once for the fact and again for the error."

he was well aware that the practice was in itself indefensible, and that his conduct was therefore corrupt and deserving of censure. So far, then, as the mere taking of bribes is concerned, it is plain that Bacon must not be held to have committed an action which is in itself indefensible. But the condemnation on his action cannot be as severe a condemnation as has ever been passed upon him. Yet in the face of this he does not hesitate to call himself "the justest chancellor that hath been in the five changes since Sir Nicholas Bacon's time," and this on the plea that his intentions had always been pure, and had never been affected by the presents he received. His justification has been set aside by modern critics, not on the ground that the evidence demonstrates its falsity, but because it is inconceivable or unnatural that any man should receive a present from another, and not suffer his judgment to be swayed thereby. It need hardly be said that such an a priori conviction is not a sufficient basis on which to found a sweeping condemnation of Bacon's integrity as an administrator of justice. On the other hand, even if it be admitted to be possible and conceivable that a present should be given by a suitor simply as seeking favourable consideration of his cause, and not as desirous of obtaining an unjust decree, and should be accepted by the judge on the same understanding, this would not entitle one absolutely to accept Bacon's statement.

Further evidence is necessary in order to give foundation to the delusion of the nation's integrity being so extremely impervious, nay, almost impermeable, that such can ever be produced. In these circumstances, due weight should be given to Bacon's own assertions of his perfect innocence and purity of intention; they ought not to be put out of court unless found in actual contradiction to the facts, and the reverse of this is the case, so far as has yet appeared.

The remaining five years of his life, though he was still harassed by want of means, for James was not liberal, were spent in work far more valuable to the world than anything he had accomplished in his high office. In March 1622 he presented to Prince Charles his History of Henry VII.; and, immediately, with unwearied industry, set to work to complete some portions of his great work. In November 1622 appeared the Historia Ventorum; in January 1622/3, the Historia Vitae et Mortis; and in October of the same year, the De Augmentis Scientiarum, a Latin translation, with many additions, of the Advancement. Finally, in December 1624, he published his Apologies, and Translations of some of the Psalms, dedicated to George Herbert; and, in 1625, a third and enlarged edition of Essays. This was a laborious life now drew rapidly to a close. In March 1626 he came to London, and when driving one day near Highgate, was taken with a desire to discover whether snow would act as an antiseptic. He stopped his carriage, got out to a cottage, purchased a fowl, and with his own hands assisted to stuff it with snow. He was seized with a sudden chill, and became so seriously unwell that he had to be conveyed to Lord Arundel's house, which was near at hand. Here his illness increased, the cold and chill brought on bronchitis and he died, after a few days' suffering, on the 9th of April 1626.
BACON, FRANCIS

Bacon's Works and Philosophy.

A complete survey of Bacon's works and an estimate of his place in literature and philosophy are matters for a volume. It is here proposed merely to classify the works, to indicate their general character and to enter somewhat more in detail upon what he himself regarded as his great achievement,—the organization of the sciences and the exposition of a new method by which the human mind might proceed with security and certainty towards the true end of all human thought and action.

Putting aside the letters and occasional writings, we may conveniently distribute the other works into three classes, Professional, Literary, Philosophical. The Professional works include the Novum Organum, The Advancement of Learning, the Instauratio Magna, and the treatises (possibly spurious) on the Use of the Law. "I am in good hope," said Bacon himself, "that when Sir Edward Coke's reports and my rules and decisions shall come to posterity, there will be (however now is thought) question who was the greater lawyer." If Coke's reports show demonstrable mastery of technical details, greater knowledge of precedent, and more of the dogged grasp of the letter than do Bacon's legal writings, there can be no dispute that the latter exhibit an infinitely more comprehensive intelligence of the abstract principles of jurisprudence, with a richness and ethical fulness that more than compensate for their lack of dry legal detail. Bacon seems indeed to have been a lawyer of the first order, with a keen scientific insight into the bearings of isolated facts and a power of generalization which admirably fitted him for the self-imposed task, unfortunately never completed, of digesting or codifying the chaotic mass of the English law.

Among the literary works are included all that he himself designated moral and historical pieces, and to these may be added some theological and minor writings, such as the Apophthegms. Of the moral works the most valuable are the Essays, which have been so widely read and universally admired. The matter is of the familiar, practical kind, that "comes home to men's bosoms." The thoughts are weighty, and even when not original have acquired a peculiar and unique tone or cast by passing through the crucible of Bacon's mind. A sentence from the Essays can rarely be mistaken for the production of any other writer. The style is quaint, original, abounding in allusions and witticisms, and rich, even to gorgeousness, with piled-up analogies and metaphors. The first edition contained only ten essays, but the number was increased in 1612 to thirty-eight, and in 1625 to fifty-eight. The short tract, Concerning Good and Evil, which appeared in the Sacrae Locupletissae Colletrum Sacrae Nationis Original, was afterwards incorporated with the De Augmentis. Along with these works may be classed the curiously learned piece, De Sapientia Veterum, in which he works out a favourite idea, that the mythological fables of the Greeks were allegorical and concealed the deepest truths of their philosophy. As a scientific explanation of the myths the theory is of no value, but it affords fine scope for the exercise of Bacon's unrivalled power of detecting analogies in things apparently most dissimilar. The Apophthegms, though hardly deserving Maudley's praise of being the best collection of jests in the world, contain a number of those significant anecdotes which Bacon used with such effect in his other writings. Of the historical works, besides a few fragments of the projected history of Britain there remains the History of Henry VII., a valuable work, giving a clear and animated narrative of the reign, and characterizing Henry with great skill. The style is in harmony with the matter, vigorous and flowing, but naturally with less of the quaintness and peculiarity of Bacon's style.

The peculiarities of Bacon's style were noticed very early by his contemporaries. (See Letters and Life, l. 268.) Raleigh and Jonson have both recorded their opinions of it, but no one has characterized it more happily than his friend, Sir Tobie Matthew. "A man so rare in knowledge of so many several kinds, ended with the facility and felicity of expressing it all in so elegant, significant, so abundant, and yet so choice and ravishing a way of words, of metaphors, of allusions, as perhaps the world hath not seen since it was a world."—"Address to the Reader" prefixed to Collection of English Letters (1600).

The series of the literary works is completed by the minor treatises on theological or ecclesiastical questions. Some of the latter, included among the occasional works, are sagacious and prudent and deserve careful study. Of the former, the principal specimens are the Meditationes Sacrae and the Confession of Faith. The Paradoxes (Characters of a believing Christian in paradoxes, and seeming contradictions), which was often and justly suspected, has been conclusively proved by Grosart to be the work of another author.

Philosophical Works.—The great mass of Bacon's writings consists of treatises or fragments, which either formed integral parts of his grand comprehensive scheme, or were closely connected with it. More exactly they may be classified under three heads: (A) Works originally intended to form parts of the Instauratio, but which were afterwards superseded or thrown aside; (B) Works connected with the Instauratio, but not directly included in its plan; (C) Works which actually formed part of the Instauratio Magna.

(A) This class contains some important tracts, which certainly contain little, if anything, that is not afterwards taken up and expanded in the more elaborate works, but are not undeserving of attention, from the difference in the point of view and method of treatment. The most valuable of them are: (1) The Advancement of Learning, of which no detailed account need be given, as it is completely worked up into the De Augmentis, and takes its place as the first part of the Instauratio. (2) Valerius Terminus, a very remarkable piece, composed probably about 1603, though perhaps retouched at a later period. It contains a brief and somewhat obscure outline of the first two parts in the Instauratio, and is of importance as affording us some insight into the gradual development of the system in Bacon's own mind. (3) Temporis Partus Masculus, another curious fragment, remarkable not only from its contents, but from its style, which is arrogant and offensive, in this respect unlike any other writing of Bacon's. The adjective masculus points to the power of bringing forth fruit possessed by the new philosophy, and perhaps this tract, which was the first of his writings to be published, may truly be said to have been projected by the same spirit that was to be the hallmarks of the work. The first eight births of time were to be looked upon as feminine or imperfect; it is used in a somewhat similar sense in Letters and Life, vi. 183, "In verbis masculis, no flourishing or painted words, but such words as are fit to go before deeds." (4) Redargutio Philosophiarum, a highly finished piece in the form of an oration, composed probably about 1600 or 1602, and containing in pretty full detail much of what afterwards appears in connexion with the Idola Theatr. i. of the Novum Organum. (5) Cognitata et Vida, perhaps the most important of the minor philosophical writings, dating from 1607 (though possibly the tract in its present form may have been to some extent altered), and containing in weighty and sonorous Latin the substance of the first book of the Organum. (6) The Descriptio Globi Intellectualis, which is to some extent intermediate between the Advancement and the De Augmentis, goes over in detail the general classification of the sciences, and is particularly on some points of minor interest. (7) The brief tract De Interpretatione Naturae Sententiarum Ordinatae is evidently a first sketch of part of the Novum Organum, and in phraseology is almost identical with it. (8) A few smaller pieces, such as the Inquisitio de Motu, the Color et Frigus, the Historia Soni et Audiorum and the Phaenomena Universi, are early specimens of his Natural History, and exhibit the first tentative applications of the new method.

(B) The second group consists of treatises on subjects connected with the Instauratio, but not forming part of it. The most interesting, and in many respects the most remarkable, is the philosophic romance, the New Atlantis, a description of an ideal state in which the principles of the new philosophy are carried out by political machinery and under state guidance, and where many of the results contemplated by Bacon are in imagination attained. The work was to have been completed by the addition of a second part, treating of the laws of a model commonwealth, which was never written. Another important tract is the De Principiis Aequi Originius secundum Fabulas Cupidintis et Coeli, where, under the disguise of two old mythological stories, he (in the manner of the Sapientia Veterum) finds the deepest truths...
concealed. The tract is unusually interesting, for in it he discusses at some length the limits of science, the origin of things and the nature of primitive matter, giving at the same time full details of Democritus among the ancient philosophers and of Teleseio among the modern. Deserving of attention are also the Cogitaciones de Natura Rorum, probably written early, perhaps in 1603, and the treatise on the theory of the tides, De Fluero et Refluero Maris, written probably about 1616.

(C) The philosophical works which form part of the Instauratio must of course be classed according to the positions which they respectively hold in that scheme of the sciences.

The great work, the reorganization of the sciences, and the restoration of man to that command over nature which he had lost by the fall, consisted in its final form of six divisions.

I. Partitiones Scientiarum, a survey of the sciences, either such as then existed or such as required to be constructed afresh—in fact, an inventory of all the possessions of the human mind. The famous classification1 on which this survey proceeds is based upon an analysis of the faculties and objects of human knowledge. This division is represented by the De Augmentis Scientiarum.

II. Interpretatio Naturae.—After the survey of all that has yet been done in the way of discovery or invention, comes the next method, by which the mind of man is to be trained and directed in its progress towards the renovation of science. This division is represented, though only imperfectly, by the Novum Organum, particularly book ii.

III. Historia Naturalis et Experimentalis.—The new method is valueless, because inapplicable, unless it be supplied with materials duly collected and presented—in fact, unless there be formed a competent natural history of the Phaenomena Universi. A short introductory sketch of the requisites of such a natural history, which, according to Bacon, is essential, necessary, the basis totius negotii, is given in the tract Paracelsus, appended to the Novum Organum. The principal works intended to form portions of the history, and either published by himself or left in manuscript, are Historia Ventorum, Historia Vitis et Mortis, Historia Denosi et Rori, and the extensive collection of facts and observations entitled Sylva Syvarum.

IV. Scala Intellectus.—It might have been supposed that the new philosophy could now be inaugurated. Materials had been supplied, along with a new method by which they were to be treated, and naturally the next step would be the finished result. But for practical purposes Bacon interposed two divisions between the preliminaries and the philosophy itself. The first was intended to consist of types or examples of investigations conducted by the new method, serviceable for keeping the whole process vividly before the mind, or, as the title indicates, such that the mind could run rapidly up and down the several steps or grades in the process. Of this division there seems to be only one small fragment, the Filium Labirinti, consisting of but two or three pages.

V. Promoti, forerunners of the new philosophy. This part, strictly speaking, is quite extraneous to the general design. According to the Distributio Operis,2 it was intended to contain certain speculations of Bacon's own, not formed by the new method, but by the unassisted use of his understanding. These, therefore, form temporary or uncertain anticipations of the new philosophy. There is extant a short preface to this division of the work, and according to Spedding, some of the miscellaneous treatises, such as De Principiis, De Fluero et Refluero, Cogitaciones de Natura Rorum, may probably have been intended to be included under this head. This supposition receives some support from the manner in which the fifth part is spoken of in the Novum Organum, i. 116.

VI. The new philosophy, which is the work of future ages, and the result of the new method.

Bacon's grand motive in his attempt to found the sciences anew was the intense conviction that the knowledge man possessed was of little service to him. "The knowledge whereof the world is now possessed, especially that of nature, extendeth not to magnitude and certainty of works."3 Man's sovereignty over nature, which is founded on knowledge alone, had been lost, and instead of the free relation between things and the human mind, there was nothing but vain notions and blind experiments. To restore the original commerce between man and nature, and to recover the imperium hominis, is the grand object of all science. The want of success which had hitherto attended efforts in the same direction had been due to many causes, but chiefly to the want of appreciation of the nature of philosophy and its real aim. Philosophy is not the science of things divine and human; it is not the search after truth.4 "I find that those that have sought knowledge for itself, and not for benefit or ostentation, or any practical enablement in the course of their life, have nevertheless propounded to themselves a wrong mark, namely, satisfaction (which men call Truth) and not operation."5 "Is there any such happiness as for a man's mind to be raised above the confusion of things, where he may have the prospect of the order of nature and error of man? But is this a view of delight only and not of discovery? of contentment and not of benefit? Shall he not as well discern the riches of nature's warehouse as the beauty of her shops? Is truth ever barren? Shall he be not able thereby to produce worthy effects, and to endow the life of man with infinite commodities?"6 Philosophy is altogether practical; it is of little matter to the fortunes of humanity what abstract notions one may entertain concerning the nature and the principles of things. This truth, however, has never yet been recognized;7 it has not yet been seen that the true aim of all science is "to endow the condition and life of man with new powers or works,"8 or "to extend more widely the limits of the power and greatness of man."9 Nevertheless, it is not to be imagined that by this being proposed as the great object of search there is thereby excluded all that has hitherto been looked upon as the higher aims of human life, such as the contemplation of truth. Not so, but by following the new aim we shall also arrive at a true knowledge of the universe in which we are, for without knowledge there is no power; truth and utility are in ultimate aspect the same; "works themselves are of greater value as pledges of truth than as contributing to the comforts of life."10 Such was the conception of philosophy with which Bacon started, and in which he felt himself to be thoroughly original. As his object was new and hitherto unproposed, so the method he intended to employ was different from all modes of investigation hitherto attempted. "It would be," as he says, "an unsound fancy and self-contradictory, to expect that things which have never yet been done can be done except by means which have never yet been tried."11 There were many obstacles in his way, and he seems always to have felt that the first part of the new scheme must be a pars desverens, a destructive criticism of all other methods. Opposition was to be expected, not only from previous philosophies, but especially from the human mind itself. In the first place, the human mind is the one which has to be changed, the one in which we are to find a different conception of things, the one of whom, in despair of knowledge, maintained that all science was impossible; while the other, resting on authority and on the learning that had been handed down from the Greeks, declared that science was already completely known, and consequently devoted their energies to methodizing and elaborating it. Secondly, within the domain of science itself, properly so called, there were two "kind of rovers" who must be dismissed. The first were the speculative or logical philosophers, who construe the universe ex analogia hominis, and not ex analogia mundi, who fashion nature according to preconceived ideas, and who employ in their investigations syllogism and abstract reasoning. The second class, who were equally consistent, of those who practised blind experience, which is mere...
BACON, FRANCIS

groping in the dark (nec experientia mera palatii est), who occasionally hit upon good works or inventions, which, like Atlantis’s apples, distanced them from further steady and gradual progress towards universal truth. In place of these struggling efforts of the unassisted human mind, a graduated system of helps was to be supplied, by the use of which the mind, when placed on the right road, would proceed with unerring and mechanical certainty to the invention of new arts and sciences.

Such were to be the peculiar functions of the new method, though it has not definitely appeared what that method was, or to what objects it could be applied. But, before proceeding to unfold his method, Bacon found it necessary to enter in considerable detail upon the general subject of the obstacles to progress, and devoted nearly the whole of the first book of the Organum to the examination of them. This discussion, though strictly speaking extraneous to the scheme, has always been looked upon as a most important part of his philosophy, and his name is perhaps as much associated with the doctrine of Idols (Idola) as with the theory of induction or the classification of the sciences.

The doctrine of the kinds of fallacies or general classes of errors into which the human mind is prone to fall, appears in many of the works written before the Novum Organum, and the treatment of them varies in some respects. The classification in the Organum, however, not only has the author’s sanction, but has received the stamp of historical acceptance; and comparison of the earlier notices, though a point of literary interest, has no important philosophical bearing. The Idola (Nov. Or. i. 30) false notions of things, or erroneous ways of looking at nature, are of four kinds: the first two innate, pertaining to the very nature of the mind and not to be eradicated; the third creeping insensibly into men’s minds, and hence in a sense innate and inseparable; the fourth imposed from without. The first kind are the Idola Tribus, idols of the tribe, fallacies incident to humanity or the race in general. Of these, the most prominent are—the propensity to suppose in nature greater order and regularity than there actually is; the tendency to support a preconceived opinion by confirmatory instances, neglecting all negative or opposed cases; and the tendency to generalize from few observations, or to give reality to mere abstractions, fragments of the mind. Manifest errors also result from the weakness of the senses, which affords scope for mere conjecture; from the influence exercised over the understanding by the will and passions; from the restless desire of the mind to penetrate to the ultimate principles of things; and from the belief that “man is the measure of the universe,” whereas, in truth, the world is received by us in a distorted and erroneous manner. The second kind are the Idola Species, idols of the cave, or errors incident to the peculiar mental or bodily constitution of each individual, according to the state of the individual’s mind is his view of things. Errors of this class are innumerable, because there are numberless varieties of disposition; but some very prominent specimens can be indicated. Such are the tendency to make all things subservient to, or take the colour of some favourite subject, the extreme fondness and reverence either for what is ancient or for what is modern, and excess in noting either differences or resemblances of things. A practical rule for avoiding these is also given: “In general, let every student of nature take this as a rule, that whatever his mind seizes and dwells upon with particular satisfaction is to be held in suspension.” The third class are the Idola Fori, idols of the market-place, errors arising from the influence exercised over the mind by mere words. This, according to

1 The word Idola is manifestly borrowed from Plato. It is used twice in connexion with the Platonic Ideas (N. O. i. 23, 124) and is compared with them as the false appearance. The word in Plato has the flat meaning of ‘false notions’ or thoughts, and the passage evidently referred to by Bacon is that in the Rep. vii. 516 a, καὶ πρῶτον μὲν τὸν ἅντα καὶ μῖσας καὶ ταύτα ταύτικα ταύτικα, καὶ ταύτικα μικρά τα μεγάλα μεγάλα, καὶ ταύτικα μικρά τα μεγάλα μεγάλα. It is explained well in the Advancement, bk. i. (Works, ii. 287). (For valuable notes on the Idola, see T. Fowler’s Nov. Or. i. 38 notes; especially for a comparison of the Idola with Roger Bacon’s Officindula.)

2 N. O. i. 58.

Bacon, is the most troublesome kind of error, and has been especially fatal in philosophy. For words introduce a fallacious mode of looking at things in two ways: first, there are some words that are really merely names for non-existent things, which are yet supposed to exist simply because they have received a name; secondly, there are names hastily and unskilfully abstracted from a few objects and applied recklessly to all that has the faintest analogy with these objects, thus causing the grossest confusion. The fourth and last class are the Idola Theatri, idols of the theatre, i.e. fallacious modes of thinking resulting from received systems of philosophy and from erroneous methods of demonstration. The criticism of the demonstrations is introduced later in close connexion with Bacon’s new method; they are the rival modes of procedure, to which his own is definitely opposed. The philosophies which are “redargued” are divided into three classes, the sophistical, of which the best example is Aristotle, who, according to Bacon, forces nature into his abstract schemata and thinks to explain by definitions; the empirical, which from few and limited experiments leaps at once to general conclusions; and the superstitious, which corrupts philosophy by the introduction of poetical and theological notions.

Such are the general causes of the errors that infest the human mind; by their exposure the way is cleared for the introduction of the new method. The nature of this method cannot be understood until it is exactly seen to what it is to be applied. What idea had Bacon of science, and how is his method connected with it? Now, the science which was specially and invariably contemplated by him was natural philosophy, the great mother of all the sciences; it was to him the type of scientific knowledge, and its method was the method of all true science. To discover exactly the characteristics and the object of natural philosophy it is necessary to examine the place it holds in the general scheme furnished in the Advancement or De Augmentis. All human knowledge, it is there laid down, may be referred to man’s memory or imagination or reason. In the first, the bare facts presented to sense are collected and stored up; the exposition of them is history, which is either natural or civil. In the second, the truths of the sciences are separated or divided in ways not corresponding to nature but after the mind’s own pleasure, and the result is poesy or feigned history. In the third, the materials are worked up after the model or pattern of nature, though we are prone to err in the progress from sense to reason; the result is philosophy, which is concerned either with God, with nature or with man, the second being the most important. Natural philosophy is again divided into speculative or theoretical and operative or practical, according to the end is contemplation or works. Speculative or theoretical natural philosophy has to deal with natural substances and qualities and is subdivided into physics and metaphysics. Physics inquires into the efficient and material causes of things; metaphysics, into the formal and final causes. The principal objects of physics are concrete substances, or abstract though physical qualities. The research into abstract qualities, the fundamental problem of physics, comes near to the metaphysical study of forms, which indeed differs from the first only in being more general, and in having as its results a form strictly so-called, i.e. a nature or quality which is not limited or specific manifestation of some higher and better-known genus. Natural philosophy is, therefore, in ultimate resort the study of forms, and, consequently, the fundamental problem of philosophy in general is the discovery of these forms.

“On a given body to generate or superinduce a new nature or natures, is the work and aim of human power. . . . Of a given nature to discover the form or true specific difference, or nature-regulating concept, i.e., in other words, the power of emanation (for these are the terms which are nearest to a description of the thing), is the work and aim of human knowledge.”

The questions, then, whose answers give the key to the whole Baconian philosophy, may be put briefly thus—What are

1 N. O. i. 79, 80, 98, 108.

2 On the meaning of the word form in Bacon’s theory see also Fowler’s N. O. introd. § 8.

3 N. O. ii. 1.
forms? and how is it that knowledge of them solves both the theoretical and the practical problem of science? Bacon himself, as may be seen from the passage quoted above, finds great difficulty in giving an adequate and exact definition of what he means by a form. As a general description, the following passage from the Novum Organum, ii. 4, may be cited:—

"The form of a nature is such that given the form the nature infallibly follows. . . . Again, the form is such that if it be taken away, the nature vanishes. And the form is such that it deduces the given nature from some source of being which is inherent in more natures, and which is better known in the natural order of things than the form itself." 11

From this it would appear that, since by a nature is meant some sensible quality, superinduced upon, or possessed by, a body, so by a form we are to understand the cause of that nature, which cause is itself a determinate case or manifestation of some general or abstract quality inherent in a greater number of objects. But all these are mostly marked by which a form may be recognized, and do not explain what the form really is. A further definition is accordingly attempted in Aph. 13:—

"The form of a thing is the very thing itself, and the thing differs from the form no otherwise than as the apparent differs from the real, or the external from the internal, or the thing in reference to the matter and subject that is susceptible of them. Thus the form of heat or the form of light is the same thing as the law of heat or the law of light. Matter rather than forms should be the object of observation, intuition, and experiment, as distinct from action and action, and law of action or motion; for forms are figures of the human mind, unless you will call those laws of action forms. Forms or true differences of things, which are in fact laws of pure act. 4 For though in nature nothing exists besides individual bodies, performing pure individual acts according to a fixed law, yet in philosophy this very law, and the investigation, discovery and explanation of it, is the foundation as well of knowledge as of action. And it is this law, with its clauses that I mean when I speak of forms." 6

Several important conclusions may be drawn from these passages. In the first place, it is evident that Bacon, like the Atomical school, of whom he highly approved, had a clear perception and a firm grasp of the physical character of natural principles; his forms are no ideas or abstractions, but highly general physical properties. Further, it is hinted that these general qualities may be looked upon as the modes of action of simple bodies. This fruitful conception, however, Bacon does not work out; and though he uses the word cause, and identifies form with formal cause, yet it is perfectly apparent that the modern notion of causal relations, whether dynamical, and of nature as in a process of flow or development, are foreign to him, and that in his view of the ultimate problem of science, cause meant cause immanent, or underlying substance, effects were not consequents but manifestations, and nature was regarded in a purely statical aspect. That this is so appears even more clearly when we examine his general conception of the unity, gradation and function of the sciences. That the sciences are organically connected is a thought common to him and to his distinguished predecessor Roger Bacon. 12 I that hold it for a great impendiment towards the advancement and further invention of knowledge, that particular arts and sciences have been disincorporated from general knowledge, do not understand one

and the same thing which Cicero's discourse and the note and conceit of the Grecians in their word circle learning do intend. For I mean not that use which one science hath of another for ornament or help in practice; but I mean it directly of that use by way of supply of light and information, which the particulars and instances of one science do yield and present for the framing or correcting of the axioms of another science in their very truth and notion." 16 In accordance with this, Bacon placed at the basis of the particular sciences which treat of God, nature and man, one fundamental doctrine, the Prima Philosophia, or first philosophy, the function of which was to display the unity of nature by connecting into one body of truth such of the highest axioms of the subordinate sciences as were not special to one science, but common to several. 17 This first philosophy had also to investigate what are called the adventitious or transcendental conditions of essences, such as Much, Little, Like, Unlike, Possible, Impossible, Being, Nothing, the logical discursion of which certainly belonged rather to the laws of reasoning than to the existence of things, but the physical or real treatment of which might be expected to yield answers to such questions as, why certain substances are numerous, others scarce; or why, if like attracts like, iron does not attract iron. Following this summary philosophy come the sciences proper, rising like a pyramid in successive stages, the lowest floor being occupied by natural history or experience, the second by physics, the third, which is next the peak of unity, by metaphysics. 5 The knowledge of the peak, or of the one law which binds nature together, is perhaps denied to man. Of the sciences, physics, as has been already seen, deals with the efficient and material, i.e. with the variable and transient, causes of things. But its inquiries may be directed either towards concrete bodies or towards abstract qualities. The first kind of investigation rises to a little above more natural history; but the other is more important and paves the way for metaphysics. It handles the configurations and the aptitudes or motions of matter. The configurations, or inner structure of bodies, include dense, rare, heavy, light, hot, cold, &c., in fact, what are elsewhere called simple natures. Motions are either simple or compound, the latter being the sum of a number of the former. In physics, however, these matters are treated only as regards their material or efficient causes, and the result of inquiry into any one case gives no general rule, but only facilitates invention in some similar instance. Metaphysics, on the other hand, treats of the formal or final cause 10 of these same substances and qualities, and results in a general rule. With regard to forms, the investigation may be directed either towards concrete bodies or towards qualities. But the forms of substances are so perplexed and undetermined, that it is not yet agreed which have to do with them at all, or such inquiry as is possible should be put off for a time, and not entered upon until forms of a more simple nature have been rightly investigated and discussed." 11 10 To inquire into the form of a lion, of an oak, or gold, nay, even of water or air, is a vain pursuit; but to inquire the form of dense, rare, hot, cold, &c., as well configurations as motions, which in treating of physics I have in

6 Valerius Terminus, iii. 228-229.
7 Cf. N. O. ii. 27. Bacon nowhere enters upon the questions of how such a science is to be constructed, and how it can be expected to possess an independent method while it remains the mere receptacle of generalizations. Several sciences have a content which varies with their progress. His whole conception of Prima Philosophia should be compared with such a modern work as the First Principles of Herbert Spencer.
8 It is to be noticed that this scale of nature corresponds with the scale of ascending axioms.
9 Cf. also for motions, N. O. ii. 48.
10 The knowledge of final causes does not lead to works, and the consideration of which is not usually excluded from physics. There is no opposition between the physical and final causes; in ultimate resort the mind is compelled to think the universe as the work of reason, to refer facts to God and Providence. The idea of final cause is also fruitful in science which has to do with human action. (Cf. De Aug. iii. cc. 4, 5; Nov. Org. i. 48. ii. 2.)
11 De Aug. iii. 4. In the Advancement (Works, iii. 355) it is distinctly said that they are not to be inquired into. One can hardly say how the Baconian method could have applied to concrete substances.
great part enumerated (I call them forms of the first class), and which (like the letters of the alphabet) are not many, and yet make up and sustain the essences and forms of all substances. This, I say, is it which I am attempting, and which constitutes and defines that part of metaphysic of which we are not inquiring. "Physics inquires into the same qualities, but does not publish its investigations into the nature of the more general causes. We thus at last attain a definite conclusion with regard to forms, and it appears clear that in Bacon's belief the true function of science was the search for a few fundamental physical qualities, highly abstract and general, the combinations of which give rise to the simple natures and complex phenomena around us. His general conception of the universe may therefore be called mechanical or statical; the cause of each phenomenon is supposed to be actually contained in the phenomenon itself, and by a sufficiently accurate process could be sifted out and brought to light. As soon as the causes are known man regains his power over nature, for "whosoever knows any form, knows also the utmost possibility of superinducing that nature upon every variety of matter, and so is less restrained and tied in operation either to the basis of the matter or to the condition of the efficients."  

Nature thus presented itself to Bacon's mind as a huge congeries of phenomena, the manifestations of some simple and primitive qualities, which were hid from us by the complexity of the things themselves. The world was a vast labyrinth, amid the windings of which we require some clue or thread whereby we may track our way to knowledge and thence to power. This thread, the fluxus labynthici, is the new method of induction. But, as has been frequently pointed out, the new method could not be applied until facts had been observed and collected. This is an indispensable preliminary. "Man, the servant and interpreter of nature, can do and understand so much, and so much only, as he has observed in fact or in thought of the course of nature; beyond this he neither knows anything nor can do anything." The proposition that our knowledge of nature necessarily begins with observation and experience, is common to Bacon and many contemporary reformers of science, but he laid peculiar stress upon it, and gave it a new meaning. What he really meant by observation was an competent natural history or collection of facts. "The firm foundations of a purer natural philosophy are laid in natural history." "First of all we must prepare a natural and experimental history, sufficient and good; and this is the foundation of all."  

The senses and the memory, which collect and store up facts, must be assisted; there must be a ministration of the senses and another of the memory. For not only are instances required, but these must be arranged in such a manner as not to distract or confuse the mind, i.e. tables and arrangements of instances must be constructed. In the preliminary collection the greatest care must be taken that the mind be absolutely free from preconceived ideas; nature is only to be conquered by obedience; man must be merely receptacle. "All depends on keeping the eye steadily fixed upon the facts of nature, and so receiving their images truly as they are; for God has so made it that we should give out a dream of our own imaginations for a pattern of the world; rather he graciously grants to us to write an apocalypse or true vision of the footsteps of the Creator imprinted on his creatures."  

Concealed among the facts presented to sense are the causes or forms, and the problem therefore is so to analyse experience,  
so to break it up into pieces, that we shall with certainty and mechanical ease arrive at a true conclusion. This process, which forms the essence of the new method, may in its entirety, as a ministration to the reason, be called a logic; but it differs widely from the ordinary or school logic in end, method and form. Its aim is to acquire command over nature by knowledge, and to invent new arts, whereas the old logic strove only after dialectic victories and the discovery of new arguments. In method the difference is even more fundamental. Hitherto the mode of demonstration had been by the syllogism; but the syllogism is, in many respects, an incompetent weapon. It is controlled by its first principles, on trust from the science in which it is employed; it cannot cope with the subtlety of nature; and it is radically vitiated by being founded on hastily and inaccurately abstracted notions of things. For a syllogism consists of propositions, propositions of words, and words are the symbols of actions. Now the first step in accurate progress from sense to reason, or true philosophy, is to frame a bona fide or accurate conception of the thing; but the received logic never does this. It flies off at once from experience and particulars to the highest and most general propositions, and from these descends, by the use of middle terms, to axioms of lower generality. Such a mode of procedure may be called anticipatio naturae (for in it reason is allowed to prescribe to things), and is opposed to the true method, the interpretatio naturae, in which reason follows and obeys nature, discovering her secrets by obedience and submission to rule. Lastly, the very form of induction that has been used by logicians in the collection of their instances is a weak and useless thing. It is a mere enumeration of a few known facts, makes no use of exclusions or rejections, concludes precariously, and is always liable to be overthrown by a negative instance.  

In radical opposition to this method the Baconian induction begins by supplying helps and guides to the senses, whose unassisted information could not be relied on. Notions were formed carefully, and not till after a certain process of induction was completed. The formation of notions was to be carried on by way of ascending scale. "Then and only then may we hope well of the sciences, when in a just scale of ascent and by successive steps, not interrupted or broken, we rise from particulars to lesser axioms; and then to middle axioms, one above the other; and last of all to the most general." Finally the very form of induction itself must be new. "The induction which is to be available for the discovery and demonstration of sciences and arts must analyse nature by proper rejections and exclusions; and then, after a sufficient number of negatives, come to a conclusion on the affirmative instances, which has not yet been done, or even attempted, save only by Plato. And this induction must be used not only to discover axioms, but also in the formation of notions." This view of the function of exclusion is closely connected with Bacon's doctrine of forms,  

Bacon's summary is valuable. "In the whole of the process which leads from the senses and objects to axioms and conclusions, the demonstrations which we use are deceptive and incompetent. The process consists of four parts, and as has many faults. In the first place, the impressions of the sense itself are frail, for the senses both fails us and deceives us. But its shortcomings are to be supplied and its deceptions to be corrected. Secondly, notions are all drawn from the impressions of the sense, and are indefinite and confused; whereas they should be definite and distinctly bounded. Thirdly, the induction is amiss which infers the principles of sciences by simple enumeration, and does not, as it ought, employ exclusions and solutions (or separations) of nature. Lastly, that method of discovery and proof according to which the general parts are so estabished in immediate axioms that if they be tried and proved by them, is the parent of error and the curse of all science. — N. O. i. 69.

"O. i. 105.

"Ibid, i. 104; cf. i. 19-26.

The extract gives an answer to the objection sometimes raised that Bacon is not original in his theory of induction. He certainly admits that Plato has used a method somewhat akin to his own; but it has frequently been contended that his induction is nothing more than the syllogism. Cf. cf. Pref. to Instaur. — Prot. and the metaphysic, Pref. to Instaur. — Prot. Of the "N. O. 310, and for a criticism, Waddington, "Essays de Logique, p. 261, sqq." This seems a mistake. Bacon did not understand by induction the argument from particulars to a general proposition: he looked upon the exclusion and rejection, or the elimination of induction. To this process he was led by his doctrine of forms, of which it is the necessary consequence: it is the infallible result of his view of science and its problem, and is as original as that is. Whoever accepts Bacon's doctrine of cause must accept at the same time his theory of the way in which the cause may be sifted out from among the phenomena. It is evident that the Socratic search for the essence by an analysis of instances—an induction ending in a definition—has a strong resemblance to the Baconian inductive method. — N. O. i. 105.

Thus the last step in the theoretical analysis gives the first means for the practical operation. Cf. Aristotle. Eth. Nic. iii. 12, τί εξωτερικόν εν τῷ καθιστάτω πρῶτον εἰς τῇ γένεσιν. Cf. also Nov. O. i. 103.

Cognitiones (Works, iii. 187).

Pref. to Instaur. — Prot.
and is in fact dependent upon that theory. But induction is neither the whole of the new method, nor is it applicable to forms only. There are two other grand objects of inquiry: the one, the transformation of concrete bodies; the other, the investigation of the latent powers and the latent schematism or configuration. With regard to the first, in ultimate result it depends upon the theory of forms; for whenever the compound body can be regarded as the sum of certain simple natures, then our knowledge of the forms of these natures gives us the power of superimposing a new nature on the concrete body. As regards the latent process (latens processus) which goes on in all cases of generation and continuous development or motion, we examine carefully, and by quantitative measurements, the gradual growth and change from the first elements to the completed thing. The same kind of investigation may be extended to many cases of natural motion, such as voluntary action or nutrition; and though inquiry is here directed towards concrete bodies, and does not therefore penetrate so deeply into reality as in research for forms, yet great results may be looked for with more confidence. It is to be regretted that Bacon did not complete this portion of his work, in which for the first time he approaches modern conceptions of change. The latent configuration (schematismus) of the concrete body must be known before we can hope to superimpose a new nature upon it. This can only be discovered by analysis, which will disclose the ultimate constituents (natural particles, not atoms) of bodies, and lead back the discussion to forms or simple natures, whereby alone can true light be thrown on these obscure questions. Thus, in all cases, scientific explanation depends upon knowledge of forms; all phenomena or secondary qualities are accounted for by being referred to the primary qualities of matter.

The several steps in the inductive investigation of the form of any nature flow readily from the definition of the form itself. For that is always and necessarily present when the nature is present, absent when it is absent, decreases and increases according as the nature decreases and increases. It is therefore requisite for the inquiry to have before us instances in which the nature is present. The list of these is called the table of Essence and Presence. Secondly, we must have instances in which the nature is absent; only as such cases might be infinite, attention should be directed to such of them as are most easily accessible, and presence. The list in this case is called the table of Absence in Proximity. Thirdly, we must have a number of instances in which the nature is present in different degrees, either increasing or decreasing in the same subject, or variously present in different subjects. This is the table of Degrees, or Comparison. After the formation of these tables, we proceed to apply what is perhaps the most valuable part of the Baconian method, and that in which the author took most pride, the process of exclusion or rejection. This elimination of the non-essential, grounded on the fundamental propositions with regard to forms, is the most important of Bacon's contributions to the logic of induction, and that in which, as he repeatedly says, his method differs from all previous philosophies. It is evident that if the tables were complete, and our notions of the respective phenomena clear, the process of exclusion would be a merely mechanical counting out, and would infallibly lead to the detection of the cause or form. But it is just as evident that these conditions can never be adequately fulfilled. Bacon saw that his method was impracticable (though he seems to have thought the difficulties not insuperable), and therefore set to work to devise new helps, adinimicia. These he enumerates in i., Aph. 21—Prerogative Instances, Supports of Induction, Rectification of Induction, Varying the Investigation according to the Nature of the Subject, Prerogative Natures, Limits of Investigation, Application to Practice, Preparations for Investigation, the Ascending and Descending Scale of Axioms.

The remainder of the Organum is devoted to a consideration of the twenty-seven classes of Prerogative Instances, and though it contains much that is both luminous and helpful, it adds little to our knowledge of what constitutes the Baconian method.

On the other hand we have but a few scattered hints. But although the rigorous requirements of science could only be fulfilled by the employment of all these means, yet in their absence it was permissible to draw from the tables and the exclusion a hypothetical conclusion, the truth of which might be verified by the use of the other processes; such an hypothesis is called fantastically the First Vintage (Viníndematio). The inductive method, so far as exhibited in the Organum, is exemplified by an investigation into the nature of heat.

Such was the method devised by Bacon, and to which he ascribed the qualities of absolute certainty and mechanical simplicity. But even supposing that this method were accurate and completely unfolded, it is evident that it could only be made applicable and produce fruit when the phenomena of the universe have been very completely tabulated and arranged. In this demand for a complete natural history, Bacon also felt that he was refused; and he was deeply impressed with the necessity for it; in fact, he seems occasionally to place an even higher value upon it than upon his Organum. Thus, in the preface to his series of works forming the third part of the Instauratio, he says: 'It comes, therefore, to this, that my Organum, even if it were completed, would not without the Natural History much advance the Instauratio of the Sciences, whereas the Natural History without the Organum would advance it not a little.' But a complete natural history is evidently a thing impossible, and in fact a history can only be collected by attending to the requirements of the Organum. This was seen by Bacon, and what may be regarded as his final opinion on the question is given in the important letter to Jean Antoine Baranzeno (1255): 'With regard to the multitude of instances by which men may be deterred from the attempt, here is my answer. First, what need to dissemble? Either store of instances must be procured, or the business must be given up. All other ways, however enticing, are impassable. Secondly, the prerogatives of instances, and the mode of experimenting upon experiments of light (which I shall hereafter explain), will diminish the multitude of them very much. Thirdly, what matter, I ask, if the description of the instances should fill six times as many volumes as Pliny's History? ... For the true natural history is to take nothing except instances, and to use them in forming the natural history. The Organum and the History are thus correlative, and form the two equally necessary sides of a true philosophy; by their union the new philosophy is produced.

Summary.—Two questions may be put to any doctrine which professes to effect a radical change in philosophy or science. Is it original? Is it valuable? With regard to the first, it has been already pointed out that Bacon's induction or inductive method is distinctly his own, though it cannot and need not be maintained that the general spirit of his philosophy was entirely new. The value of the method is the separate and more difficult question. It has been assailed on the most opposite grounds. Macaulay, while admitting the accuracy of the process, denied its efficiency, on the ground that an operation performed naturally was not rendered more easy or efficacious by being subjected to analysis. This objection is curious when confronted with the repeated assertion that the natural method pursued by the unassisted human reason is distinctly opposed to his; and it is besides an argument that tells so strongly against many sciences, as to be comparatively worthless when applied to any one. There are, however, more formidable objections against the method. It has been pointed out, and with perfect justice,

that science in its progress has not followed the Baconian method, that no one discovery can be pointed to which can be definitely ascribed to the use of his rules, and that men the most celebrated for their scientific acquirements, while paying homage to the name of Bacon, practically set at naught his most cherished precepts. The reason of this is not far to seek, and has been pointed out by logicians of the most diametrically opposed schools. The mechanical character both of the natural history and of the logical method applied to it, resulted necessarily from Bacon's radically false conception of the nature of cause and of the causal relation. The whole logical or scientific problem is treated as if it were one of co-existence, to which in truth the method of exclusion is scarcely applicable, and the assumption is constantly made that each phenomenon has one and only one cause. The inductive formation of axioms by a gradually ascending scale is a route which no science has ever followed, and by which no science could ever make progress. The true scientific procedure is by hypothesis followed up and tested by verification; the most powerful instrument is the deductive method, which Bacon can hardly be said to have recognized. The power of framing hypothesis points to another want in the Baconian doctrine. If that power form part of the true method, then the mind is led to the true nature, and molds the experience received by it in accordance with its own constructive ideas or conceptions; and yet further, the minds of various investigators cannot be reduced to the same dead mechanical method. There will still be room for the scientific use of the imagination and for the creative flashes of genius.

If, then, Bacon himself made no contributions to science, if no discovery can be shown to be due to the use of his rules, if his method be logically defective, and the problem to which it was applied one from its nature incapable of adequate solution, it may not unreasonably be asked, How has he come to be looked upon as the great leader in the reformation of modern science? How is it that he shares with Descartes the honours of inaugurating modern philosophy? To this the true answer seems to be that Bacon owes his position not only to the general spirit of his philosophy, but to the manner in which he worked into a concept (1860); Liebig, Uber Francis Bacon von Verulam, &c. (1863). Although Liebig points out how little science proceeds according to Bacon’s rules, yet his other ideas seem of extremely little value. In a very offensive and quite unjustifiable tone, which is severely commented on by Sigwart and Fischer, he attacks the Baconian methods and its results. These results he claims to find in the process of the scientific life of himself and of his contemporaries, the nature of the work (N. I. i. 117; cf. Rawley’s Pref. to the S. S.), and thus putting a false interpretation on the experiments there noted. It is not surprising that he should detect many flaws, but he never failed to exaggerate an error, and seems sometimes completely to miss the point of what Bacon says. (See particularly his remarks on S. S. 33. 336.) The method he explains in such a way as to show he has not a grasp of its true nature. He brings against Bacon, Liebig says, the accusation of making inductive reasoning from the undetermined perceptions of the senses, of using imagination, and of putting a quite arbitrary interpretation on phenomena. He crowns his criticism by exposing what he considers to be the true scientific method, as if he had but to describe the Baconian doctrine against which his attack ought to have been directed. (See his account of the method, Uber Bacon, 47-49; K. Fischer, Bacon, pp. 499-502.)

2. J. Whewell. Phil. of Ind. Sc. ii. 399, 402-403; Ellis, Int. to Bacon’s Works, i. 39, 61; Brewster, Newer, i. 404; Jeffes, Princ of Science ii. 220. A severe judgment on Bacon’s method is given in Dühring’s Geschichte, vol. ii. p. 290. The resemblance between Bacon’s method of reasoning, from which the merits of Roger Bacon are brought prominently forward.

3. Although it must be admitted that the Baconian method is fairly open to the above-mentioned objections, it is curious and significant that Bacon was not thoroughly ignorant of them, but with deliberate commonplace of the time. For himself he pointed out that the notions of which he speaks in any way correspond to what Whewell and Ellis would call “conceptions or ideas furnished by the mind of the thinker”; nor do we imagine that Bacon would have admitted these as necessary elements in the inductive process. But he was certainly not ignorant of what may be called a deductive method, and of a kind of hypothesis. This is clear from the way he makes of the Vindiciae, from certain hints as to the testing of axioms, from his adoption of the principle of physiological reasoning, and from what he calls Experientia Literata. The function of the
positive spirit of his system. Theological questions, which had tortured the minds of generations, are by him relegated from the province of reason to that of faith. Even reason must be restrained from striving after ultimate truth; it is one of the errors of the human intellect that it will not rest in general principles, but must push its investigations deeper. Experience and observation are the only remedies against prejudice and error. Into questions of metaphysics, as commonly understood, Bacon can hardly be said to have entered, but a long line of thinkers have drawn inspiration from him, and it is not without justice that he has been looked upon as the originator and guiding spirit of what is known as the empirical school.

Bacon’s Influence.—It is impossible within our limits to do more than indicate the influence which Bacon’s views have had on subsequent thinkers. The most valuable and complete discussion of the subject is contained in T. Fowler’s edition of the Novum Organum (introd. § 44). It is there argued that, both in philosophy and in natural science, Bacon’s influence was immediate and lasting. Under the former head it is pointed out (i.) that the fundamental principle of Locke’s Essay, that all our ideas are product of sensation and reflection, is briefly stated in the first paragraph of the Novum Organum, and (ii.) that the atmosphere of that treatise is characteristic of the Essay. Bacon, therefore, regarded by many as the father of what is most characteristic in English psychological speculation. As he himself said, he “rang the bell which called the wits-together.” In the sphere of ethics he is similarly regarded as a forerunner of the empirical method. The spirit of the De Augmentis (bk. vii.) and the inductive method which is discussed in the Novum Organum are at the root of all theories which have constructed a moral code by an inductive examination of human consciousness and the results of actions. Among such theories utilitarianism especially is the natural result of the application to the phenomenon of conduct of the Baconian experimental method. In this connexion, however, it is important to notice that Hobbes, who had been Bacon’s secretary, makes no mention of Baconian induction, nor does he in any of his works make any critical reference to Bacon himself. It would, therefore, appear that Bacon’s influence was not immediate.

In the sphere of natural science, Bacon’s importance is attested by the numerous references to his work by a number of the principal scientists, not only English, but French, German and Italian. Fowler (op. cit.) has collected from Descartes, Gassendi, S. Sorbire, Jean Baptiste du Hamel, quotations which show how highly Bacon was regarded by the leaders of the new scientific movement. Sorbire, who was by no means partial to things English, definitely speaks of him as “celui qui a le plus puissamment sollicité les intérêts de la physique, et excité le monde à faire des expériences” (Relation d’un voyage en Angleterre, Cologne, 1666, pp. 63-64). It was, however, Voltaire and the encyclopaedists who raised Bacon to the pinnacle of his fame in France, and hailed him as “le père de la philosophie expérimentale” (Lettres sur les Anglais). Condillac, in the same spirit, says of him, “personne n’a mieux connu que lui la cause de nos erreurs.” So the Encyclopédie, besides giving a eulogistic article “Baconisme,” speaks of him (in d’Alembert’s preliminary discourse) as “le plus grand, le plus universel, et le plus éloquent des philosophes.” Among other writers, Leibnitz and Huygens give testimony which is the more valuable as being critical. Leibnitz calls Bacon as “divini ingenii vir,” and, like several other German authors, classed him with Campanella; Huygens refers to his “bonnes méthodes.” If, however, we are to attach weight to English writers of the latter half of the 17th century, we shall find that one of Bacon’s greatest achievements was the impetus given by his New Atlantis to the foundation of the Royal Society (q.v.). Dr Thomas Sprat (1635-1713), bishop of Rochester and first historian of the society, says that Bacon of all others “had the true imagination of the whole extent” of the enterprise, and that in his works are to be found the best arguments for the experimental method of natural philosophy (Hist. of the Royal Society, pp. 35-36, and Thomas Tenison’s Baconiana, pp. 264-266). In this connexion reference should be made also to Cowley’s Ode to the Royal Society, and to Dr John Wallis’s remarks in Hearne’s Preface to P. Langlois’s Chronicle (appendix, num. xi.). Joseph Glanvill, in his Scepticus Sceptri (1665), says, “Solomon’s house in the New Atlantis was a prophetic scheme of the Royal Society”; and Henry Oldenburg (c. 1615-1677), one of the first secretaries of the society, speaks of the new eagerness to obtain scientific data as “a work begun by the single care and conduct of the excellent Lord Verulam.” Boyle, in whose works there are frequent eulogistic references to Bacon, regarded himself as a disciple and was indeed known as a second Bacon. The predominating influence of Bacon’s philosophy is thus clearly established in the generation which succeeded his own. There is abundant evidence to show that in the universities of Oxford and Cambridge (especially the latter) the new spirit had already modified the old curricula. Bacon has frequently been disparaged on the ground that his name is not mentioned by Sir Isaac Newton. It can be shown, however, that Newton was not ignorant of Bacon’s works, and Dr Fowler explains his silence with regard to them on three grounds: (1) that Bacon’s reputation was so well established that any definite mention was unnecessary, (2) that it was not customary at the time to enter into Baconian controversy and recent writers, and (3) that Newton’s genius was so strongly mathematical (whereas Bacon’s great weakness was in mathematics) that he had no special reason to refer to Bacon’s experimental principles.

If the foregoing examples are held sufficient to establish the influence of Bacon on the intellectual development of his immediate successors, it follows that the whole trend of typically English thought, not only in natural science, but also in mental, moral and political philosophy, is the logical fulfilment of Baconian principles. He argued against the tyranny of authority, the vagaries of unfettered imagination and the academic aims of impractical dialectic; the vital energy and the reasoned optimism of his language entirely outweigh the fact that his contributions to the stock of actual scientific knowledge were practically inconsiderable. It may be freely admitted that in the domain of logic there is nothing in the Organum that has not been more instructively analysed either by Aristotle himself or in modern works; at the same time, there is probably no work to be found which has had a larger influence on modern philosophic study. Its terse, epigrammatic phrases sink into the fibre of the mind, and are a healthy warning against crude, immature generalization.

While, therefore, it is a profound mistake to regard Bacon as a great constructive philosopher, or even as a lonely pioneer of modern thought, it is quite unfair to speak of him as a trier. His great work consists in the fact that he summed up the faults which the widening of knowledge had disclosed in medieval thought, and in this sense he stands high among those who were in many parts of 16th-century Europe striving towards a new intellectual activity.

BIBLIOGRAPHY. Editions.—The classical edition is that of R. B. H. Hutton (Oxford, 1878; ed. 1883); J. English, ed. 1864); D. J. Hooker, ed. 1895 (vol. 1-iiii philosophical writings; i-v., translations; vi-vii., literary and professional works). B. Montagu’s edition (17 vols., 1825-1834) is full but unscholarly. An extremely useful reprint of the philosophical works (with a few minor corrections), based on the first Ellis-Speeding edition, was published by J. M. Robertson (London, 1905); besides the original introductions, it contains a useful summary by the editor of the most important problems of Bacon’s life and thought. Numerous cheap editions have lately been published, e.g. in the “World’s Classics” (1901), and “New Universal Library” series (1905); Sidney Lee, English Works of Francis Bacon (London, 1905).

Of particular works there are numerous editions in all the chief languages. The following is the most important:—T. Fowler, Novum Organum (Oxford, 1878; ed. 1889), with notes, full introduction on Bacon’s philosophy in all its relations, and a most valuable bibliography. This superseded the edition of G. K. Chesterton (Oxford, 1856). The Essays have been edited more commonly, e.g. by H. Ellis (1870), the following editions may be mentioned:—Archbishop Whately (6th ed., 1864); W. Aldis Wright (London, 1862); F. Storr and Gibson (London, 1886); E. A. Abbott (London, 1879); John Buchan (London, 1879); A. S. West (Cambridge, 1897); W. Evans (Edinburgh, 1897). A facsimile reprint of the 1st edition was published in New York (1904). Advancement of Learning:—W. Aldis
BACON, J.—BACON, L.

For the Bacon-Shakespeare controversy see *Shakespeare, Personalities* by R. A.; J. M. M.

BACON, JOHN (1740–1799). British sculptor, was born in Southwark on the 24th of November 1740, the son of Thomas Bacon, a cloth-worker, whose forefathers possessed a considerable estate in Somersetshire. At the age of fourteen he was bound apprentice in Mr Crispe's manufactury of porcelain at Lambeth, where he was at first employed in painting the small ornamental pieces of china, but by his great skill in moulding he soon attained the character of a successful modeller to the work. While engaged in the porcelain works he observed the habits of the models executed by different sculptors of eminence, which were sent to be burned at an adjoining pottery, determined the direction of his genius; he devoted himself to the imitation of them with so much success that in 1758 a small figure of Peace sent by him to the Society for the Encouragement of Arts received a prize, and the highest premiums by that society were adjudged to him nine times between the years 1763 and 1776. During his apprenticeship he also improved the method of working statues in artificial stone, an art which he afterwards carried to perfection. Bacon first attempted working in marble about the year 1763, and during the course of his early efforts in this art was led to improve the method of transferring the form of the model to the marble (technically "getting out the points") by the invention of a more perfect instrument for the purpose. This instrument possessed many advantages above those formerly employed; it was more exact, took a correct impression in every part, and was consequently more commodious, and could be used upon either the model or the marble. In the year 1769 he was adjudged the first gold medal for sculpture given by the Royal Academy, his work being a bas-relief representing the escape of Aeneas from Troy. In 1770 he exhibited a figure of Mars, which gained him the gold medal of the Society of Arts and his election as A.R.A. As a consequence of this success he was engaged to execute a bust of George III., intended for Christ Church, Oxford. He secured the king's favour and retained it throughout life. Considerable jealousy was entertained against him by other sculptors, and he was commonly charged with ignorance of classic style. This charge he repelled by the execution of a noble head of Jupiter Tonans, and many of his emblematic figures are in perfect classical taste. He died on the 4th of August 1799 and was buried in Whitfield's Tabernacle. His various productions which may be studied in St Paul's cathedral, London, Christ Church and Pembroke College, Oxford, the Abbey church, Bath, and Bristol cathedral, give ample testimony to his powers. Perhaps his best works are to be found among the monuments in Westminster Abbey.

BACON, LEONARD (1802–1881). American Congregational preacher and writer, was born in Detroit, Michigan, on the 10th of February 1802, the son of David Bacon (1771–1871), missionary among the Indians in Michigan and founder of the town of Tallmadge, Ohio. The son prepared for college at the Hartford (Conn.) grammar school, graduated at Yale in 1820 and at the Andover Theological Seminary in 1823, and from 1825 until his death on the 24th of December 1881 was pastor of the First Church (Congregational) in New Haven, Connecticut, occupying a pulpit which was one of the most conspicuous in New England, and which had been rendered famous by his predecessors, Moses Stuart and Nathaniel W. Taylor. In 1866, however, though he was never dismissed by a council from his connexion with that church, he gave up the active pastoral. He was, from 1826 to 1828, an editor of the *Christian Spectator* (New Haven); was one of the founders (1843) of the *New Englander* (later the *Yale Review*); founded in 1848 with Dr R. S. Storrs, Joshua Leavitt, Dr Joseph P. Thompson and Henry C. Bowen, primarily to combat slavery extension, the *Independent*, of which he was an editor until 1863; and was acting professor of didactic theology in the theological department of Yale University from 1866 to 1871, and lecturer on church polity and American church history from 1871 until his death. Gradually, after taking up his pastorate, he gained greater and greater influence in his denomination, until he came to be regarded as perhaps the most prominent Congregationalist of his time, and was sometimes popularly referred to as "The Congregational Foé of New England." In all the heated theological controversies of the day, particularly the long and bitter one concerning the views put forward by Dr Horace Bushnell, he was conspicuous, using his influence to bring about harmony, and in the councils of the Congregational churches, over two of which, the Brooklyn councils of 1874 and 1876, he presided as moderator, he manifested great ability both as a debater and as a parliamentarian. In his own theological views he was broad-minded and an advocate of liberal orthodoxy. In all matters concerning the welfare of his community or the nation, moreover, he took a deep and constant interest, and was particularly identified with the temperance and anti-slavery movements, his services to the latter constituting probably the most important work of his life. In this, as in most other controversies, he took a moderate course, condemning the apologists and defenders of slavery on the one hand and the Garrisonian extremists on the other. His *Slavery Discussed in Occasional Essays from 1833 to 1846* exercised considerable influence upon Abraham Lincoln, and in this book appears the sentence, which, as rephrased by Lincoln, was widely quoted: "If that form of government, that system of social order is not wrong—if those laws of the Southern States are not wrong, then what is it, and is what it is, not wrong—nothing is wrong." He was early attracted to the study of the ecclesiastical history of New England and was frequently called upon to deliver commemorative addresses, some of which were published in book and pamphlet form. Of these, his *Thirteen Historical Discourses* (1839), dealing with the history of New Haven, and his *Four Commemorative Discourses* (1866) may be especially mentioned. The most important of his historical works, however, is his *Genesis of the New England Churches* (1874). He published *A Manual for Young Church Members* (1833); edited, with a biography, the *Select Practical Writings of Richard Baxter* (1831); and was the author of a number of hymns, the best-known of which is the one beginning, "O God, beneath Thy guiding hand..." There is no good biography, but there is much biographical material in the commemorative volume issued by his congregation, *Leonard Bacon, Pastor of the First Church in New Haven* (New Haven, 1882), and there is a good sketch in William Walker's *Ten New England Leaders* (New York, 1901).
Leonard Bacon’s sister Delia Bacon (1811–1859), born in Tallmadge, Ohio, on the 2nd of February 1841, was a teacher in schools in Connecticut, New Jersey, and New York, and then, until about 1842, conducted a female seminary in the city of Boston, devised by herself, classes for women in literature and history. She wrote Tales of the Parisians (1831), The Bride of Fort Edward (1839), based on the story of Jane McCrea, frankly in blank verse, and The Philosophy of the Plays of Shakespeare Unfolded (1837), for which alone she is remembered. This book, in the preparation of which she spent several years in study in England, where she was befriended by Thomas Carlyle and especially by Nathaniel Hawthorne, was intended to prove that the plays attributed to Shakespeare were written by a coterie of men, including Francis Bacon, Sir Walter Raleigh and Edmund Spenser, for the purpose of inculcating a philosophic system, for which they felt that they themselves could not afford to assume the responsibility. This system she professed to discover beneath the superficial text of the plays. Her devotion to this one idea, as Hawthorne says, “had thrown her off her balance,” and while she was in England she lost her mind entirely. She died in Hartford, Connecticut, on the 2nd of September 1859.

There is a biography by her nephew, Theodore Bacon, Delia Bacon (New York, 1888), and an appreciative chapter, “Recollections of a Gifted Woman,” in Nathaniel Hawthorne’s Our Old Home (Boston, 1863).

Leonard Bacon’s son Leonard Woolsey Bacon (1830–1907), graduated at Yale in 1850, was pastor of various Congregational and Presbyterian churches, and published Church Papers (1876); A Life Worth Living: Life of Emily Bliss Gould (1878); Trenies and Polonies and Sundry Essays in Church History (1893); History of American Christianity (1893); and The Congregationalists (1904).

**BACON, SIR NICHOLAS** (1509–1579), lord keeper of the great seal of England during the reign of Queen Elizabeth, was the second son of Robert Bacon of Drinkstone, Suffolk, and was born at Chislehurst. He was educated at Corpus Christi College, Cambridge, graduating B.A. in 1527, and afterwards spent some time in Paris. Returning to England and entered Gray’s Inn, he was called to the bar in 1533, and four years later began his public life as solicitor of the court of augmentations. Quickly becoming a person of importance he obtained a number of estates, principally in the eastern counties, after the dissolution of the monasteries, and in 1545 became member of parliament for Dartmouth. In 1546 he was made attorney of the court of wards and livery, an office of both honour and profit; in 1550 became a bencher and in 1553 treasurer of Gray’s Inn. Although his sympathies were with the Protestants, he retained his office in the court of wards during Mary’s reign, but an order was issued to prevent him from leaving England. The important period in Bacon’s life began with the accession of Elizabeth in 1558. Owning largely to his long and close friendship with Sir William Cecil, afterwards Lord Burghley, his brother-in-law, he was appointed lord keeper of the great seal in December of this year, and was soon afterwards made a privy councillor and a knight. He was instrumental in securing the archbishopric of Canterbury for his friend Matthew Parker, and in his official capacity presided over the House of Lords when Elizabeth opened her first parliament. In opposition to Cecil, he objected to the policy of making war on France in the interests of the enemies of Mary queen of Scots, on the ground of the poverty of England; but afterwards favoured a closer union with foreign Protestants, and seemed quite alive to the danger to his country from the allied and aggressive religious policy of France and Scotland. In 1559 he was authorized to exercise the full jurisdiction of lord chancellor. In 1560 he fell temporarily into the royal disfavour and was dismissed from court, because Elizabeth suspected he was concerned in the publication of a pamphlet, “A Declaration of the Succession of the Crown Imperial of England,” written by John Hales (q.v.), and favouring the claim of Lady Catherine Grey to the English throne. Bacon’s innocence having been admitted he was restored to favour, and replied to a writing by Sir Anthony Browne, who had again asserted the rights of the house of Suffolk to which Lady Catherine belonged. He thoroughly distrusted Mary queen of Scots; objected to the project to marry her to the Duke of Anjou; and the distrust of the Roman Catholics and the French was increased by the massacre of St. Bartholomew. As a loyal English churchman he was ceaselessly interested in ecclesiastical matters, and made suggestions for the better observation of doctrine and discipline in the church.

He died in London on the 20th of February 1579 and was buried in St. Paul’s cathedral, his death calling forth many tributes to his memory. He was an eloquent speaker, a learned lawyer, a generous friend; and his interest in education led him to make several gifts and bequests for educational purposes, including the foundation of a free grammar school at Redgrave. His figure was very corpulent and ungainly. Elizabeth visited him several times at Gorhambury, and had previously visited him at Redgrave. He was twice married and by his first wife, Jane, had three sons and three daughters. His second wife was Anne (d. 1610), daughter of Sir Anthony Cooke, by whom he had two sons. Bacon’s eldest son, Nicholas (c. 1540–1624), was member of parliament for the county of Suffolk and in 1611 was created premier baronet of England. This baronetcy is still held by his descendants. His second and third sons, Nathaniel (c. 1540–1622) and Edward (c. 1559–1621), both took some part in public life, and through his daughter, Anne, Nathaniel was an ancestor of the margrasses Townshend. His sons by his second wife were Anthony (1558–1601), a diplomatist of some repute, and the illustrious Francis Bacon (q.v.).

**BACON, ROGER** (c. 1214–c. 1294), English philosopher and man of science, was born near Ilchester in Somerset. His family appears to have been in good circumstances, but in the stormy reign of Henry III. their property was despoiled and several members of the family were driven into exile. Roger completed his studies at Oxford, though not, as current traditions assert, at Merton or at Brasenose, neither of which had then been founded. His abilities were speedily recognized by his contemporaries, and he enjoyed the friendship of such eminent men as Adam de Marisco and Robert Grosseteste, bishop of Lincoln.

Very little is known of Bacon’s life at Oxford; it is said he took orders in 1233, and this is not improbable. In the following year, or perhaps later, he crossed over to France and studied at the university of Paris, then the centre of intellectual life in Europe. The two great orders, Francisians and Dominicans, were in the vigour of youth, and had already begun to take the lead in theological discussion. Alexander of Hales was the oracle of the Franciscans, while the rival order rejoiced in Albertus Magnus and Thomas Aquinas.

The scientific training which Bacon had received, mainly from the study of the Arab writers, showed him the manifold defects in the systems reared by these doctors. Aristotle was known but in part, and that part was rendered well-nigh unintelligible through the vileness of the translations; yet not one of those professors would learn Greek. The Scriptures read, if at all, in the erroneous versions were being deserted for the Sentences of Peter Lombard. Physical science, if there was anything deserving that name, was cultivated, not by experiment in the Aristotelian way, but by arguments deduced from premises resting on authority or custom. Everywhere there was a show of knowledge concealing fundamental ignorance. Bacon, accordingly, withdrew from the scholastic routine and devoted himself to languages and experimental research. The only teacher whom he respected was a certain Petrus de Mahaneurca Picardus, or of Picardy, probably identical with a certain mathematician, Petrus Peregrinus of Picardy, who is perhaps the author of a MS. treatise, De Magnete, contained in the Bibliothèque Impériale at Paris. The contrast between the obscurity of such a man and...
the fame enjoyed by the fluent young doctors roused Bacon's indignation. In the *Opus Majus* and *Opus Terturn* he pours forth a violent tirade against Alexander of Hales, and another professor, not mentioned by name, but spoken of as alive, and blamed even more severely than Alexander. This anonymous writer, he says, acquired his learning by teaching others, and adopted a dogmatic tone, which has caused him to be received at Paris with applause as the equal of Aristotle, Avicenna, or Averroes.

Bacon, during his stay in Paris, acquired considerable renown. He took the degree of doctor of theology, and seems to have received the complimentary title *doctor mirabilis*. In 1250 he was again at Oxford, and probably about this time entered the Franciscan order. His fame spread at Oxford, though it was mingled with suspicions of his dealings in the black arts and with some doubts of his orthodoxy. About 1257, Bonaventura, general of the order, interdicted his lectures at Oxford, and commanded him to place himself under the superintendence of the body at Paris. Here for ten years he remained under supervision, suffering great privations and strictly prohibited from writing anything for publication. But his fame had reached the ears of the papal legate in England, Guy de Foulques, who in 1265 became pope as Clement IV. In the following year he wrote to Bacon, ordering him notwithstanding any injunctions from Oxford to come over to him and to bring with him the sciences which he had already asked of him when papal legate. Bacon, whose previous writings had been mostly scattered tracts, *capitula quaedam*, took fresh courage from this command of the pope. He set at naught the jealousy of his superiors and brother friars, and despite the want of funds, instruments, materials for copying and skilled copyists, completed in about eighteen months three large treatises, the *Opus Majus*, *Opus Minus* and *Opus Terturn*, which, with some other tracts, were despatched to the pope. We do not know what opinion Clement formed of them, but before his death he seems to have bestowed himself on Bacon's behalf, for in 1268 the latter was permitted to return to Oxford. Here he continued his labours in experimental science and also in the composition of complete treatises. The works sent to Clement he regarded as preliminaries, laying down principles which were afterwards to be applied to the sciences. The first part of an encyclopaedic work probably remains to us in the *Compendium Studii Philosophiae* (1271). In this work Bacon makes a vehement attack upon the ignorance and vices of the clergy and monks, and generally upon the insufficiency of the existing studies. In 1278 his books were condemned by Jerome of Fossa, canon of the Franciscan order at the court of Pope Nicholas IV, and he himself was thrown into prison for fourteen years. During this time, it is said, he wrote the small tract *De Retardandis Senectutis Accidentibus*, but this is merely a tradition. In 1292, as appears from what is probably his latest composition, the *Compendium Studii Theologiae*, he was again at liberty. The exact time of his death cannot be determined; 1294 is probably as accurate a date as can be fixed upon.

*Works and Editions.*—Leland said that it is easier to collect the leaves of the Sibyl than the titles of the works written by Roger Bacon; and though the labour has been somewhat lightened by the publications of Brewer and Charles, referred to below, it is no easy matter even now to form an accurate idea of his actual productions. An enormous number of MSS. are known to exist in British and French libraries, and probably not all have yet been discovered. Many are transcriptions of works or portions of works already published and, therefore, require no notice.1

The works hitherto printed (neglecting reprints) are the following:—(1) *Speculum Alchimiae* (1541) — translated into English (1597); French, *A Poisson* (1800); (2) *De Mirabilis Potestate Artis et Naturae* (1542) — English translation (1569); (3) *Libellus de Retardandis Senectutis Accidentibus* (1590) — translated as the "Cure of Old Age," by Richard Brown (London, 1868); (4) *Sanioris Medicinae Magistri D. Rogeri Baconis Anglici de Arte Chymiae Scripta* (Frankfort, 1603) — a collection of small tracts containing *Excerpta de Libro Avicennae de Anima, Breve Breviarium, Verbem Abbreviatis*, Secretum Secretorum, Tractatus Trium Verborum, and *Speculum Secretorum*; (5) *Perspectiva* (1614), which is the fifth part of the *Opus Majus*; (6) *Specula Mathematica*, which is the fourth part of the same; (7) *Opus Majus ad Clementem IV.* ed. by S. Jebb (1733) and J. H. Bridges (London, 1897); (8) *Opera hactenus Inedita*, by J. S. Brewer (1850), containing the *Opus Terturn*, *Opus Minus*, *Compendium Studii Philosophiae* and the *De Secretis Operibus Naturae*; (9) *De Morali Philosophia* (Dublin, 1860, see below); (10) *The Greek Grammar of R. Bacon and a Fragment of his Hebrew Grammar*, edited with introduction and notes by E. S. Nolan and S. A. Hirsch (1902); (11) *Metaphysica Fratris Rogeri*, edited by H. W. Brewer, and the works of the *Breviarium* (1905); (12) *Opera hactenus Inedita*, by Robert Steele (1909).

How these works stand related to one another can only be determined by internal evidence. The smaller works, chiefly on alchemy, are unimportant, and the dates of their composition cannot be ascertained. It is known that before the *Opus Majus* Bacon had already written some tracts, among which an unpublished work, *Comptus Naturalum*, on chronology, belongs probably to the year 1263; while, if the dedication of the *De Secretis Operibus* be authentic, that short treatise must have been composed before 1240. It is, however, with the *Opus Majus* that Bacon's real activity begins. It has been called by Whewell at once the Encyclopaedia and the Organum of the 13th century.

Part I. (pp. 1–22), which is sometimes designated *De Utilitate Scientiarum*, treats of the four *officina*, or causes of error. These are, authority, custom, the opinion of the unskilled many, and the concealment of real ignorance with pretence of knowledge. The last error is the most dangerous, and is, in a sense, the cause of all the others. The *officinala* have sometimes been looked upon as an anticipation of Francis Bacon's *Idola*, but the two classifications differ widely from each other. In the summary of this part contained in the *Opus Terturn*, Bacon shows very clearly his perception of the unity of science and the necessity of its encyclopaedic treatment.

Part II. (pp. 23–43) treats of the relation between philosophy and theology. All true wisdom is contained in the Scriptures, at least implicitly; and the true end of philosophy is to rise from the imperfect knowledge of created things to a knowledge of the Creator. Ancient philosophers, who had not the Scriptures, received direct illumination from God, and only thus can the brilliant results attained by them be accounted for.

Part III. (pp. 44–57) treats of the utility of grammar, and the necessity of a true linguistic science for the adequate comprehension either of the Scriptures or of books on philosophy.

1 The more important MSS. are:—(1) The extensice work on the fundamental notions of physics, called *Communita Naturalium*, which is found in the Mozarab library at Paris, in the British Museum, and in the Bodleian and University College libraries at Oxford; (2) on the fundamental notions of mathematics, *De Compendiis Mathematicis*, of which there is a facsimile at part in the Bodleian; (3) *Baconis Physica*, contained among the additional MSS. in the British Museum; (4) the fragment called *Quinta Pars Compendii Theologiae*, in the British Museum; (5) the *Compendium Studii Theologiae*, in the British Museum; (6) the logical fragments, such as the *Summulae Dialecticae*, in the Bodleian, and the glosses upon Aristotle's physics and metaphysics in the library at Amiens. See Little, *The Grey Friars in Oxford* (1892).

2 At the close of the Verb. *Aber* is a curious note, concluding with the words, "ipsa Rogeri fuit disciplina fratris Alberti."
The necessity of accurate acquaintance with any foreign language and of obtaining good texts, is a subject Bacon is never weary of descending upon. A translator should know thoroughly the language he is translating from, the language into which he is translating, and the subject of which the book treats.

Part IV. (pp. 57-255) contains an elaborate treatise on mathematics, "the alphabet of philosophy," maintaining that all the sciences rest ultimately on mathematics, and progress only when their facts can be subsumed under mathematical principles. This fruitful thought he illustrates by showing how geometry is applied to the action of natural bodies, and demonstrating by geometrical figures certain laws of physical forces. He also shows how his method may be used to determine some curious and long-discussed problems, such as the light of the stars, the ebb and flow of the tide, the motion of the balance. He then proceeds to adduce elaborate and sometimes slightly grotesque reasons tending to prove that mathematical knowledge is essential in theology, and closes this section of his work with two comprehensive sketches of geography and astronomy. That on geography is particularly good, and is interesting as having been read by Columbus, who lighted on it in Petrus de Alliaio's Imagis Vindi, and was strongly influenced by its reasoning.

Part V. (pp. 256-357) treats of perspective. This was the part of his work on which Bacon most prided himself, and in it, we may add, he seems to owe most to the Arab writers Kindi and Alhazen. The treatise opens with an able sketch of psychology, founded upon, but in some important respects varying from, Aristotle's De Anima. The anatomy of the eye is next described; this is done well and evidently at first hand, though the functions of the parts are not given with complete accuracy. Many other points of physiological optics are touched on, in general erroneously. Bacon then discusses vision in a right line, the laws of reflection and refraction, and the construction of mirrors and lenses. In this part of the work, as in the preceding, his reasoning depends essentially upon his peculiar view of natural agents and their activities. His fundamental physical maxims are matter and force; the latter he calls virtus, species, imago agentis, and by numberless other names. Change, or any natural phenomenon, is produced by the impression of a virtus or species on matter—the result being the thing known. Physical action is, therefore, impression, or transmission of force in lines, and must accordingly be explained geometrically. This view of nature Bacon considered fundamental, and it lies, indeed, at the root of his whole philosophy. To the short notices of it given in the 4th and 5th parts of the Opus Majus, he subjoined two, or perhaps three, extended accounts of it. We possess at least one of these in the tract De Multiplicatione Specierum, printed as part of the Opus Majus by Jebb (pp. 358-444). We cannot do more than refer to Charles for discussions as to how this theory of nature is connected with the metaphysical problems of force and matter, with the logical doctrine of universals, and in general with Bacon's theory of knowledge.

Part VI. (pp. 444-477) treats of experimental science, domina omnium scientiarum. There are two methods of knowledge: the one by argument, the other by experience. Mere argument is never sufficient; it may decide a question, but gives no satisfaction or certainty to the mind, which can only be convinced by immediate inspection or intuition. Now this is what experience gives. But experience is of two sorts, external and internal; the first is that usually called experiment, but it can give no complete knowledge even of corporeal things, much less of spiritual. On the other hand, in inner experience the mind is illuminated by the divine truth, and of this supernatural enlightenment there are seven grades.

Experimental science, which in the Opus Terium (p. 46) is distinguished from the speculative sciences and the operative arts in a way that forcibly reminds us of Francis Bacon, is said to have three great prerogatives over all other sciences:—(1) It verifies their conclusions by direct experiment; (2) It discovers truths which they could never reach; (3) It investigates the secrets of nature, and opens to us a knowledge of past and future. As an instance of his method, Bacon gives an investigation into the nature and cause of the rainbow, which is really a very fine specimen of inductive research.

The seventh part of the Opus Majus (De Morali Philosophia), not given in Jebb's edition, is noticed at considerable length in the Opus Terium (cap. xiv.). Extracts from it are given by Charles (pp. 330-348).

As has been seen, Bacon had no sooner finished this elaborate work than he began to prepare a summary to be sent along with it. Of this summary, or Opus Minor, part has come down and is published in Brewer's Op. Ind. (313-380), from what appears to be the only MS. The work was intended to contain an abstract of the Opus Majus, an account of the principal vices of theology, and treatises on speculative and practical alchemy. At the same time, or immediately after, Bacon began a third work as a preambule to the other two, giving their general scope and aim, but supplementing them in many points. The part of this work, generally called Opus Terium, is printed by Brewer (pp. 1-310), who considers it to be a complete treatise. Charles, however, has given good grounds for supposing that it is merely a preface, and that the work went on to discuss grammar, logic (which Bacon thought of little service, as reasoning was innate), mathematics, general physics, metaphysics and moral philosophy. He founds his argument mainly on passages in the Communia Naturae, which indeed prove distinctly that it was sent to Clement, and cannot, therefore, form part of the Compendium, as Brewer seems to think. It must be confessed, however, that nothing can well be more confusing than the references in Bacon's works, and it seems well-nigh hopeless to attempt a complete arrangement of them until the texts have been collated and carefully printed.

All these large works Bacon appears to have looked on as preliminaries, introductions, leading to a great work which should embrace the principles of all the sciences. This great work, which is perhaps the frequently-quoted Liber Sex Scieniarius (he, and a few fragments still indicate its outline. First appears to have come the treatise now called Compendium Studii Philosophiae (Brewer pp. 332-359), containing an account of the causes of error, and then entering at length upon grammar. After that, apparently, logic was to be treated; then, possibly, mathematics and physics; then speculative alchemy and experimental science. It is, however, very difficult, in the present state of our knowledge of the MSS., to hazard even conjectures as to the contents and nature of this last and most comprehensive work.

Bacon's fame in popular estimation has always rested on his mechanical discoveries. Careful research has shown that very little can with accuracy be ascribed to him. He certainly describes a method of constructing a telescope, but not so as to lead one to conclude that he was in possession of that instrument. Burning-glasses were in common use, and spectacles it does not appear he made, although he was probably acquainted with the principles of their construction. His wonderful predictions (in the De Socrates) must be dimmed by salt; he believed in astrology, in the doctrine of signatures, and in the philosopher's stone, and knew that the circle had been squared. For his work in connexion with gunpowder, the invention of which has been claimed for him on the ground of a passage in his De mirabilibus potentate artis et naturae, see Gunpowder.

Summary.—The 17th century, an age peculiarly rich in great men, produced few, if any, who can take higher rank than Roger Bacon. He is in very every worthy to be placed beside Albertus Magnus, Bonaventura, and Thomas Aquinas. These had an infinitely wider renown in their day, but modern criticism has restored the balance in his favour, and is even in danger of earring in the opposite direction. Bacon, it is now said, was not appreciated by his age because he was in advance of it; he is no schoolman, but a modern thinker, whose conceptions of science are more just and clear than are even those of his more celebrated namesake. In this view there is certainly some truth, but it is much exaggerated. As a general rule, no man can be completely disovered from his national antecedents and

1 See Düring, Kritishe Ges. d. Phil. 192, 249-251.
surroundings, and Bacon is not an exception. Those who take up such an extreme position regarding his merits have known too little of the state of contemporary science, and have limited their comparison to the works of the scholastic theologians. We never find in Bacon himself any consciousness of originality; he is rather a keen and systematic thinker, working in a well-beaten track, from which his contemporaries were being dawned by theology and metaphysics.

**BIBLIOGRAPHY.**—The best work on Roger Bacon is perhaps that of E. Charles, *Bacon, Roger, sa vie, ses œuvres, ses doctrines d’après les textes inédits* (1861). Against the somewhat enthusiastic estimate of modern interpretation given in this work, are the following articles in *Bacon, Roger, Eine Monographie* (Augsburg, 1873); K. Werner, *Die Psychol. des Roger Bacon et Die Kosmologie des Roger Bacon* (Vienna, 1879); S. A. Hirsch, *Early English Hebraists* (1899); and *Roger Bacon and his contemporaries* (Jena, 1906). The new matter contained in the publications of Charles and Brewer was summarized by H. Siebert, *Bacon: Inaugural Dissertation* (Marburg, 1861). Cf. also J. K. Ingram, *On the Opus Majus of Bacon* (Dublin, 1886); *Cousin, Fragments phil. du moyen âge* (reprinted from *Journal des avanç*, 1898); E. Saissert, *Préc.-curseurs et disciples de Descartes*, pp. 1-58 (reprinted from *Revue de deux mondes*, 1861); K. Prantl, *Gesch. der Logik*, iii. 120-129 (a severe criticism of Bacon’s logical doctrines); H. de *Bacon, praktische Philosophie* (Jena, 1881); K. Pohl, *Das Verhältniss d. Philis, zur Thel. bei Roger Bacon* (Neustrelitz, 1893); articles in *Westminster Review*, lxxxi. 1 and 512; A. Parrot, *Roger Bacon et ses contemporains* (1894); E. Fugelö, *Roger Bacon’s Stellung in d. German. Geschichte der Philosophie*, Leipzig, 1895; and *Roger Bacon* (a popular study). For the legendary see *Famous Historie of Fryer Bacon* (London, 1615), *in Thoms, Early Prose Romances*, iii.; R. Greene’s *Frier Bacon and Frier Bungay* (1587 or 1588), and in *Publications of the Percy Society*, vol. iv. 384, for Bacon’s *Brazen Head’s Prophesie* (1604). For Bacon as a classical scholar see J. E. Sandys, *Hist. of Class. Schol. (2nd ed., 1906)*, cxxxi.

**BACON** (through the O. Fr. *bacou*, Low Lat. *bacou*, from a Teutonic word cognate with *back,* e.g. O. H. Ger. *pacho*, M. H. *bacou*, buttock, fitch of bacon, the flesh of the sides and back of the hog, *bacou-le*, bacon, *bacou-en*, salted, dried, pickling bacon).

**BACONTORPE [BACON, BACO, BACONUTS]**, JOHN (d. 1346), known as “the Resolute Doctor,” a learned Carmelite monk, was born at Baconthorpe in Norfolk. He seems to have been the grandson of Roger Bacon (Brit. Mus. Add. MS. 19. 116). Brought up at the Carmelite monastery of Blakeney, near Walsingham, he studied at Oxford and Paris, where he was known as “Princes” of the Avroisians. Renan, however, says that he merely tried to justify Arverrois against the charge of heterodoxy. In 1329 he was chosen twenty-third provincial of the English Carmelites. He appears to have anticipated Wycliffe in advocating the subordination of the clergy to the king. In 1333 he was sent for to Rome, where, we are told, he first maintained the pope’s authority in cases of divorce; but this opinion he retracted. He died in London in 1346. His chief work, *Doctoris resoluti Joannis Bacoconis Anglici Carmelianae radiationissimi opus super quattuor sententiarum libris* (published 1510), has passed through several editions. Nearly three centuries later, it was still studied at Padua, the last home of Avroisian, and Lucilio vanini speaks of him with great veneration.

**BACSANYI, JANOS** (1763-1845), Hungarian poet, was born at Tapolca on the 11th of May 1763. In 1785 he published his first work, a patriotic poem, *The Valour of the Magyars*. In the same year he obtained a situation as clerk in the treasury at Kaschau, and there, in conjunction with other two Hungarian patriots, edited the *Magyar Museum*, which was suppressed by the government in 1783. In 1789, during his first year of deprival of his clericalship, and in 1794, having taken part in the conspiracy of Bishop Martinovich, he was thrown into the state prison of the Spielberg, near Brunn, where he remained for two years. After his release he took a considerable share in the *Magyar Minerva*, a literary review, and then proceeded to Vienna, where he obtained a post in the bank, and married. In 1809 he translated Napoleon’s proclamation to the Magyars, and, in consequence of this anti-Austrian act, had to take refuge in Paris. After the fall of Napoleon he was given up to the Austrians, who allowed him to reside at Linz, on condition of never leaving that city. He published a collection of poems at Pest, 1827 (2nd ed., Buda, 1835), and also edited the poetical works of Anyos and Faludi. He died at Linz on the 12th of May 1845.

**BACTERIOLOGY.** The minute organisms which are commonly called “bacteria” are also known popularly under other designations, e.g., *microbes*, “micro-organisms,” “micro-phytes,” “bacilli,” “micrococci.” All these terms, including the usual one of bacteria, are unsatisfactory; for “bacterium,” “bacillus” and “micrococcus” have narrow technical meanings, and the other terms are too vague to be scientific. The most satisfactory designation is that proposed by Nägeli in 1857, namely “schizomyces,” and it is by this term that they are usually known among botanists; the less exact term, however, is also used and is retained in this article since the science is commonly known as “bacteriology.” The first part of this article deals with the general scientific aspects of the subject, while a second part is concerned with the medical aspects.

I. THE STUDY OF BACTERIA

The general advances which have been made in late years in the study of bacteria are clearly brought to mind when we reflect that in the middle of the 19th century these organisms were only known to a few experts and in a few forms as curiosities of the microscope, chiefly interesting for their minuteness and motility. They were then known under the name of “animalcules,” and were confounded with all kinds of other small organisms. At that time nothing was known of their life-history, and one dreamed of their being of importance to man and other living beings, or of their capacity to produce the profound chemical changes with which we are now so familiar. At the present day, however, not only have hundreds of forms or species been described, but our knowledge of their biology has so extended that we have entire laboratories equipped for their study, and large libraries devoted solely to this subject. Furthermore, this branch of science has become so complex that the bacteriological departments of medicine, of agriculture, of sewage, &c., have become more or less separate studies.

The schizomyces or bacteria are minute vegetable organisms devoid of chlorophyll and multiplying by repeated bipartitions. They consist of single cells, which may be spherical, ovoid, oval or cigar-shaped, or filamentous or branched or other aggregates of forms. They are identified by the absence of ordinary sexual reproduction and by the absence of an ordinary nucleus. In the two last-mentioned characters and in their manner of division the bacteria resemble Schizophyceae (Cyanophyceae or blue-green algae), and the two groups of Schizophyceae and Schizomyces are usually united in the class Schizophyta, to indicate the generally received view that most of the typical bacteria have been derived from the Cyanophyceae. Some forms, however, such as “Sarcina,” have their algal analogues in Palmellaceae among the green algae, while Thaxter’s group of Myxobacteriaceae suggests a relationship with the Myxomycetes. The existence of ciliated micrococi together with the formation of endospores—structures not known in the Cyanophyceae—reminds us of the flagellate Protozoa, e.g., *Monas, Chromidina*. Resemblances also exist between the endospores and the spore-formations in the Saccharomyces, and if *Bacillus inflatus, B. ventriculus*, &c., really form more than one spore in the cell, these analogies are strengthened. Schizomyces such as *Cloustridium, Plecomputium*, &c., while the sporiferous cells enlarge, bear out the same argument, and we must not forget that there are extremely minute “yeasts,” easily mistaken for Micrococi, and that yeasts occasionally form only one spore in the cell.

Nor must we overlook the possibility that the endospore-formation in non-motile bacteria more than merely resembles the development of az ygospores in the Conjugatae, and some Ulothrichaceae, if reduced in size, would resemble them. Meyer regards them as chlamydospores, and Klebs as “carpospores” or possibly chlamydospores similar to the endospores of yeast.

1 Gr. βακτρίμοιος, Lat. bacillus, little rod or stick.
The former also looks on the ordinary disjunctive bacterial cell as an oitidium, and it must be admitted that since Brefeld’s discovery of the frequency of minute oitidia and chlamydospores among the fungi, the probability that some so-called bacteria—and this applies especially to the branching forms accepted by some bacteriologists—are merely reduced fungi is increased. Even the curious one-sided growth of certain species which form sheaths and stalks—e.g. Bacterium vermisiforme, B. pediculatum—which can be matched by Algae such as Oocystium, Hydrurus, and some Diatoms. It is clear then that the bacteria are very possibly a heterogeneous group, and in the present state of our knowledge their phylogeny must be considered as very doubtful.

Nearly all bacteria, owing to the absence of chlorophyll, are saprophytic or parasitic forms. Most of them are colourless, but liquid (blood, urine, milk, beer, &c.) containing organic matter, or any solid food-stuff (meat preserves, vegetables, &c.), allowed to stand exposed to the air soon swarms with bacteria, if moisture is present and the temperature not abnormal. Though they occur all over in the air and on the surface of exposed bodies, it is not to be supposed that they are by any means equally distributed, and it is questionable whether the bacteria suspended in the air ever exist in such enormous quantities as were once believed. The evidence to hand shows that on heights and in open country, especially in the north, there may be few or even no Schizomyces detected in the air, and even in towns their distribution varies greatly; sometimes they appear to exist in minute clouds, as it were, with interspaces devoid of any, but in laboratories and closed spaces where their cultivation has been promoted the air may be considerably laden with them. Of course the distribution of bodies so light and small is easily influenced by movements, rain, wind, changes of temperature, &c. As parasites, certain Schizomyces inhabit and prey upon the organs of man and animals in varying degrees, and the conditions for their growth and distribution are then very complex. Plants appear to be less subject to their attacks—possibly, as has been suggested, because the acid fluids of the higher vegetable organs are less suited for the development of Schizomyces; nevertheless some are known to be parasitic on plants. Schizomyces exist in every part of the alimentary canal of animals, except, perhaps, where acid secretions prevail; these are by no means necessarily harmful, though, by destroying the teeth for instance, certain forms may incidentally be the forerunners of damage which they do not directly cause.

Little was known about these extremely minute organisms before 1866. A. van Leeuwenhoek figured bacteria as far back as the 17th century, and O. F. Müller knew several important forms in 1773, while Ehrenberg in 1830 had advanced to the commencement of a scientific separation and grouping of them, and in 1838 had proposed at least sixteen species, distributing them into four genera. Our modern more accurate though still fragmentary knowledge of the forms of Schizomyces, however, dates from F. J. Cohn’s brilliant researches, the chief results of which were published at various periods between 1853 and 1873. Cohn’s classification of the bacteria, published in 1872 and extended in 1875, has in fact dominated the study of these organisms almost ever since. He proceeded in the main on the assumption that the forms of bacteria as met with and described by him are practically constant, at any rate within limits which are not wide: observing that a minute spherical micrococccus or a rod-like bacillus regularly produced similar micrococci and bacilli respectively, he based his classification on what may be considered the constancy of forms which he called species and genera. As to the constancy of form, however, Cohn maintained certain reservations which have been ignored by some of his followers. The fact that Schizomyces produce spores appears to have been discovered by Cohn in 1857, though it was expressed dubiously in 1872; these spores had no doubt been observed previously. In 1876, however, Cohn had seen the spores germinate, and Koch, Brefeld, Pratamowski, van Tiegheim, de Bar and others confirmed the discovery in various species.

The supposed constancy of forms in Cohn’s species and genera received a shock when Lankester in 1873 pointed out that his *Bacterium rubescens* (since named *Beggiosia roseo-persicina*, Zopf) passes through conditions which would have been described by most observers influenced by the current doctrine as so many separate “species” or even “genera”—that in fact forms known as *Bacterium, Micrococcus, Bacillus*, Leptothrix, &c., occur as phases in one life-history. Lister put forth similar ideas about the same time; and Billroth came forward in 1874 with the extravagant view that the various bacteria are only different states of one and the same organism which he called *Coccus-bacteria septica*. From that time the question of the pleomorphism (mutability of shape) of the bacteria has been hotly discussed: but it is now generally agreed that, while a
certain number of forms may show different types of cell during the various phases of the life-history; yet the majority of forms are uniform, showing one type of cell throughout their life-history. The question of species in the bacteria is essentially the same as in other groups of plants; before a form can be placed in a satisfactory classificatory position its whole life-history must be studied, so that all the phases may be known. In the meantime, while various observers were building up our knowledge of the morphology of bacteria, others were laying the foundation of what is known of the relations of these organisms to fermentation and disease—that ancient will-o’-the-wisp "spontaneous generation" being revived by the way. When Pasteur in 1857 showed that the lactic fermentation depends on the presence of an organism, it was already known from the researches of Schwann (1837) and Helmholtz (1843) that fermentation and putrefaction are intimately connected with the presence of organisms derived from the air, and that the preservation of putrescible substances depends on this principle. In 1862 Pasteur placed it beyond reasonable doubt that the ammonical fermentation of urea is due to the action of a minute Schizomycete; in 1864 this was confirmed by van Tieghem, and in 1874 by Cohn, who named the organism Micrococcus costae. Pasteur and Cohn also pointed out that putrefaction is but a special case of fermentation, and before 1872 the doctrines of Pasteur and Cohn were generally accepted by Schizomycetes. Meanwhile two branches of inquiry had arisen, one to speak from the above. In the first place, the ancient question of "spontaneous generation" received fresh impetus from the difficulty of keeping such minute organisms as bacteria from reaching and developing in organic infusions; and, secondly, the long-suspected analogies between the phenomena of fermentation and those of certain diseases again made themselves felt, as both became better understood. Needham in 1745 had declared that heated infusions of organic matter were not deprived of living beings; Spallanzani (1777) had replied that more careful heating and other precautions prevent the appearance of organisms in the fluid. Various experiments by Schwann, Helmholtz, Schultz, Schroeder, Dusch and others led to the refutation, step by step, of the belief that the more minute organisms, and particularly bacteria, arose de novo in the special cases quoted. Nevertheless, instances were adduced where the most careful heating of yolk of egg, milk, hay-infusions, &c., had failed,—the boiled infusions, &c., turning putrid and swarming with bacteria after a few hours. In 1863, repeated and extended such experiments, and paved the way for a complete explanation of the anomaly. Cohn in 1872 published confirmatory results; and it became clear that no putrefaction can take place without bacteria or some other living organism. In the hands of Brefeld, Burdon-Sanderson, de Bary, Tyndall, Roberts, Lister and others, the various links in the chain of evidence grew stronger and stronger, and every case adduced as one of "spontaneous generation" fell to the ground when examined. No case of so-called "spontaneous generation" has withstood rigid investigation; but the discussion contributed to more exact ideas as to the ubiquity, minuteness, and high powers of resistance to physical agents of the spores of Schizomycetes, and led to more exact ideas of antiseptic treatments. Methods were also improved, and the application of some of them to surgery at the hands of Lister, Koch and others has yielded results of the highest value.

Long before any clear ideas as to the relations of Schizomycetes to fermentation and disease were possible, various thinkers at different times had suggested that resemblances existed between the phenomena of certain diseases and those of fermentation, and the idea that a virus or contagium might be something of the nature of a minute organism capable of spreading and reproducing itself had been entertained. Such vague notions began to take more definite shape as the ferment theory of Cagniard de la Tourette (1828), Schwann (1837) and Pasteur made way, especially in the hands of the last-named savant. From about 1870 onwards the "germ theory of disease" has passed into acceptance. P. F. O. Rayer in 1849 and Davaine had observed the bacilli in the blood of animals dead of anthrax (splanic fever), and Pollender discovered them anew in 1855. In 1863, imbued with ideas derived from Pasteur's researches on fermentation, Davaine reinvestigated the matter, and put forth the opinion that the anthrax bacilli caused the splanic fever; this was proved to result from inoculation. Koch in 1876 published his observations on Davaine's bacilli, placed beyond doubt their causal relation to splanic fever, discovered the spores and the saprophytic phase in the life-history of the organism, and cleared up important points in the whole question (figs. 7 and 9). In 1870 Pasteur had proved that a disease of silkworms was due to an organism of the nature of a bacterium; and in 1871 Oertel showed that a Micrococcus already known to exist in diphtheria is intimately concerned in producing that disease. In 1872, therefore, Cohn was already justified in grouping together a number of "pathogenous" Schizomycetes. Thus arose the foundations of the modern "germ theory of disease," and, in the midst of the wildest conjectures and the boldest hypotheses, a number of facts was won, which has since grown, and is growing daily. Some of these, such as fowl-cholera, relapsing fever, and other diseases are now brought definitely within the range of biology, and it is clear that all contagious and infectious diseases are due to the action of bacteria or, in a few cases, to fungi, or to protozoa or other animals.

Other questions of the highest importance have arisen from the foregoing. About 1880 Pasteur first showed that Bacillus anthracis cultivated in chicken broth, with plenty of oxygen and at a temperature of 42–43° C., lost its virulence after a few "generations," and ceased to kill even the mouse; Toussaint and Chauveau confirmed, and others have extended the observations. More remarkable still, animals inoculated with such "attenuated" bacilli proved to be curiously resistant to the deadly effects of subsequent inoculations of the non-attenuated form. In other words, animals vaccinated with the cultivated bacillus showed immunity from disease when reinoculated with the deadly wild form. The questions as to the causes and nature of the changes in the bacillus and in the host, as to the immunity enjoyed by the latter, &c., are of the greatest interest and importance, tuberculosis, and others such as phagocytosis (first described by Metchnikoff in 1884), and the epoch-making discovery of the opsonins of the blood by Wright, do not here concern us (see II. below).

Morphology.—Sizes, Forms, Structure, &c.—The Schizomycetes consist of single cells, or of filamentous or other groups of cells, according as the divisions are completed at once or not. While some unicellular forms are less than 1 μ (-001 mm.) in diameter, others have cells measuring 4 μ or 5 μ even 7 μ or 8 μ in thickness, while the length may vary from that of the diameter to many times that measurement. In the filamentous forms the individual cells are often difficult to observe until reagents are applied (e.g. fig. 14), and the length of the rows of cylindrical cells may be many hundred times greater than the breadth. Similarly, the diameters of flat or spheroidal colonies may vary from a few times to many hundred times that of the individual cells, the divisions of which have produced the colony. The shape of the individual cell (fig. 1) varies from that of a minute sphere to that of a straight, curved, or twisted filament or cylinder, which is not necessarily of the same diameter throughout, and may have flattened, rounded, or even pointed ends. The rule is that the cells divide in one direction only—i.e., transverse to the long axis—and therefore produce aggregates of long cylindrical shape; but in rarer cases iso-diametric cells divide in two or three directions, producing flat, or spheroidal, or irregular colonies, the size of which is practically unlimited. The bacterial

1 Cladothrix dichotoma, for example, which is ordinarily a branched, filamentous, sheathed form, at certain seasons breaks up into a number of separate cells which develop a tuft of cilia and escape from the sheath. Such a behavior is very similar to the production of zoospores which is so common in many filamentous algae.
BACTERIOLOGY

Cell is always clothed by a definite cell-membrane, as was shown by the plasmolysing experiments of Fischer and others. Unlike the cell-wall of the higher plants, it gives usually no reactions of cellulose, nor is chitin present as in the fungi, but it consists of a protein substance and is apparently a modification of the general protoplasm. In some cases, however, as in B. tuberculosus, analysis of the cell shows a large amount of cellulose. The cell-walls in some forms swell up into a gelatinous mass so that the cell appears to be surrounded in the unstained condition by a clear, transparent space. When the swollen wall is dense and regular in appearance the term "capsule" is applied to the sheath as in Leuconostoc. Secreted pigments (red, yellow, green and blue) are sometimes deposited in the wall, and some of the iron-bacteria have deposits of oxide of iron in the membranes.

The substance of the bacterial cell when suitably prepared and stained shows in the larger forms a mass of homogeneous protoplasm containing irregular spaces, the vacuoles, which enclose a watery fluid. Scattered in the protoplasm are usually one or more deeply-staining granules. The protoplasm itself may be tinged with colouring matter, bright red, yellow, &c., and may occasionally contain substances other than the deeply-staining granules. The occurrence of a starch-like substance which stains deep blue with iodine has been clearly shown in some forms even where the bacterium is growing on a medium containing no starch, as shown by Ward and others. In other forms a substance (probably glycogen or amylo-dextrin) which turns brown with iodine has been observed. Oil and fat drops have also been shown to occur, and in the sulphur-bacteria numerous fine granules of sulphur.

The question of the existence of a nucleus in the bacteria is one that has led to much discussion and is a problem of some difficulty. In the majority of forms it has not hitherto been possible to demonstrate a nucleus of the type which is so characteristic of the higher plants. Attention has accordingly been directed to the deeply-staining granules mentioned above, and the term chromatin-granules have been applied to them, and they have been considered to represent a rudimentary nucleus. That these granules consist of a material similar to the chromatin of the nucleus of higher forms is very doubtful, and the comparison with the nucleus of higher organized cells rests on a very slender basis. The most recent works (Vejdovsky, MecIcl), however, appear to show that nuclei of a structure and mode of division almost typical are to be found in some of the largest bacteria. It is possible that a similar structure has been overlooked or is invisible in other forms owing to their small size, and that there may be another type of nucleus — the diffuse nucleus — such as Schaudinn believed to be the case in B. butschii. Many bacteria when suspended in a fluid exhibit a power of independent movement which is, of course, quite distinct from the Brownian movement—a non-vital phenomenon common to all finely-divided particles suspended in a fluid. Independent movement is effected by special motile organs, the cilia or flagella. These structures are invisible, with ordinary illumination in living cells or unstained preparations, and can only be made clearly visible by special methods of preparation and staining first used by Löffler. By these methods the cilia are seen to be fine protoplasmic outgrowths of the cell (fig. 1) of the same nature as those of the zoospores and anthraxoids of algae, mosses, &c. These cilia appear to be attached to the cell-wall, being unaffected by plasmolysis, but Fischer states that they really are derived from the central protoplasm and pass through minute pores in the wall. The cilia may be present during a short period only in the life of a Schizomycete, and their number may vary according to the medium on which the organism is growing. Nevertheless, there is more or less constancy in the type of distribution, &c., of the cilia for each species when growing at its best. The chief results may be summed up as follows: some species, e.g. B. anthracis, have no cilia; others have only one flagellum at one pole (Monotrichous), e.g. Bacillus pyocyaneus (fig. 1, c, D); or one at each pole; others again have a tuft of several cilia.

Fig. 2.—The various phases of germination of spores of Bacillus romanos (Fraenkel), as actually observed in hanging drops under very high powers.

A. The spore sown at 11 A.M., as shown at a, had swollen (b) perceptibly by noon, and had germinated by 3.30 P.M., as shown at c: in d at 6 P.M., and e at 8.30 P.M.; the resulting filament is segmenting into bacilli as it elongates, and at midnight (f) consisted of twelve such segments.

B, C. Similar series of phases in the order of the small letters in each case, and with the times of observation attached. A and g occurs the breaking up of the filament into rodlets.

D. Germinating spores in various stages, more highly magnified, and showing the different ways of escape of the filament from the spore-membrane. (H. M. W.)

The substance of the bacterial cell when suitably prepared and stained shows in the larger forms a mass of homogeneous protoplasm containing irregular spaces, the vacuoles, which enclose a watery fluid. Scattered in the protoplasm are usually one or more deeply-staining granules. The protoplasm itself may be tinged with colouring matter, bright red, yellow, &c., and may occasionally contain substances other than the deeply-staining granules. The occurrence of a starch-like substance which stains deep blue with iodine has been clearly shown in some forms even where the bacterium is growing on a medium containing no starch, as shown by Ward and others. Nevertheless, there is more or less constancy in the type of distribution, &c., of the cilia for each species when growing at its best. The chief results may be summed up as follows: some species, e.g. B. anthracis, have no cilia; others have only one flagellum at one pole (Monotrichous), e.g. Bacillus pyocyaneus (fig. 1, c, D); or one at each pole; others again have a tuft of several cilia.

Fig. 3.—Types of Zoogloea. (After Zopf.)

A. Mixed zoogloea found as a pellicle on the surface of vegetable infusions, &c.; it consists of various forms, and contains cocci (a) and rodlets, in series (b and c), &c.

B. Egg-shaped mass of zoogloea of Beggiaa rosa-pericinusa (Bacterium rubescens of Lankester); the gelatinous swollen walls of the large crowded cocci are fused into one central gelatinous envelope.

C. Reticulate zoogloea of the same.

D. E, H. Colonies of Myconostoc engraved in diffusent matrix.

F. Branched filiform zoogloea of Cladathrix (slightly magnified).

G. Zoogloea of Bacterium merismopediaeides, Zoog, containing cocci arranged in tablets. Cilia.
aggregates in the form of plates, or solid or hollow and irregular branched colonies. This may be due to the successive divisions occurring in two or three planes instead of only across the long axis (Sarcina), or to displacements of the cells after division.

**Growth and Division.**—Whatever the shape and size of the individual cell, cell-filament or cell-colony, the immediate visible results of active nutrition are elongation of the cell and its division into two equal halves, across the long axis, by the formation of a septum, which either splits at once or remains intact for a shorter or longer time. This process is then repeated and so on. In the first case the separated cells assume the character of the parent-cell whose division gave rise to them; in the second case they form filaments, or, if the further elongation and divisions of the cells proceed in different directions, plates or spheroidal or other shaped colonies. It not unfrequently happens, however, that groups of cells break away from their former connexion as longer or shorter straight or curved filaments, or as solid masses. In some filamentous forms this "fragmentation" into multicellular pieces of equal length or nearly so is a normal phenomenon, each partial filament repeating growth, division and fragmentation as before (cf. figs. 2 and 6). By rapid division hundreds of thousands of cells may be produced in a few hours, and, according to the species and the conditions (the medium, temperature, &c.), enormous collections of isolated cells may cloud the fluid in which they are cultivated, or form deposits below or films on its surface; valuable characters are sometimes obtained from these appearances. When these dense "swarms of vegetative cells become fixed in a matrix of their own swollen contiguous cell-walls, they pass over into a sort of resting state as a so-called zoogloea (fig. 3).

One of the most remarkable phenomena in the life-history of the Schizomyzocetes is the forma-zoologoea stage, which gives rise to the "palmella" condition of the lower Algae. This occurs as a membrane on the surface of the medium, or as irregular clumps or branched masses (sometimes several inches across) submerged in it, and consists of more or less gelatinous matrix enclosing innumerable "coci," "bacteria," or other elements of the Schizomyzocete concerned. Formerly regarded as a distinct genus—the natural fate of all the various

Brefeld has observed that a bacterium may divide once every half-hour, and the progeny repeat the process in the same time. One bacterium might thus produce in twenty-four hours a number of segments amounting to many millions of millions.
forms—the zoogloea is now known to be a sort of resting condition of the Schizomyces, the various elements being glued together, as it were, by their enormously swollen and diffusible cell-walls becoming contiguous. The zoogloea is formed by active division of single or of several mother-cells, and the progeny appear to go on secreting the cell-wall substance, which then absorbs many times its volume of water, and remains as a consistent matrix, in which the cells come to rest. The matrix—i.e. the swollen cell-walls—in some cases consists mainly of cellulose, in others chiefly of a proteinoid matrix; in some cases is horny and resistant, in others more like a thick solution of gum. It is intelligible from the mode of formation that foreign bodies may become entangled in the gelatinous matrix, and compound zoogloeae may arise by the apposition of several distinct forms, a common event in macerating troughs (fig. 3, A). Characteristic forms may be assumed by the young zoogloea of different species,—spherical, ovoid, reticular, filamentous, fruiticose, lamellar, &c.,—but these vary considerably as the mass increases or comes in contact with others. Older zoogloea may precipitate oxide of iron in the matrix, if that metal exists in small quantities in the medium. Under favourable conditions the elements in the zoogloea again become active and move out of the matrix, distribute themselves in the surrounding medium, to grow and multiply as before. If the zoogloea is formed on a solid substratum it may become firm and horny; immersion in water softens it as described above.

The growth of an ordinary bacterium consists in uniform elongation of the rodlet until its length is doubled, followed by division by a median septum, then by the simultaneous doubling in length of each daughter cell, again followed by the median division, and so on (figs. 13, 14). If the cells remain connected the resulting filament repeats these processes of elongation and subsequent division uniformly so long as the conditions are maintained, and very accurate measurements have been obtained on such a form, e.g. B. ramosus. If a rodlet in a hanging drop of nutrient gelatine is fixed under the microscope and kept at constant temperature, a curve of growth can be obtained recording the behaviour during many hours or days. The measured lengths are marked off on ordinates erected on an abscissa, along which the times are noted. The curve obtained on joining the former points then brings out a number of facts, foremost among which are (1) that as long as the conditions remain constant the doubling periods—i.e. the times taken by any portion of the filament to double its length—are constant, because each cell is equally active along the whole length; (2) there are optimum, minimum and maximum temperatures, other conditions remaining constant, at which growth begins, runs at its best and is soon exhausted, respectively; (3) that the most rapid cell-division and maximum growth do not necessarily accord with the best conditions for the life of the organism; and (4) that any sudden alteration of temperature brings about a check, though a slow rise may accelerate growth (fig. 8). It was also shown that exposure to light, dilution or exhaustion of the food-media, the presence of traces of poisons or metabolic products check growth or even bring it to a standstill; and the death or injury of any single cell in the filamentous series shows its effect on the curve by lengthening the doubling period, because its potential progeny have been put out of play. Hardy has shown that such a destruction of part of the filament may be effected by the attacks of another organism.

**FIG. 7.**—Bacillus anthracis. (After Koch.)
A. Bacilli mingled with blood-corpuscles from the blood of a guinea-pig; some of the bacilli dividing.
B. The rodlets after three hours' culture in a drop of aqueous humour. They grow out into long leptothrix-like filaments, which become septate later, and spores are developed in the segments.

**FIG. 8.**—Curve of growth of a filament of Bacillus ramosus (Fraenkel, constructed from data such as in fig. 4. The abscissae represent intervals of time, the ordinates the measured lengths of the growing filament. Thus, at 2.55 P.M. the length of the filament was 6 μ; at 5.45, 20 μ; at 8 P.M., 70 μ and so on. Such curves show differences of steepness according to the temperature (see temp. curve), and to alterations of light (lamp) and darkness. (H. M. W.)

A very characteristic method of reproduction is that of spore-formation, and these minute reproductive bodies, which represent a resting stage of the organism, are now known in many forms. Formerly two kinds of spores were described, arthrospores and endospores. An arthrospore, however, is not a true spore but merely an ordinary vegetative cell which separates and passes into a condition of rest, and such may occur in forms which form endospores, e.g. B. subtilis, as well as in species not known to form endospores. The true spore or endospore begins with the appearance of a minute granule in the protoplasm of a vegetative cell; this granule enlarges and in a few hours has taken to itself all the protoplasm, secreted a thin but very resistant envelope, and is a ripe ovoid spore, smaller than the mother-cell and lying loosely in it (cf. figs. 6, 9, 10, and 11). In the case of the simplest and most minute Schizomyces...
(Micrococcus, &c.) no definite spores have been discovered; any one of the vegetative micrococci may commence a new series of cell by growth and division. We may call these forms "asporous," at any rate provisionally.

The spore may be formed in short or long segments, the cell-wall of which may undergo change of form to accommodate itself to the contents. As a rule only one spore is formed in a cell, and the process usually takes place in a bacillar segment. In some cases the spore-forming protoplasm gives a blue reaction with iodine solutions. The spores may be developed in cells which are actively swelling, the movements not being interfered with by the process (fig. 4, D). The so-called "Köpfchenbacterien" of older writers are simply bacterioid segments with a spore at one end, the mother cell-wall having adapted itself to the outline of the spore (fig. 4, F). The ripe spores of Schizomyces are spherical, oval or long-ovoid in shape and extremely minute (e.g. those of Bacillus subtilis measure 0.0012 mm. long by 0.0006 mm. broad according to Zopf), highly refractive and colourless (or very dark, probably owing to the high index of refraction and minute size). The membrane may be relatively thick, and even exhibit shells or strata.

The germination of the spores has now been observed in several forms with care. The spores are capable of germination at once, or they may be kept for months and even years, and are very resistant against desiccation, heat and cold, &c. In a suitable medium and at a proper temperature the germination is completed in a few hours. The spore swells and elongates and the contents grow forth to a cell-like that which produced it, in some cases clearly breaking through the membrane, the remains of which may be seen attached to the young germinal rodlet (figs. 5, 9 and 11); in other cases the surrounding membrane of the spore swells and dissolves. The germinal cell then grows forth into the forms typical for the particular Schizomyces concerned.

The conditions for spore-formation differ. Anaerobic species usually require little oxygen, but aerobic species a free supply. Each species has an optimum temperature and many are known to require very special food-media. The systematic interference with these conditions has enabled bacteriologists to induce the development of so-called asporogenous races, in which the formation of spores is indefinitely postponed, changes in vigour, virulence and other properties being also involved, in some cases at any rate. The addition of minute traces of acids, poisons, &c., leads to this change in some forms; high temperature has also been used successfully.

The difficult subject of the classification 1 of bacteria dates from the year 1872, when Cohn published his system, which was extended in 1875; this scheme has in fact dominated the study of bacteria ever since. Zopf in 1885 proposed a scheme based on the acceptance of extreme views of pleomorphism; his system, however, was extraordinarily impracticable and was recognized by him as provisional only.

Systems have also been brought forward based on the formation of arthropores and endospores, but as explained above this is eminently unsatisfactory, as arthropores are not true spores and both kinds of reproductive bodies are found in one and the same form. Numerous attempts have been made to construct schemes of classification based on the power of growing colonies

---

1 The difficulties presented by such minute and simple organisms as the Schizomyces are due partly to the few "characters" which they possess and partly to the dangers of error in manipulating them; it is anything but an easy matter either to trace the whole development of a single form or to recognize with certainty any one stage in the development unless the others are known. This being the case, and having regard to the minuteness and ubiquity of these organisms, we should be very careful in accepting evidence as to the continuity or otherwise of any two forms which falls short of direct and uninterrupted observation. The outcome of all these considerations is that, while recognizing that the genera "and " species" as defined by Cohn must be recast, we are not warranted in uniting any forms the continuity of which has not been directly

to liquefy gelatine, to secrete coloured pigments, to ferment certain media with evolution of carbon dioxide or other gases, or to induce pathological conditions in animals. None of these systems, which are chiefly due to the medical bacteriologists, has maintained its position, owing to the difficulty of applying the characters and to the fact that such properties are physiological and liable to great fluctuations in culture, because a given organism may vary greatly in such respects according to its degree of vitality at the time, its age, the mode of nutrition observed; or, at any rate, the strictest rules should be followed in accepting the evidence adduced to render the union of any forms probable.
and the influence of external factors on its growth. Even when used in conjunction with purely morphological characters, these physiological properties are too variable to aid us in the differential examination of species and genera, and are apt to break down at critical periods. Among the more characteristic of these schemes adopted at various times may be mentioned those of Miquel (1867), Eisenhut (1891), and Lehmann and Neumann (1897). Although much progress has been made in determining the value and constancy of morphological characters, we are still in need of a sufficiently comprehensive and easily applied scheme of classification, partly owing to the existence in the literature of imperfectly described forms the life-history of which is not yet known, or the microscopic characters of which have not been examined with sufficient accuracy and thoroughness. The principal attempts at morphological classifications recently brought forward are those of de Toni and Trevisan (1886), Fischer (1897) and Migula (1897). Of these systems, which alone are available in any practical scheme of classification, the two most important and most modern are those of Fischer and Migula. The extended investigations of the former on the number and distribution of cilia (see fig. 1) led him to propose a scheme of classification based on these and other morphological characters, and differing essentially from any preceding one. This scheme may be tabulated as follows—

I. ORDER—**Haplobacteria**. Vegetative body unicellular; spheroidal, cylindrical or spirally twisted; isolated or connected in filamentous or other growth series.

1. Family—**Coccaeeae**. Vegetative cells spheroidal.
   (a) Sub-family—**Allo coccaeeae**. Division in all or any planes, colonies indefinite in shape and size, of cells in short chains, irregular clumps, pairs or isolated: **Micrococci** (Cohn), cells non-motile; **Planococci** (Migula), cells motile.
   (b) Sub-family—**Homococcaeeae**. Division planes regular and definite: **Sarcinae** (Goods.), cells non-motile; growth and division in three successive planes at right angles, resulting in packet-like groups: **Planosarcina** (Migula), as before, but motile; **Pediosacccus** (Lindner), division planes at right angles in two successive planes, and cells in tablets of four or more; **Streptococci** (Bill.), divisions in one plane only, resulting in chains of cells.

2. Family—**Bacillaceae**. Vegetative cells cylindrical (rods), ellipsoidal or ovoid, and straight. Division planes always perpendicular to the long axis.
   (a) Sub-family—**Bacillaceae**. Sporogenous rods cylindrical, not altered in shape: **Bacillis** (Cohn), non-motile; **Bacillus** (Fischer), motile, with one polar flagellum (monotrichous); **Bacilliform** (Fischer), motile, with a terminal tuft of cilia (lophotrichous); **Bacillium** (Fischer), motile, with cilia all over the surface (peritrichous).
   (b) Sub-family—**Clostridiaceae**. Sporogenous rods, spindle-shaped: **Clostridium** (Prazm.), motile (peritrichous).
   (c) Sub-family—**Flectiaceae**. Sporogenous rods, drumstick-shaped: **Flectiridium** (Fischer), motile (peritrichous).

3. Family—**Spirillumaceae**. Vegetative cells, cylindric but curved more or less spirally. Divisions perpendicular to the long axis: **Vibrio** (Müller-Löffter), comma-shaped, motile, monontrichous; **Spirellum** (Ehrenb.), more strongly curved in open spirals, motile, lophotrichous; **Spireoacte** (Ehrenb.), spirally coiled in numerous close turns, motile, but apparently owing to flexible movements, as no cilia are found.

II. ORDER—**Trichobacteria**. Vegetative body of branched or unbranched cell-filaments, the segments of which separate as swarm-cells (Gonidia).

1. Family—**Trichobacteriacae**. Characters those of the Order.
   (a) Filaments rigid, non-motile, sheathed: **Crenothrix** (Cohn), filaments unbranched and devoid of sulphur particles; **Thiothrix** (Winogr.), as before, but with sulphur particles; **Cladothrix** (Cohn), filaments branched in a pseudo-dichotomous manner.

(b) Filaments showing slow pendulous and creeping movements, and with no distinct sheath: **Beggioa** (Trevel.), with sulphur particles.

The principal objections to this system are the following—

1. The extraordinary difficulty in obtaining satisfactory preparations showing the cilia, and the discovery that these motile organs are not formed on all substrata, or are only developed during short periods of activity, while pleomorphism is young and vigorous, renders this character almost nugatory. For instance, **B. meglarum** and **B. substilis** pass in a few hours after commencement of growth from a motile stage with peritrichous cilia, into one of filamentous growth, and are thus obtained by casting of the cilia. (2) By far the majority of the described species (over 1000) fall into the three genera—**Micrococci** (about 400), **Bacillus** (about 200) and **Bacillium** (about 150), so that only a quarter or so of the forms are selected out by the other genera. (3) The monotrichous and lophotrichous conditions are by no means constant even in the motile stage: thus **Pseudomonas rosea** (Mig.) may have 1, 2 or 3 cilia at either end, and would be distributed by Fischer's classification between **Bacillium** and **Bacillium**, according to which state was observed. In Migula's scheme the attempt is made to avoid some of these difficulties, but others are introduced by his otherwise clever devices for dealing with these puzzling little organisms.

The question, What is an individual? has given rise to much difficulty and caused much of the many of the speculations regarding pleomorphism have centred without useful result. If a tree fall apart into its constituent cells periodically we should have the same difficulty on a larger and more complex scale. The fact that every cell is of a specific kind or cells may perform all the physiological functions of the species, is however, to regard it as the individual—a view which cannot be consistent in those cases where a simple or branched filamentous series exists between individual fixed form and so forth. It may be doubted whether the discussion is profitable, though it appears necessary in some cases—e.g., among the pleomorphs—to adopt some definition of individual.

**Myxobacteria**.—To the two divisions of bacteria, Haplobacteria and Trichobacteria, must now be added a third division, Myxobacteria. One of the first members of this group, **Chondromyces crocatus**, was described as long ago as 1857 by Berkeley, but its nature was not understood and it was ascribed to the Hyphomycetes. In 1892, however, Thaxter rediscovered it and showed its bacterial nature, founding for it and some allied forms the group **Myxobacteria**. Another form, **Myxococcus**, which he described as an inhabitant of dung, was shown later to be the same as **Polysaccharium vitellinum**, described by Link in 1795, the exact nature of which has now been doubt. Thaxter's observations and conclusions were called in question by some botanists, but his later observations and those of Baur have established firmly the position of the group. The peculiarity of the group lies in the fact that the bacteria form pseudomycelinous—like aggregations and build themselves up into sporogenous structures of definite form superficially similar to the cysts of the Mycetozoa (fig. 12). Most of the forms in question are found on the dung of herbivorous animals, but the bacteria occur not only in the alimentary canal of the animal but also free in the air. The Myxobacteria are most easily obtained by keeping at a temperature of 30°-35° C. in the dark dung which has lain exposed to the air for at least eight days. The high temperature is favourable to the growth of the bacteria but
BACTERIOLOGY

inimical to that of the fungi which are so common on this sub-stratum.
The discoveries that some species of nitrifying bacteria and perhaps pigmented forms are capable of carbon-assimilation, that others can fix free nitrogen and that a number of decompositions hitherto unsuspected are accomplished by Schizomycetes, have put the questions of nutrition and fermentation in quite new lights. Apart from numerous fermentation processes such as rotting, the soaking of skins for tanning, the preparation of indigo and of tobacco, hay, ensilage, &c, in all of which bacterial fermentations are concerned, attention may be especially directed to the following evidence of the supreme importance of Schizomycetes in agriculture and daily life. Indeed, nothing marks the attitude of modern bacteriology more clearly than the increasing attention which is being paid to useful fermentations. The vast majority of these organisms are not pathogenic, most are harmless and many are indispensable aids in natural operations important to man.

Fischer has proposed that the old division into saprophytes and parasites should be replaced by one which takes into account other peculiarities in the mode of nutrition of bacteria. The nitrifying, nitrogen-fixing, sulphur- and iron-bacteria he regards as monotrophic, i.e., as able to carry on a particular series of fermentations or decompositions only, and since they require no organic food materials, or at least are able to work up nitrogen or carbon from inorganic sources, he regards them as primitive forms in this respect and terms them Prototrophic. They may be looked upon as the nearest existing representatives of the primary forms of life which first obtained the power of working up non-living into living materials, and as playing a correspondingly important rôle in the evolution of life on our globe. The vast majority of bacteria, on the other hand, which are ordinarily termed saprophytes, are saprogenic, i.e., bring organic material to the putrefactive state—or saprophilous, i.e., live best in such putrefying materials—or become symbogenic, i.e., their metabolic products may induce blood-poisoning or other toxic effects (facultative parasites) though they are not true parasites. These forms are termed by Fischer Metatrophic, because they require various kinds of organic materials obtained from the dead remains of other organisms or from the surfaces of their bodies, and can utilize and decompose them in various ways (Polytrophic) or, if monotrophic, are at least unable to work them up. The true parasites—obligate parasites of de Bary—are placed by Fischer in a third biological group, Paratrophic bacteria, to mark the importance of their mode of life in the interior of living organisms where they live and multiply in the blood, juices or tissues.

When we reflect that some hundreds of thousands of tons of urea are daily deposited, which ordinary plants are unable to assimilate until considerable changes have been undergone, the question is of importance, What happens in the meantime? In effect the urea first becomes carbonate of ammonia by a simple hydrolysis brought about by bacteria, more and more definitely known since Pasteur, van Tieghem and Cohn first described them. Lea and Miquel further proved that the hydrolysis is due to an enzyme—urease—separable with difficulty from the bacteria concerned. Many forms in rivers, soil, manure heaps, &c, are capable of bringing about this change to ammonium carbonate, and much of the loss of volatile ammonia on farms is preventible if the facts are apprehended. The excreta of urea alone thus afford to the soil enormous stores of nitrogen combined in a form which can be rendered available by bacteria, and there are in addition the supplies brought down in rain from the atmosphere, and those due to other living débris. The researches of later years have demonstrated that a still more inexhaustible supply of nitrogen is made available by the nitrogen-fixing bacteria of the soil. There are in all cultivated soils forms of bacteria which are capable of forcing the inert free nitrogen to combine with other elements into compounds assimilable by plants. This was long asserted as probable before Winogradsky showed that the conclusions of M. P. E. Berthelot, A. Laurent and others were right, and that Clostridium pasteurianum, for instance, protected from access of free oxygen by an envelope of aerobic bacteria or fungi, and provided with the carbohydrates and minerals necessary for its growth, fixes nitrogen in proportion to the amount of sugar consumed. This interesting case of symbiosis is equalled by yet another case. The work of numerous observers has shown that the free nitrogen of the atmosphere is brought into combination in the soil in the nodules filled with bacteria on the roots of Leguminosae, and since these nodules are the morphological expression of a symbiosis between the higher plant and the bacteria, there is evidently here a case similar to the last.

As regards the ammonium carbonate accumulating in the soil from the conversion of urea and other sources, we know from Winogradsky’s researches that it undergoes oxidation in two stages owing to the activity of the so-called "nitrifying" bacteria (an unfortunate term inasmuch as "nitrification" refers merely to a particular phase of the cycle of changes undergone by nitrogen). It had long been known that under certain conditions large quantities of nitrate (saltpetre) are formed on exposed heaps of manure, &c, and it was supposed that direct oxidation of the ammonia, facilitated by the presence of porous bodies, brought this to pass. But research showed that this process of nitrification is dependent on temperature, aération and moisture, as is life, and that while nitre-beds can infect one another, the process is stopped by sterilization. R. Warington, J. T. Schlossing, C. A. Mints and others had proved that nitrification was promoted by some organism, when Winogradsky hit on the happy idea of isolating the organism by using gelatinous silica, and so avoiding the difficulties which Warington had shown to exist with the organism in presence of organic nitrogen, owing to its refusal to nitrify on gelatine or other nitrogenous media. Winogradsky’s investigations resulted in the discovery that two kinds of bacteria are concerned in nitrification; one of these, which he terms the Nitrous-bacteria, is only capable of bringing about the oxidation of the ammonia to nitrous acid, and the astonishing result was obtained that
this can be done, in the dark, by bacteria to which only pure mineral salts—e.g. carbonates, sulphates and chlorides of ammonium, sodium and magnesium—were added. In other words these bacteria can build up organic matter from purely mineral sources by assimilating carbon from carbon dioxide in the dark and by obtaining their nitrogen from ammonia. The energy liberated during the oxidation of the nitrogen is regarded as splitting the carbon dioxide molecule,—in green plants it is the energy of the solar rays which does this. Since the supply of free oxygen is dependent on the activity of green plants the process is indirectly dependent on energy derived from the sun, but it is none the less an astounding one outside and the limits of our previous generalizations. It has been suggested that urea is formed by polymerization of ammonium carbonate, and formic aldehyde is synthesized from CO₂ and OH⁻. The Nitro-bacteria are smaller, finer and quite different from the nitroso-bacteria, and are incapable of attacking and utilizing ammonium carbonate. When the latter have oxidized ammonia to nitrite, however, the former step in and oxidize it still further to nitric acid. It is probable that important consequences of these actions result from the presence of nitrifying bacteria in rotten stone, the globe generally. The ammonia may be oxidized to nitrates and nitrites, and then pass into the higher plants and be worked up into proteoids, and so be handed on to animals, eventually to be broken down by bacterial action again to ammonia; or the nitrates may be degraded to nitrites and even to free nitrogen or ammonia, which escapes.

That the Leguminosae (a group of plants including peas, beans, vetches, lupins, &c.) play a special part in agriculture was known even to the ancients and was mentioned by Pliny (Historia Naturalis, viii.). These plants will not only grow on poor sandy soil without any addition of nitrogenous manure, but they actually enrich the soil on which they are grown. Hence leguminous plants are essential in all rotation of crops. By analysis it was shown by Schulz-Lupitz in 1881 that the way in which these plants enrich the soil is by increasing the nitrogen-content. Soil which had been cultivated for many years as pasture was sown with lupins for fifteen years in succession; an analysis then showed that the soil contained more than three times as much nitrogen as at the beginning of the experiment. The only possible source for this increase was the atmospheric nitrogen. It had been, however, an axiom with botanists that the green plants were unable to use the nitrogen of the air. The apparent contradiction was explained by the experiments of H. Hellriegel and Wilfarth in 1888. They showed that, when grown on sterilized sand with the addition of mineral salts, the Leguminosae were no more able to use the atmospheric nitrogen than other plants such as oats and barley. Both kinds of plants required the addition of nitrates to the soil. But if a little water in which arable soil had been shaken up was added to the sand, then the leguminous plants flourished in the absence of nitrates and showed an increase in nitrogenous material. They had clearly made use of the nitrogen of the air. When these plants were examined they had small swellings or nodules on their roots, while those grown in sterile sand without soil-extract had no nodules. Now these peculiar nodules are a normal characteristic of the roots of leguminous plants grown in ordinary soil. The experiments above mentioned made clear for the first time the nature and activity of these nodules. They are clearly the result of infection (if the soil extract was boiled before addition to the sand no nodules were produced), and their presence enabled the plant to absorb the free nitrogen of the air.

The work of recent investigators has made clear the whole process. In an ordinary arable soil there exist motile rod-like bacteria, Bacterium radicicola. These enter the root-hairs of leguminous plants, and passing down the hair in the form of a long, slimy (zoogloea) thread, penetrate the tissues of the root. As a result the tissues become hypertrophied, producing the well-known nodule. In the cells of the nodule the bacteria multiply and develop, drawing material from their host. Many of the bacteria exhibit curious involution forces (“bacteroids”), which are finally broken down and their products absorbed by the plant. The nitrogen of the air is absorbed by the nodules, being built up into the bacterial cell and later handed on to the host-plant. It appears from the observations of Mazé that the bacterium can even absorb free nitrogen when grown in cultures

---

**BACTERIOLOGY**

**Fig. 14**—Stages in the formation of a colony of a variety of Bacillus (Proteus) vulgaris (Hauser), observed in a hanging drop. At 11 A.M. a rodlet appeared (A); at 4 P.M. it had grown and divided and broken up into eight rodlets (B); C shows further development at 8 P.M., D at 9.30 P.M.—all under a high power. At E, F, and G further stages are drawn, as seen under much lower power. (H. M. W.)

---

**Fig. 15**—Invasion of leguminous roots by bacteria. a, cell from the epidermis of root of Pea with infection thread (zoogloea) pushing its way through the cell-wall. (After Przemowski.) b, free end of a root-hair of Pea; at the right are particles of earth and on the left a mass of bacteria. Inside the hair the bacteria are pushing their way up in a thin stream. (From Fischer’s Vorlesungen über Bakterien.)

---
outside the plant. We have here a very interesting case of symbiosis as mentioned above. The green plant, however, always keeps the upper hand, restricting the development of the bacteria to the nodules and later absorbing them for its own use. It should be mentioned that different genera require different races of the bacterium for the production of nodules.

The important part that these bacteria play in agriculture led to the introduction in Germany of a commercial product (the so-called "nitragin") consisting of a pure culture of the bacteria, which is to be sprayed over the soil or applied to the seeds before sowing. This material was found at first to have a very uncertain effect, but later experiments in America, and the use of a modified preparation in England, under the direction of Professor Bottomley, have had successful results; it is possible that in the future a preparation of this sort will be widely used.

The apparent specialization of these bacteria to the leguminous plants has always been a very striking fact, for similar bacterial nodules are known only in two or three cases outside this particular group. However, Professor Bottomley announced at the meeting of the British Association for the Advancement of Science in 1907 that he had succeeded in breaking down this specialization and by a suitable treatment had caused bacteria from leguminous nodules to infect other plants such as cereals, tomato, rose, with a marked effect on their growth. If these results are confirmed and the treatment can be worked commercially, the importance to agriculture of the discovery cannot be overestimated; each plant will provide, like the bean and vetch, its own nitrogenous manure, and larger crops will be produced at a decreased cost.

Another important advance is in our knowledge of the part played by bacteria in the circulation of carbon in nature. The enormous masses of cellulose deposited annually on the earth's surface are, as we know, principally the result of chlorophyll action on the carbon dioxide of the atmosphere decomposed by energy derived from the sun; and although we know little as yet concerning the magnitude of other processes of carbon-assimilation — e.g., by nitrifying bacteria — it is comparatively small. Such cellulose is gradually reconverted into water and carbon dioxide, but for some time nothing positive was known as to the agents which thus break up the paper, rags, straw, leaves and wood, &c., accumulating in cesspools, forests, marshes and elsewhere in such abundance. The work of van Tieghem, van Senus, Fribes, Omeliansky and others has now shown that while certain anaerobic bacteria decompose the substance of the middle lamella—chiefly pectin compounds—and thus bring about the isolation of the cellulose fibres when, for instance, flax is steeped or "retted," they are unable to attack the cellulose itself. There exist in the mud of marshes, rivers and cloaca, &c., however, other anaerobic bacteria which decompose cellulose, probably hydrolysing it first and then splitting the products into carbon dioxide and marsh gas. When calcium sulphate is present, the nascent methane induces the formation of calcium carbonate, sulphuric acid, hydrogen and water. We have thus an explanation of the occurrence of marsh gas and sulphuretted hydrogen in bogs, and it is highly probable that the existence of these gases in the intestines of herbivorous animals is due to similar putrefactive changes in the undigested cellulose remains.

Cohn long ago showed that certain glistening particles observed in the cells of Beggiatoa consist of sulphur, and Winogradsky and Beyericin have shown that a whole series of sulphur bacteria of the genera Thiobacillus, Chromatium, Spirillum, Monas, &c., exist, and play important parts in the circulation of this element in nature, e.g. in marshes, estuaries, sulphur springs, &c. When cellulose bacteria set free marsh gas, the nascent gas reduces sulphates — e.g. gypsum — with liberation of SH₂ and it is found that the sulphur bacteria thrive under such conditions by oxidizing the SH₂ and storing the sulphur in their own protoplasm. If the SH₂ runs short they oxidize the sulphur again to sulphuric acid, which combines with any calcium carbonate present and forms sulphate again. Similarly nascent methane may reduce iron salts, and the black mud in which these bacteria often occur owes its colour to the FeS formed. Beyericin and Jegunow have shown that some partially anaerobic sulphur bacteria can only exist in strata at a certain depth below the level of quiet waters where SH₂ is being set free below by the bacterial decompositions of vegetable mud and rises to meet the atmospheric oxygen coming down from above, and that this zone of physiological activity rises and falls with the variations of partial pressure of the gases due to the rate of evolution of the SH₂. In the deeper parts of this zone the bacteria absorb the SH₂ and, as they rise, oxidize it and store up the sulphur; then ascending into planes more highly oxygenated, oxidize the sulphur to SO₂. These bacteria therefore employ SH₂ as their respiratory substance, much as higher plants employ carbohydrates — instead of liberating energy as heat by the respiratory combustion of sugars, they do it by oxidizing hydrogen sulphide. Beyericin has shown that Spirillum desulphuricans, a definite anaerobic form, attacks and reduces sulphates, thus undoing the work of the sulphur bacteria as certain de-nitrifying bacteria reverse the operations of nitro-bacteria. Here again, therefore, we have sulphur, taken

**Fig. 17.** — A plate-culture of a bacillus which had been exposed for a period of four hours behind a zinc plate-plate, in which the letters C and B were cut. The light had to traverse a screen of water before passing through the C, and one of aspatin (which filters out the blue and violet rays) before passing the B. The plate was then incubated, and, as the figure shows, the bacteria on the C-shaped area were all killed, whereas they developed elsewhere on the plate (traces of the B are just visible to the right) and covered it with an opaque growth. (H. M. W.)
into the higher plants as sulphates, built up into proteins, decomposed by putrefactive bacteria and yielding \( \text{H}_2 \text{S} \) which the sulphur bacteria oxidize; the resulting sulphur is then again oxidized to \( \text{SO}_3 \) and again combined with calcium to gypsum, the cycle being thus complete.

Chalybeate waters, pools in marshes near ironstone, 
&c., abound in bacteria, some of which belong to the remarkable genera *Crenothrix*, *Cladothrix*, and *Lepothrix*, and contain ferric oxide, i.e., rust, in their cell-walls. This iron deposit is not merely mechanical but is due to the physiological activity of the organism which, according to Winogradsky, liberates energy by oxidizing ferrous and ferric oxide in its protoplasm—a view not accepted by H. Molisch. The iron must be in certain soluble conditions, however, and the soluble bicharbonate of the protoxide of chalybeate springs seems most favourable; the hydrocarbonate absorbed by the cells is oxidized, probably thus:

\[
2\text{FeCO}_3 + 3\text{H}_2\text{O} + \text{O} = \text{Fe}_2(\text{OH})_3 + 2\text{CO}_2.
\]

The ferric hydroxide accumulates in the sheath, and gradually passes into the more insoluble ferric oxide. These actions are of extreme importance in nature, as their continuation results in the enormous deposits of bog-iron ore, ochre, and—since Molisch has shown that the iron can be replaced by manganese in some bacteria—of manganese ores.

Considerable advances in our knowledge of the various chromogenic bacteria have been made by the studies of Beyerinck, Lankester, Engelmann, Ewart and others, and have assumed exceptional importance owing to the discovery that *Bacteriopurpurin*—the red colouring matter contained in certain sulphur bacteria—absorbs certain rays of solar energy, and enables the organism to utilize the energy for its own life-purposes. Engelmann showed, for instance, that these red-purple bacteria collect in the ultra-red, and to a less extent in the orange and green, in bands which agree with the absorption spectrum of the extracted colouring matter. Not only so, but the evident parallelism between this absorption of light and that by the chlorophyll of green plants, is completed by the demonstration that oxygen is set free by these bacteria—i.e. by means of radiant energy trapped by their colour-screens the living cells are in both cases enabled to do work, such as the reduction of highly oxidized compounds.

The most recent observations of Molisch seem to show that bacteria possessing bacteriopurpurin exhibit a new type of assimilation—the assimilation of organic material under the influence of light. In the case of these red-purple bacteria the colouring matter is contained in the protoplasm of the cell, but in most chromogenic bacteria it occurs as excrusted pigment and on between the cells, or is formed by their action in the medium. Ewart has confirmed the principal conclusions concerning these purple, and also the so-called chlorophyll bacteria (*B. viride*, *B. chlorinum*, &c.), the results going to show that these are, as many authorities have held, merely minute algae. The pigment itself may be soluble in water, as is the case with the blue-green fluorescent body formed by *B. pyocyanes*, *B. fluorescens* and a whole group of fluorescent bacteria. Neilsen found that the pigment given a band in the yellow and some lines at E and F in the solar spectrum—an absorption spectrum almost identical with that of triphenyl-rosaniline. In the case of the scarlet and crimson red pigments of *B. prodigiosus*, *B. ruber*, &c., the violet of *B. violaceus*, *B. jauniceps*, &c., the red-purple of the sulphur bacteria, and indeed most bacterial pigments, solution in water does not occur, though alcohol extracts the colour readily. Finally, there are a few forms which yield their colour to neither alcohol nor water, e.g., the yellow *Micrococcus cerasus-flavus* and the *B. berolinensis*. Much work is still necessary before we can estimate the importance of these pigments. Their spectra are only imperfectly known in a few cases, and the bearing of the absorption on the life-history is still a mystery. In many cases the colour-production is dependent on certain definite conditions—temperature, presence of oxygen, nature of the food-medium, &c. Ewart's important discovery that some of these lipochrome pigments occur

oxygen, while others do not, may have bearings on the facultative anaerobism of these organisms.

A branch of bacteriology which offers numerous problems of importance is that which deals with the organisms so common in milk, butter and cheese. Milk is a medium not only admirably suited to the growth of bacteria, but, as a matter of fact, always contaminated with these organisms in the ordinary course of supply. F. Lafar has stated that 26% of the cows in Germany suffer from tuberculosis, which also affected 17.7% of the cattle slaughtered in Copenhagen between 1801 and 1803, and that one in every thirteen samples of milk examined in Paris, and one in every nineteen in Washington, contained tubercle bacilli. Hence the desirability of sterilizing milk used for domestic purposes becomes imperative.
BACTERIOLOGY

That bacterial fermentations are accompanied by the evolution of heat is an old experience; but the discovery that the "spontaneous" combustion of sterilized cotton-wool does not occur simply if moist and freely exposed to oxygen, but results when the washings of fresh waste are added, has led to clearer proof that the heating of hay-stacks, hops, tobacco and other vegetable products is due to the vital activity of bacteria and fungi, and is physiologically a consequence of respiratory processes like those in melting. It seems fairly established that when the preliminary heating process of fermentation is drawing to a close, the cotton, hay, &c., having been converted into a highly porous friable and combustible mass, may then ignite in certain circumstances by the occlusion of oxygen, just as ignition is induced by finely divided metals. A remarkable point in this connexion has always been the necessary conclusion that the living bacteria concerned must be exposed to temperatures of at least 70° C. in the hot heaps. Apart from the resolution of doubts as to the powers of spores to withstand such temperatures for long periods, the discoveries of Miquel, Globig and others have shown that there are numerous bacteria which will grow and divide at such temperatures, e.g. **B. thermophilus**, from sewage, which is quite active at 70° C., and **B. Ludwigi** and **B. ilidens**, &c., from hot springs, &c.

The bodies of sea fish, e.g. mackerel and other animals, have long been known to exhibit phosphorescence. This phenomenon is due to the activity of a whole series of marine bacteria of various genera, the examination and cultivation of which have been successfully carried out by Cohn, Beyerinck, Fischer and others. The cause of the phosphorescence is still a mystery. The suggestion that it is due to the oxidation of a body excreted by the bacteria seems answered by the failure to filter off or extract any such body. Beyerinck's view that it occurs at the moment septum are worked up into the protoplasm cannot be regarded as proved, and the subject must be said of the suggestion that the bacteria use the phosphorescence is due to the oxidation of phosphoretted hydrogen. The conditions of phosphorescence are, the presence of free oxygen, and, generally, a relatively low temperature, together with a medium containing sodium chloride, and peptones, but little or no carbohydrates. Considerable differences occur in these latter respects, however, and interesting results were obtained by Beyerinck with mixtures of species possessing different powers of enzyme action as regards carbohydrates. Thus, a form termed **Photobacterium phosphorescens** by Beyerinck will absorb maltose, and will become luminous if that sugar is present, whereas **P. Plicatus** is indifferent to maltose. If then we prepare densely inuninated plates of these two bacteria in gelatine food-medium to which starch is added as the only carbohydrate, the bacteria grow but do not phosphoresce. If we now streak these plates with an organism, e.g. a yeast, which saccharifies starch, it is possible to tell whether maltose or levulose and fructose are formed; if the former, the only plates containing **P. phosphorescens** will become luminous; if the latter, only those containing **P. Plicatus**. The more recent researches of Molisch have shown that the luminosity of ordinary butcher's meat under appropriate conditions is quite a common occurrence. Thus of samples of meat bought in Prague and kept in a cool room for about two days, luminosity was present in 52% of the samples the case of beef, 55% for veal, and 39% for liver. If the meat was treated previously with a 3% salt solution, 86% of the samples of beef and 65% of the samples of horseflesh were found to exhibit this phenomenon. The cause of this luminosity is **Microcoscos phosphorescens**, an immobile round, or almost round organism. This organism is quite distinct from that causing the luminosity of marine fish.

It has long been known that the production of vinegar depends on the oxidation of the alcohol in wine or beer to acetic acid, the chemical process being probably carried out in two stages, viz. the oxidation of the alcohol leading to the formation of aldehyde and water, and the further oxidation of the aldehyde to acetic acid. The process may even go farther, and the acetic acid be oxidized to CO₂ and OH⁻; the art of the vinegar-maker is directed to preventing the accomplishment of the last stage. These oxidations are brought about by the vital activity of several bacteria, of which four—**Bacterium aceti**, **B. pasteurianum**, **B. kützingianum**, and **B. syline**—have been studied thoroughly by Hansen and A. Brown. It is these bacteria which form the zoogloeae of the "mother of vinegar," though this film may contain other organisms as well. The idea that this film of bacteria oxidizes the alcohol beneath by merely condensing atmospheric oxygen in its interstices, after the manner of spongey platinum, has long been given up; but the explanation of the action as an incomplete combustion, depending on the peculiar respiration of these organisms—much as in the case of nitrifying and sulphur bacteria—is not clear, though the discovery that the acetobacteria will not only oxidize alcohol to acetic acid, but further oxidize the latter to CO₂ and H₂O supports the view that the alcohol is absorbed by these organisms and employed as its respiratory substance. The promise of more light on these oxidations is furnished by the recent discovery that not only bacteria and fungi, but even the living cells of higher plants, contain peculiar enzymes which possess the remarkable property of "carrying" oxygen—much as it is carried in the sulphuric acid chamber—and which have therefore been termed oxydases. It is apparently the presence of these oxydases which causes certain wines to change colour and alter in taste when poured from bottle to glass, and so exposed to air. Thus as the decade from 1880 to 1890 was abounded with investigations on the reactions of bacteria to heat, so the following decade was remarkable for discoveries regarding the effects of other forms of radiant energy. The observations of Downes and Blunt in 1877 left it uncertain whether the bactericial effects in broth cultures exposed to solar rays were due to thermal action or not. Further investigations, in

**FIG. 19.**—Ginger-beer plant, showing yeast (Saccharomyces pyriformis) entangled in the meshes of the bacterium (B. vermiciforme). (H. M. W.)
may result, a point of extreme importance in connexion with the
lighting and ventilation of dwellings, the purification of rivers
and streams, and the general diminution of epidemics in nature.

As we have seen, thermophilous bacteria can grow at high
temperatures, and it has long been known that some forms
develop on ice. The somewhat different question of
the resistance of ripe spores or cells to extremes of
heat and cold has received attention. Ravenel,
Macfadyen and Rowland have shown that several bacilli will
bear exposure for seven days to the temperature of liquid air
(\(-10^\circ\) C. to \(-183^\circ\) C.) and again grow when put into normal
conditions. More recent experiments have shown that even ten
hours’ exposure to the temperature of liquid hydrogen \(-252^\circ\) C.
\((21^\circ\) on the absolute scale) failed to kill them. It is
probable that all these cases of resistance of seeds, spores, &c., are to be
connected with the fact that completely dry albumin does not
lose its coagulability on heating to \(110^\circ\) C. for some hours, since it
is well known that completely ripe spores and dry heat are the
conditions of extreme experiments.

No sharp line can be drawn between pathogenic and
non-pathogenic Schizymycetes, and some of the most marked steps
in the progress of our modern knowledge of these
organisms depend on the discovery that their patho-
genicity or virulence can be modified—diminished or
increased—by definite treatment, and, in the natural course of
epidemics, by alterations in the environment. Similarly we are
unable to divide Schizymycetes sharply into parasites and sapro-
phytes, since it is well proved that a number of species—facul-
tative parasites—can become one or the other according to
circumstances. These facts, and the further knowledge that
many bacteria never observed as parasites, or as pathogenic
forms, produce toxins or poisons as the result of their decom-
positions and fermentations of organic substances, have led to
important results in the applications of bacteriology to medicine.

Bacterial diseases in the higher plants have been described,
but the subject requires careful treatment, since several points
suggest doubts as to the organism described being the
cause of the disease referred to their agency. Until
recently it was urged that the acid contents of plants
explained their immunity from bacterial diseases, but it is now
known that many bacteria can flourish in acid media. Another
objection was that even if bacteria obtained access through the
stomat, they could not penetrate the cell-walls bounding the
intercellular spaces, but certain anaerobic forms are known to
ferment cellulose, and others possess the power of penetrating
the cell-walls of living cells, as the bacteria of Leguminosae
first described by Marshall Ward in 1887, and confirmed by Miss
Dawson in 1888. On the other hand a long list of plant-diseases
has been of late years attributed to bacterial action. Some, e.g.,
the Sereh disease of the sugar-cane, the slime fluxes of oaks and
other trees, are not only very doubtful cases, in which other
organisms such as yeasts and fungi play their parts, but it may
be regarded as extremely improbable that the bacteria are the
primary agents at all; they are doubtless saprophytic forms
which have gained access to rotted tissues injured by other
agents. Saprophybic bacteria can readily make their way down
the dead hypha of an invading fungus, or into the punctures
made by insects, and Aphides have been credited with the
bacterial infection of carnations, though more recent researches
by Woods go to show the correctness of his conclusion that
Aphides alone are responsible for the carnation disease. On
the other hand, recent investigation has brought to light cases in
which bacteria are certainly the primary agents in diseases of
plants. The principal features are the stoppage of the vessels
and consequent wilting of the shoots; as a rule the cut
vessels on transverse sections of the shoots appear brown and
choked with a dark yellowish slime in which bacteria may
be detected, e.g., cabbages, cucumbers, potatoes, &c. In the
carnation disease and in certain diseases of tobacco and other
plants the seat of bacterial action appears to be the parenchyma,
and it may be that Aphides or other piercing insects infect
the plants, much as insects convey pollen from plant to plant, or
(though in a different way) as mosquitoes infect man with
malaria. If the recent work on the cabbage disease may be
accepted, the bacteria make their entry at the water pores at
the margins of the leaf, and thence via the glandular cells to the
tracheids. Little is known of the mode of action of bacteria on
these plants, but it may be assumed with great confidence that
they excrete enzymes and poisons (toxins), which diffuse into
the cells and kill them, and that the effects are in principle the
same as those of parasitic fungi. Support is found for this
opinion in Beyerinck’s discovery that the juices of tobacco
plants affected with the disease known as “leaf mosaic,” will
induce this disease after filtration through porcelain.

In addition to such cases as the kephir and ginger-beer plants
(FIGS. 19, 20), where anaerobic bacteria are associated with
yeasts, several interesting examples of symbiosis
among bacteria are now known. Bacillus chauveaui
ferments cane-sugar solutions in such a way that
normal butyric acid, inactive lactic acid, carbon dioxide, and
Symbiosis.

hydrogen result; Micrococcus acidiparalactici, on the other hand,
ferments such solutions to optically active paralactic acid.
Nencki showed, however, that if both these organisms occur
together, the resulting products contain large quantities of normal
butyl alcohol, a substance which cannot be produced alone.
Other observers have brought forward other cases. Thus
neither B. coli nor the B. denitrificans of Burri and Stutzer
cannot reduce nitrates, but if acting together they so completely undo
the structure of sodium nitrate that the nitrogen passes off
in the free state. Van Senus showed that the concurrence of two
bacteria is necessary before his B. amylobacter can ferment
cellulose, and the case of mud bacteria which evolve sulphuretted
hydrogen below which is utilized by sulphur bacteria above has
already been quoted, as also that of Winogradsky’s Clostridium
BACTERIOLOGY

**Pasierbium**, which is anaerobic, and can fix nitrogen only if protected from oxygen by aerobic species. It is very probable that numerous symbiotic fermentations in the soil are due to this co-operation of oxygen-protecting species with anaerobic ones, e.g., *Tetanus*.

Astonishment has been frequently expressed at the powerful activities of bacteria—their rapid growth and dissemination, the extensive and profound decompositions and fermentations induced by them, the resistance of their spores to dissipation, heat, &c.—but it is worth while to ask how far these properties are really remarkable when all the data for comparison with other organisms are considered. In the first place, the extremely small size and isolation of the vegetative cells place the protoplasmic contents in peculiarly favourable circumstances for action, and we may safely conclude that, weight for weight and molecule for molecule, the protoplasm of bacteria is brought into contact with the environment at far more points and over a far larger surface than is that of higher organisms, whether—as in plants—it is distributed in thin layers round the sap-vacuoles, or—as in animals—is bathed in fluids brought by special mechanisms to irrigate it. Not only so, the isolation of the cell facilitates exchange of liquids and gases, the passage in of food materials and out of enzymes and products of metabolism, and thus each unit of protoplasm obtains opportunities of immediate action, the results of which are removed with equal rapidity, not attainable in more complex multicellular organisms.

To put the matter in another way, if we could imagine all the living cells of a large oak or of a horse, having given up the specializations of function, and simply carried on nutrition, growth, and multiplication which mark the generalized activities of the bacterial cell, and at the same time rendered as accessible to the environment by isolation and consequent extension of surface, we should doubtless find them exercising changes in the fermentable fluids necessary to their life similar to those exerted by an equal mass of bacteria, and that in proportion to their approximation in size to the latter. Ciliary movements, which undoubtedly contribute in bringing the surface into contact with larger supplies of oxygen and other fluids in unity of time, are not so rapid or so extensive when compared with other standards than the apparent dimensions of the microscopic field. The microscope magnifies the distance traversed as well as the organism, and although a bacterium which covers 9-10 cm. or more in 15 minutes—say 0.1 mm. or 100 μ per second—appears to be darting across the field with great velocity, because its own small size—say 5 X 1 μ—comes into comparison, it should be borne in mind that if a mouse 2 in. long only, travelled twenty times its own length, i.e., 40 in., in a second, the distance traversed in 15 minutes at that rate, viz., 1,000 yards, would not appear excessive. In a similar way we must be careful in our wonder at the marvellous rapidity of cell-division and growth of bacteria, that we do not exaggerate the significance of the phenomenon. It takes any ordinary rodlet 30-40 minutes to double its length and divide into two equal daughter cells when growth is at its best; nearer the minimum it may require 3-4 hours or even much longer. It is by no means certain that even the higher rate is greater than that exhibited by a tropical bamboo which will grow over a foot a day, or even common grasses, or asparagus, during the active period of cell-division, though the phenomenon is here complicated by the phase of extension due to intercalation of water. The enormous extension of surface also facilitates the absorption of energy from the environment, and, to take one case only, it is impossible to doubt that some source of radiant energy must be at the disposal of those prototrophic forms which decompose carbonates and assimilate carbonic acid in the dark and oxidize nitrogen in dry rocky regions where no organic materials are at their disposal, even could they utilize them. It is usually stated that the carbon dioxide molecule is here split by means of energy derived from the oxidation of nitrogen, but apart from the fact that none of these processes can proceed until the temperature rises to the minimum cardinal point, Engelmann's experiment shows that in the purple bacteria rays are used other than those employed by green plants, and especially ultra-red rays not seen in the spectrum, and we may probably conclude that "dark rays"—i.e., rays not appearing in the visible spectrum—are absorbed and employed by these and other colourless bacteria. The purple bacteria have thus two sources of energy, one by the oxidation of sulphur and another by the absorption of "dark rays." Stoney (Scient. Proc. R. Dub. Soc., 1893, p. 154) has suggested yet another source of energy, in the bombardment of these minute masses by the molecules of the environment, the velocity of which is sufficient to drive them well into the organism, and carry energy in of which they can avail themselves.

**BACTERIOLOGY**

have since been made, but the routine methods in bacteriological procedure still employed are in great part those given by Koch. By 1876 the anthrax bacillus had been obtained in pure culture by Koch, and some other pathogenic bacteria had been observed in the tissues, but it was in the decade 1880-1890 that the most important discoveries were made in this field. Thus the organisms of suppuration, tubercle, glanders, diphtheria, typhoid fever, cholera, tetanus, and others were identified, and their relationship to the individual diseases established. In the last decade of the 19th century the chief discoveries were of the bacillus of influenza (1892), of the bacillus of plague (1894) and of the bacillus of dysentery (1898). Immunity against diseases caused by bacteria has been the subject of systematic research from 1880 onwards. In producing active immunity by the attenuated virus, Duguid and J. S. Burdon-Sanderson and W. S. Greenfield in Great Britain, and Pasteur, Toussaint and Chauveau in France, were pioneers. The work of Metchnikoff, dating from about 1884, has proved of high importance, his theory of phagocytosis (vide infra) having given a great stimulus to research, and having also contributed to important advances. The modes by which bacteria produce their effects also became the subject of study, and attention was given to their toxic products, notably that of L. Brieger, chiefly concerned ptomaines (vide infra), but no great advance was made. A new field of inquiry was, however, opened up when, by filtration a bacterium-free toxic fluid was obtained which produced the important symptoms of the disease—in the case of diphtheria by P. P. E. Roux and A. Yersin (1888), and in the case of tetanus a little later by various observers. Research was thus directed towards ascertaining the nature of the toxic bodies in such a fluid, and Brieger and Fraenkel (1890) found that they were proteids, to which they gave the name "toxalbumins." Though subsequent research has on the whole confirmed these results, it is still a matter of dispute whether these proteids are the true toxins or merely contain the toxic bodies precipitated along with them. In the United Kingdom the work of Sidney Martin, in the separation of toxic substances from the bodies of those who have died from certain diseases, is also worthy of mention. Immunity against toxins also became a subject of investigation, and the result was the discovery of the antitoxic action of the serum of animals immunized against tetanus toxin by F. Behring and Kitazato (1891), and by Durand and du Val (1892). A similar result was also obtained in the case of diphtheria. The attempts with regard to passive immunity were thus established and were put to practical application by the introduction of diphtheria antitoxin as a therapeutic agent in 1894. The technique of serum preparation has become since that time greatly elaborated and improved, the work of P. Ehrlich in this respect being specially noteworthy. The laws of passive immunity were shown to hold also in the case of immunity against living organisms by R. Pfeiffer (1894), and various anti-bacterial sera have been introduced. Of these the anti-streptococcic serum of A. Marmorek (1895) is one of the best known. The principles of protective inoculation have been developed and practically applied on a large scale, notably by W. M. W. Haffkine in the case of cholera (1881) and plague (1894), and more recently by Wright and Semple in the case of typhoid fever. One other discovery of great importance may be mentioned, viz. the agglutinative action of the serum of a patient suffering from a bacterial disease, first described in the case of typhoid fever independently by Widal and by Grünbaum in 1869, though led up to by the work of Pfeiffer, Gruber, and Durand and others. Thus a new aid was also obtained to medical science, viz. serum diagnosis and serum therapy. The last decade of the 20th century will stand out in the history of medical science as the period in which serum therapeutics and serum diagnosis had their birth.

In recent years the relations of toxin and antitoxin, still obscure, have been the subject of much study and controversy. It was formerly supposed that the injection of attenuated cultures or dead organisms—vaccines in the widest sense—was only of service in producing immunity as a preventive measure against the corresponding organism, but the work of
Sir Almroth Wright has shown that the use of such vaccines may be of service even after infection has occurred, especially when the resulting disease is localized. In this case a general reaction is stimulated by the vaccine which may aid in the destruction of the invading organisms. In regulating the administration of such vaccines he has introduced the method of observing the opscon index, to which reference is made below. Of the discoveries of new organisms the most important is that of the Spirochaeta pallida in syphilis by Schaudinn and Hoffmann in 1905; and although proof that it is the cause of the disease is not absolute, the facts that have been established constitute very strong presumptive evidence in favour of this being the case. It may be noted, however, that it is still doubtful whether this organism is to be placed amongst the bacteria or amongst the protozoa.

The methods employed in studying the relation of bacteria to disease are in principle comparatively simple, but considerable experience and great care are necessary in applying them and in interpreting results. In any given disease there are three chief steps, viz. (1) the discovery of a bacterium in the affected tissues by means of the microscope; (2) the obtaining of the bacterium in pure culture; and (3) the production of the disease by inoculation with a pure culture.

By means of microscopic examination more than one organism may sometimes be observed in the tissues, but one single organism by its constant presence and special relations to the tissue changes can usually be selected as the probable cause of the disease, and attempts towards its cultivation can then be made. Such microscopic examination requires the use of the finest lenses and the application of various staining methods. In these latter the basic aniline dyes in solution are almost exclusively used, on account of their special affinity for the bacterial protoplasm. The methods vary much in detail, though in each case the endeavour is to colour the bacteria as deeply, and the tissues as faintly, as possible. Sometimes a simple watery solution of the dye is sufficient, but very often the best result is obtained by increasing the staining power, e.g. by addition of weak alkali, application of heat, &c., and by using some substance which acts as a mordant and tends to fix the stain to the bacteria.

Excess of stain is afterwards removed from the tissues by the use of decolorizing agents, such as acids of varying strength and concentration, alcohol, &c. Different bacteria behave very differently to stains; some take them up rapidly, others slowly, some resist decolorization, others are easily decolorized. In some instances the stain can be entirely removed from the tissues, leaving the bacteria alone coloured, and the tissues can then be stained by another colour. This is the case in the methods for staining the tubercle bacillus and also in Gram's method, the essential point in which latter is the treatment with a solution of iodine before decolorizing. In Gram's method, however, only some bacteria retain the stain, while others lose it. The tissues and fluids are treated by various histological methods, but, to speak generally, examination is made either in films smeared on glass cover-glasses, or in cultures of the bacteria in petri dishes, or by reconstructing sections cut by the microtome after suitable fixation and hardening of the tissue. In the case of any bacterium discovered, observation must be made in a long series of instances in order to determine its invariable presence.

In cultivating bacteria outside the body various media to serve as food material must be prepared and sterilized by heat.

The general principle in their preparation is to supply the nutrient for bacterial growth in a form as nearly similar as possible to that of the natural habitat of the organisms—in the case of pathogenic bacteria, the natural fluids of the body. The media are used either in a fluid or solid condition, the latter being obtained by a process of coagulation, or by the addition of a gelatinizing agent, and are placed in glass tubes or flasks plugged with cotton-wool. To mention examples, blood serum solidified at a suitable temperature is a highly suitable medium, and various media are made with extract of meat as a basis, with the addition of gelatin or agar as solidifying agents and of non-coagulable proteids (commercial "pep-tone") to make up for proteids lost by coagulation in the preparation. The reaction of the media must in every case be carefully attended to, a neutral or slightly alkaline reaction being, as a rule, most suitable; for delicate work it may be necessary to standardize the reaction by titration methods. The media from the store-flasks are placed in glass test-tubes or small flasks, protected from contamination by cotton-wool plugs, and are sterilized by heat. For most purposes the solid media are to be preferred, since bacterial growth appears as a discrete mass and accidental contamination can be readily recognized. Cultures are made by transferring by means of a sterile platinum wire a little of the material containing the bacteria to the medium. The tubes, after being thus inoculated, are kept at suitable temperatures, usually either at 37° C., the temperature of the body, or at about 20° C., a warm summer temperature, until growth appears. For maintaining a constant temperature incubators with regulating apparatus are used. Subsequent cultures or, as they are called, "subcultures," may be made by inoculating fresh tubes, and in this way growth may be maintained often for an indefinite period. The simplest case is that in which only one variety of bacterium is present, and a "pure culture" may then be obtained at once. When, however, several species are present together, means must be adopted for separating them. For this purpose various methods have been devised, the most important being the plate-method of Koch. In this method the bacteria are distributed in a gelatine or agar medium liquefied by heat, and the medium is then poured out on sterile glass plates or in shallow glass dishes, and allowed to solidify. Each bacterium capable of growth gives rise to a colony visible to the naked eye, and if the colonies are sufficiently apart, an inoculation can be made from any one to a tube of culture-medium and a pure culture obtained. Of course, in applying the method means must be adopted for suitably diluting the bacterial mixture. Another important method consists in inoculating an animal with some fluid containing the various bacteria. A pathogenic bacterium present may invade the body, and may be obtained in pure culture from the internal organs. This method applies especially to pathogenic bacteria whose growth on culture media is slow, e.g. the tubercle bacillus.

The full description of a particular bacterium implies an account not only of its microscopic characters, but also of its growth characters in various culture media, its biological properties, and the effects produced in animals by inoculation. To demonstrate readily its action on various substances, certain media have been devised. For example, various sugars—lactose, glucose, saccharose, &c.—are added to test the fermentative action of the bacterium on these substances; litmus is added to show changes in reaction, specially standardized media being used for estimating such changes; peptone solution is commonly employed for testing whether or not the bacterium forms indol; sterilized milk is used as a culture medium to determine whether or not it is curdled by the growth. Sometimes a bacterium can be readily recognized from one or two characters only, but a number of tests must be made before the species is determined. As our knowledge has advanced it has become abundantly evident that the so-called pathogenic bacteria are not organisms with special features, but that each is a member of a group of organisms possessing closely allied characters. From the point of view of evolution we may suppose that certain races of a group of bacteria have gradually acquired the power of invading the tissues of the body and producing disease. In the acquisition of pathogenic properties some of their original characters have become changed, but in many instances this has taken place only to a slight degree, and, furthermore, some of these changes are not of a permanent character. It is to be noted that in the case of bacteria we can only judge of organisms being of different species by the stability of the characters which distinguish them, and numerous examples might be given where their characters become modified by comparatively slight change in their environment. The cultural as well as the microscopic
characters of a pathogenic organism may be closely similar to other non-pathogenic members of the same group, and it thus comes to be a matter of extreme difficulty in certain cases to state what criterion should be used in differentiating varieties. The tests which are applied for this purpose at present are chiefly of two kinds. In the first place, such organisms may be differentiated by the chemical change produced by them in various culture media, e.g., by their fermentative action on various sugars, &c., though in this case such properties may become modified in the course of time. And in the second place, the various serum reactions to be described below have been called into requisition. It may be stated that the introduction of a particular bacterium into the tissues of the body leads to certain properties appearing in the serum, which are chiefly exerted towards this particular bacterium. Such a serum may accordingly within certain limits be used for differentiating this organism from others closely allied to it (vide infra).

The modes of cultivation described apply only to organisms which grow in presence of oxygen. Some, however, the strictly anaerobic bacteria—grow only in the absence of oxygen; hence means must be adopted for excluding this gas. It is found that if the medium be rendered anaerobic by means of a solid mordant growth of an anaerobic organism will take place, especially if the medium contains some reducing agent such as glucose. Such cultures are called "deep cultures." To obtain growth of an anaerobic organism on the surface of a medium, in using the plate method, and also for cultures in fluids, the air is displaced by an indifferent gas, usually hydrogen.

In testing the effects of bacteria by inoculation the smaller rodents, rabbits, guinea-pigs, and mice, are usually employed.

One great drawback in certain cases is that such animals are not susceptible to a given bacterium, or that the disease is different in character from that in the human subject. In some cases, e.g., Malta fever and relapsing fever, monkeys have been used with success, but in others, e.g., leprosy, none of the lower animals has been found to be susceptible. Discretion must therefore be exercised in interpreting negative results in the lower animals. For purposes of inoculation young vigorous cultures must be used. The bacteria are mixed with some indifferent fluid, or a fluid culture is employed. The injections are made by means of a hypodermic syringe into the subcutaneous tissue, into a vein, or into one of the serous sacs, or more rarely into some special part of the body. The animal, after injection, must be kept in favourable surroundings, and any resulting symptoms noted. It may die, or may be killed at any time desired, and then a post-mortem examination is made, the conditions of the organs, &c., being observed and noted. The various tissues affected are examined microscopically and cultures made from them; in this way the structural changes and the relation of bacteria to them can be determined.

Though the causal relationship of a bacterium to a disease may be completely established by the methods given, another very important part of bacteriology is concerned with the poisons or toxins formed by bacteria. These toxins may become free in the culture fluid, and the living bacteria may then be got rid of by filtering the fluid through a filter of unglazed porcelain, whose pores are sufficiently small to retain them. The passage of the fluid is readily effected by negative pressure produced by an ordinary water exhaust-pump. The effects of the filtrate are then tested by the methods used in pharmacology. In other instances the toxins are retained to a large extent within the bacteria, and in this case the dead bacteria are injected as a suspension in fluid. Methods have been introduced for the purpose of breaking up the bodies of bacteria and setting free the intracellular toxins. For this purpose Koch ground up tubercle bacilli in an agate mortar and treated them with distilled water until practically no deposit remained. Rowland and Macfadyen for the same purpose introduced the method of grinding the bacilli in liquid air. At this temperature the bacterial bodies are extremely brittle, and are thus readily broken up. The study of the nature of toxins requires, of course, the various methods of organic chemistry. Attempts to obtain them in an absolutely pure condition have, however, failed in important cases. So that when a "toxin" is spoken of, a mixture with other organic substances is usually implied. Or the toxin may be precipitated with other organic substances, purified to a certain extent by re-solution, re-precipitation, &c., and desiccated. A "dry toxin" is thus obtained, though still in an impure condition. Toxic substances have also been separated by corresponding methods from the bodies of those who have died of certain diseases, and the action of such substances on animals is in some cases an important point in the pathology of the disease. Another auxiliary method has been applied in this department, viz., the separation of organic substances by filtration under high pressure through a colloidal membrane, gelatine supported in the pores of a porcelain filter being usually employed. It has been found, for example, that a toxin may pass through such a filter while an antitoxin may not. The methods of producing immunity are dealt with below.

The fact that in anthrax, one of the first diseases to be fully studied, numerous bacilli are present in the blood of infected animals, gave origin to the idea that the organisms might produce their effect by using up the oxygen of the blood. This has been confirmed. But the action is in subsidiary matter. And although effects may sometimes be produced in a mechanical manner by bacteria plugging capillaries of important organs, e.g., brain and kidneys, it may now be stated as an accepted fact that all the important results of bacteria in the tissues are due to poisonous bodies or toxins formed by them. Here, just as in the general subject of fermentation, we must inquire whether the bacteria form the substances in question directly or by means of non-living fermenters or enzymes. With regard to toxin formation the following general statements may be made. In certain instances, e.g., in the case of the tetanus and diphtheria bacilli, the production of soluble toxins can be readily demonstrated by filtering a culture in bouillon germ-free by means of a porcelain filter, and then injecting some of the filtrate into an animal. In this way the characteristic features of the disease can be reproduced. Such toxins being set free in the culture medium are often known as extracellular. In many cases, however, the filtrate, when injected, produces comparatively little effect, whilst toxic action is observed when the bacteria in a dead condition are used; this is the case with the organisms of tubercle, cholera, typhoid and many others. The toxins are here manifestly contained within the bodies of the bacteria, i.e., are intracellular, though they may become free on disintegration of the bacteria. The action of these intracellular toxins has in many instances nothing characteristic, but is merely in the direction of producing fever and interfering with the vital processes of the body generally, these disturbances often going on to a fatal result. In other words, the toxins of different bacteria are closely similar in their results on the body and the features of the corresponding diseases are largely regulated by the vital properties of the bacteria, their distribution in the tissues, &c. The distinction between the two varieties of toxin, though convenient, must not be pushed too far, as we know little regarding their mode of formation. Although the formation of toxins with characteristic action can be shown by the above methods, in some cases little or no toxic action can be demonstrated. This, for example, is the case with the anthrax bacillus; although the effect of this organism in the living body indicates the production of toxins which diffuse for a distance around the bacteria. This and similar facts have suggested that some toxins are only produced in the living body. A considerable amount of work has been done in connexion with this subject, and many observers have found that fluids taken from the living body in which the organisms have been growing, contain toxic substances, to which the name of aggressins has been applied. Fluid containing these aggressins greatly increases the toxic effect of the corresponding bacteria, and may produce death at an earlier stage than ever occurs with the bacteria alone. They also appear to have in certain cases a paralyzing action on the cells which act as phagocytes.

BACTERIOLOGY

The separation of toxins. In the processes of phagocytosis, the white cells of the blood and the phagocytes of the tissues are exerted an action which is known as phagocytosis. The effect of the phagocytes is to destroy the bacteria and to remove the products of decomposition. It is evident, however, that the white cells cannot destroy the entire organism, and that some action is required in order to break the organisms into smaller particles. The process of phagocytosis is therefore followed by the process of digestion, in which the parts of the organism are acted on by the digestive juices of the phagocytes. The process of digestion is not a simple one, but is a complex series of changes which takes place in the phagocytes in order to enable them to destroy the bacteria and to remove the products of decomposition. The process of digestion is therefore followed by the process of absorption, in which the products of digestion are absorbed into the blood. The process of absorption is therefore followed by the process of excretion, in which the products of absorption are excreted from the body. The process of excretion is therefore followed by the process of regeneration, in which the products of excretion are renewed. The process of regeneration is therefore followed by the process of growth, in which the products of regeneration are increased in amount. The process of growth is therefore followed by the process of development, in which the products of growth are increased in complexity. The process of development is therefore followed by the process of differentiation, in which the products of development are increased in variety. The process of differentiation is therefore followed by the process of specialization, in which the products of differentiation are increased in function. The process of specialization is therefore followed by the process of adaptation, in which the products of specialization are increased in fitness. The process of adaptation is therefore followed by the process of evolution, in which the products of adaptation are increased in variety. The process of evolution is therefore followed by the process of selection, in which the products of evolution are increased in fitness. The process of selection is therefore followed by the process of mutation, in which the products of selection are increased in variety. The process of mutation is therefore followed by the process of variation, in which the products of mutation are increased in fitness. The process of variation is therefore followed by the process of propagation, in which the products of variation are increased in number.
work on this subject is highly suggestive, and opens up new possibilities with regard to the investigation of bacterial action within the body. Not only are the general symptoms of poisoning in bacterial disease due to toxic substances, but also the tissue changes, many of them of inflammatory nature, in the neighbourhood of the bacteria. Thus, to mention examples, diphtheria toxin produces inflammatory oedema which may be followed by necrosis; dead tubercle bacilli give rise to a tubercle-like nodule, &c. Furthermore, a bacillus may give rise to more than one toxic body, either as stages in one process of change or as distinct products. Thus paralysis following diphtheria is in all probability due to a different toxin from that which causes the acute symptoms of poisoning or possibly to a modification of it sometimes formed in specially large amount. It is interesting to note that in the case of the closely analogous example of snake venoms, there may be separated from a single venom a number of toxic bodies which have a selective action on different animal tissues.

Regarding the chemical nature of toxins less is known than regarding their physiological action. Though an enormous amount of work has been done on the subject, no important bacterial toxin has as yet been obtained in a pure condition, and, though many of them are probably of a proteid nature, even this cannot be asserted with absolute certainty. Bierger, in his earlier work, found that alkaloids were formed by bacteria in a variety of conditions, and that some of them were poisonous. These alkaloids he called *phomaines*. The methods used in the investigations were, however, open to objection, and it is now recognized that although organic bases may sometimes be formed, and may be toxic, the important toxins are not of that nature. A later research by Bierger along with Fraenkel pointed to the extracellular toxins of diphtheria, tetanus and other diseases being of proteid nature, and various other observers have arrived at a like conclusion. The general result of such research has been to show that the toxic bodies are, like proteids, precipitable by alcohol and various salts; they are soluble in water, are somewhat easily dialysable, and are relatively unstable both to light and heat. Attempts to get a pure toxin by repeated precipitation and solution have resulted in the production of a whitish amorphous powder with highly toxic properties. Such a powder gives a proteid reaction, and is no doubt largely composed of albumoses, hence the name *toxalbumoses* has been applied. The question has, however, been raised whether the toxin is really itself a proteid, or whether it is not merely carried down with the precipitate. Some of the toxins may be precipitated by precipitation with certain salts, notably of zinc, obtained a body which was toxic but gave no reaction of any form of proteid. There is of course the possibility in this case that the toxin was a proteid, but was in so small amount that it escaped detection. These facts show the great difficulty of the problem, which is probably insoluble by present methods of analysis; the only test, in fact, for the existence of a toxin is its physiological effect. It may also be mentioned that many toxins have now been obtained by growing the particular organism in a proteid-free medium, a fact which shows that if the toxin is a proteid it may be formed synthetically by the bacterium as well as by modification of proteid already present. With regard to the nature of intracellular toxins, there is even greater difficulty in the investigation and still less is known. Many of them, probably also of proteid nature, are much more resistant to heat; thus the intracellular toxins of the tubercle bacillus retain certain of their effects even after exposure to 100° C. Like the extracellular toxins they may be of remarkable potency; for example, fever is produced in the human subject by the injection into the blood of an extremely minute quantity of dead typhoid bacilli.

We cannot as yet speak definitely with regard to the part played by enzymes in these toxic processes. Certain toxins resemble enzymes as regards their conditions of precipitation and relative instability, and the fact that in most cases a considerable period intervenes between the time of injection and the occurrence of symptoms has been adduced in support of the view that enzymes are present. In the case of diphtheria Sidney Martin obtained toxic albumoses in the spleen, which he considered were due to the digestive action of an enzyme formed by the bacillus in the membrane and absorbed into the circulation. According to this view, then, a part at least of the directly toxic substance is produced in the living body by enzymes present in the so-called toxin obtained from the bacterial culture. Recent researches go to show that enzymes play a greater part in fermentation by living ferments than was formerly supposed, and by analogy it is likely that they are also concerned in the processes of disease. But this has not been proved, and hitherto no enzyme has been separated from a pathogenic bacterium capable of forming, by digestive or other action, the toxic bodies from proteids outside the body. It is also to be noted that, as in the case of poisons of known constitution, each toxin has a minimum lethal dose which is proportionate to the weight of the animal and which can be ascertained with a fair degree of accuracy.

The action of toxins is little understood. It consists in all probability of disturbance, by means of the chemical affinities of the toxin, of the highly complicated molecules of living cells. This disturbance results in disintegration to a varying degree, and may produce changes visible on microscopic examination. In other cases such changes cannot be detected, and the only evidence of their occurrence may be the associated symptoms. The very important work of Ehrlich on diphtheria toxin shows that a minute quantity of a certain toxin from a single strain of bacteria—one, the "hapthorphan," by which the toxin molecule is attached to the cell protoplasm; and the other the "toxophorphan," which has a ferment-like action on the living molecule, producing a disturbance which results in the toxic symptoms. On this theory, susceptibility to a toxin will imply both a chemical affinity of certain tissues for the toxin molecule and also sensitiveness to its actions, and, furthermore, non-susceptibility may result from the absence of either of these two properties.

A bacterial infection when analysed is seen to be of the nature of an intoxication. There is, however, another all-important factor concerned, viz. the multiplication of the living organisms in the tissues; this is essential to, and regulates, the supply of toxins. It is important that these two essential factors should be kept clearly in view, since the means of defence against any disease may depend upon the power either of neutralizing toxins or of killing the organisms producing them. It is to be noted that there is no fixed relation between toxin production and bacterial multiplication in the body, some of the organisms most active as toxin producers having very little power of invading the tissues.

We shall now consider how bacteria may behave when they have gained entrance to the body, what effects may be produced, and what circumstances may modify the disease in any particular case. The extreme instance of bacterial invasion is found in some of the septicaemias in the lower animals, e.g. anthrax septicaemia in guinea-pigs, pneumococcus septicaemia in rabbits. In such diseases the bacteria, when introduced into the subcutaneous tissue, rapidly gain entrance to the blood stream and multiply freely in it, and by means of their toxins cause symptoms of general poisoning. A widespread toxic action is indicated by the lesions found—cloudy swelling, which may be followed by fatty degeneration, in internal organs, capillary haemorrhages, &c. In septicemia in the human subject, often due to streptococci, the process is similar, but the organisms are found especially in the capillaries of the internal organs and may not be detectable in the peripheral circulation during life. In another class of diseases, the organisms first produce some well-marked local lesion, from which secondary extension takes place by the lymph or blood stream to other parts of the body, where corresponding lesions are formed. In this way secondary abscesses, secondary tubercle glands and nodules, &c., result; in typhoid fever there is secondary invasion of the mesenteric glands, and clumps of bacilli are also found in internal organs, especially the spleen, though there may be little tissue change around them. In all such cases there is seen a selective character in the distribution of the lesions, some organs being in any disease much more liable to infection than others. In still
another class of diseases the bacteria are restricted to some particular part of the body, and the symptoms are due to toxins which are absorbed from it. Thus in cholera the bacteria are practically confined to the intestine, in diphtheria to the region of the false membrane, in tetanus to some wound. In the last-mentioned disease even the local multiplication depends upon the presence of other bacteria, as the tetanus bacillus has practically no power of multiplying in the healthy tissues when introduced alone.

The effects produced by bacteria may be considered under the following heads: (1) tissue changes produced in the vicinity of the bacteria, either at the primary or secondary foci; (2) tissue changes produced at a distance by absorption of their toxins; (3) symptoms. The changes in the vicinity of bacteria are to be regarded partly as the direct result of the action of toxins on living cells, and partly as indicating a reaction on the part of the tissues. (Many such changes are usually grouped together under the heading of "inflammation" of varying degree—acute, subacute and chronic.) Degeneration and death of cells, haemorrhages, serous and fibrinous exudations, leucocyte emigration, proliferation of connective tissue and other cells, may be mentioned as some of the fundamental changes. Acute inflammation of various types, suppuration, gangrene-tissue separation, &c., represent some of the complex resulting processes. The changes extend at a distance by distribution of toxins may be very manifold—cloudy swelling and fatty degeneration, serous effusions, capillary haemorrhages, various degenerations of muscle, hyaline degeneration of small blood-vessels, and, in certain chronic diseases, waxy degeneration, all of which may be widespread, are examples of the effects of toxins, rapid or slow in action. Again, in certain cases the toxin has a special affinity for certain tissues. Thus in diphtheria changes in both nerve cells and nerve fibres have been found, and in tetanus minute alterations in the nucleus and protoplasm of nerve cells.

The lesions mentioned are in many instances necessarily accompanied by functional disturbances or clinical symptoms, varying according to site, and to the nature and degree of the affection. In addition, however, there occur in bacterial diseases symptoms to which the correlated structural changes have not yet been demonstrated. Amongst these the most important is fever with increased protein metabolism, attended with changes in the circulatory and respiratory systems. Nervous symptoms, somnolence, delirium, convulsions and paralysis are of common occurrence, though phenomena, however, are likewise due to the disturbance of the molecular constitution of living cells. Alterations in metabolism are found to be associated with some of these, but with others no corresponding physical change can be demonstrated. The action of toxins on various glands, producing diminished or increased functional activity, has a close analogy to that of certain drugs. In short, if we place aside the outstanding exception of tumour growth, we may say that practically all the important phenomena met with in disease may be experimentally produced by the injection of bacteria or of their toxins.

The result of the entrance of a virulent bacterium into the tissues of an animal is not a disease with hard and fast characters, but varies greatly with circumstances. With regard to the subject of infection the chief factor is susceptibility; with regard to the bacterium virulence is all-important. Susceptibility, as is well recognized, varies much under natural conditions in different species, in different races of the same species, and amongst individuals of the same race. It also varies with the period of life, young subjects being more susceptible to certain diseases, e.g., diphtheria, than adults. Further, there is the very important factor of acquired susceptibility. It has been experimentally shown that conditions such as fatigue, starvation, exposure to cold, &c., lower the general resisting powers and increase the susceptibility to bacterial infection. So also the local powers of resistance may be lowered by injury or depressed vitality. In this way conditions formerly believed to be the causes of disease are now recognized as playing their part in predisposing to the action of the true causal agent, viz., the bacterium. In health the blood and internal tissues are bacterium-free; after death they offer a most suitable habitation for various bacteria; but between these two extremes lie states of varying liability to infection. It is also probable that in a state of health organisms do gain entrance to the blood from time to time and are rapidly killed off. The circumstances which alter the virulence of bacteria will be referred to again in connexion with immunity, but it may be stated here that, as a general rule, the virulence of an organism towards an animal is increased by sojourn in the tissues of that animal. The increase of virulence becomes especially marked when the organism is inoculated from animal to animal in series, the method of passage. This is chiefly to be regarded as an adaptation to surroundings, though the fact that the less virulent members of the bacterial species will be liable to be killed off also plays a part. Conversely, the virulence tends to diminish on cultivation on artificial media outside the body, especially in circumstances little favourable to growth.

By immunity is meant non-susceptibility to a given disease, or to experimental inoculation with a given bacterium or toxin. The term must be used in a relative sense, and accounts must always be taken of the conditions present. An animal may be readily susceptible to a disease on experimental inoculation, and yet, and yet, or may or may not suffer from it naturally, because the necessary conditions of infection are not supplied in nature. That an animal possesses natural immunity can only be shown on exposing it to such conditions, this being usually most satisfactorily done in direct experiment. Further, there are various degrees of immunity, and in this connexion conditions of local or general diminished vitality play an important part in increasing the susceptibility. Animals naturally susceptible may acquire immunity, on the one hand by successfully passing through an attack of the disease, or, on the other hand, by various methods of inoculation. Two chief varieties of artificial immunity are now generally recognized, differing chiefly according to the mode of production. In the first—active immunity—a reaction or series of reactions is produced in the body of the animal, usually by injections of bacteria or their products. The second—passive immunity—is produced by the transference of a quantity of the serum of an animal actively immunized to a fresh animal; the term is applied because there is brought into play no active change in the tissues of the second animal. The methods of active immunity have been practically applied in protective inoculation against disease; those of passive immunity have given us serums therapeutics. The chief facts with regard to each may now be stated.

1. Active Immunity.—The key to the artificial establishment of active immunity is given by the fact long established that recovery from an attack of certain infective diseases is accompanied by protection for varying periods of time against a subsequent attack. Hence follows the idea of producing a modified attack of the disease as a means of prevention—a principle which had been previously applied in inoculation against smallpox. Immunity, however, probably results from certain substances introduced into the system during the disease rather than from the disease itself; for by properly adjusted doses of the poison (in the widest sense), immunity may result without any symptoms of the disease occurring. Of the chief methods used in producing active immunity the first is by inoculation with bacteria whose virulence has been diminished, i.e., with an "attenuated virus." Many of the earlier methods of attenuation were devised in the case of the anthrax bacillus, an organism which is, however, somewhat exceptional as regards the relative stability of its virulence. Many such methods consist, to speak generally, in growing the organism outside the body under somewhat unsuitable conditions, e.g., at higher temperatures than the optimum, in the presence of weak antiseptics, &c. The virulence of many organisms, however, becomes diminished when they are grown on the ordinary artificial media, and the diminution is sometimes accelerated by passing a current
of air over the surface of the growth. Sometimes also the virulence of a bacterium for a particular kind of animal becomes lessened on passing it through the body of one of another species. Cultures of varying degree of virulence may be obtained by such methods, and immunity can be gradually increased by inoculation with vaccines of increasing virulence. The immunity may be made to reach a very high degree by ultimately using cultures of intensified virulence, this "supervirulent" character being usually attained by the method of passage already explained. A second method is by injection of the bacterium in the dead condition, whereby immunity against the living organism may be produced. Here manifestly the dose may be easily controlled, and may be gradually increased in successive inoculations. This method has a wide application. A third method is by injections of the separated toxins of a bacterium, the resulting immunity being not only against the toxin, but, so far as present knowledge shows, also against the living organism. In the development of toxin-immunity the doses, small at first, are gradually increased in successive inoculations; or, as in the case of very active toxins, the initial injections are made with toxin modified by heat or by the addition of various chemical substances. Immunity against the toxin can be acquired in the same way against snake and scorpion poisons, and against certain vegetable toxins, e.g. ricin, abrin, &c.

In order that the immunity may reach a high degree, either the bacterium in a very virulent state or a large dose of toxin must ultimately be used in the injections. In such cases the immunity is, to speak generally, specific, i.e. applies only to the bacterium or toxin used in its production. A certain degree of non-specific immunity or increased tissue resistance may be produced locally, e.g. in the peritoneum, by injections of non-pathogenic organisms, peptone, nucleic acid and various other substances. In these cases the immunity is without specific character, and cannot be transferred to another animal. Lastly, in a few instances one organism has an antagonistic action to another; for example, the products of B. pyocyanea have a certain protective action against B. anthracis. This method has, however, not yielded any important practical application.

2. Passive Immunity: Anti-sera.—The development of active immunity by the above methods is essentially the result of a reaction of the first kind. The first part of the body, so far as yet we know little of its real nature. It is, however, also accompanied by the appearance of certain bodies in the blood serum of the animal treated, to which the name of anti-substances is given, and these have been the subject of extensive study. It is by means of them that immunity (passive) can be transferred to a fresh animal. The development of anti-substances is, however, not peculiar to bacteria, but occurs also when alien cells of various kinds, proteins, ferments, &c., are injected. In fact, organic molecules can be divided into two classes according as they give rise to anti-substances or fail to do so. Amongst the latter, the vegetable poisons of known constitution, alkaloids, glucosides, &c., are to be placed. The molecules which lead to the production of anti-substances are usually known as antigens, and each antigen has a specific combining affinity for its corresponding anti-substance, fitting it as a lock does a key. The antigens, as already indicated, may occur in bacteria, cells, &c., or they may occur free in a fluid. Anti-substances may be arranged, as has been done by Ehrlich, into three main groups. In the first group, the anti-substance is simply combined with the antigen, without, so far as we know, producing any change in it.

The anti-substances are examples of this variety. In the second group, the anti-substance, in addition to combining with the antigen, produces some recognizable physical change in it; the precipitins and agglutinins may be mentioned as examples. In the precipitins group, the anti-substance, after it has combined with the antigen, leads to the union of a third body called complement (alexine or cytone of French writers), which is present in normal serum. As a result of the union of the three substances, a dissolving or digestive action is often to be observed. This is the mode of action of the anti-substances in the case of a haemolytic or bacteriolysic serum. So far as bacterial immunity is concerned, the anti-serum exerts its action either on the toxin or on the bacterium itself; that is, its action is either anitoxic or anti-bacterial. The properties of these two kinds of serum may now be considered.

The term "antitoxic" signifies that serum has the power of neutralizing the action of the toxin, as is shown by mixing them together outside the body and then injecting them into an animal. The antitoxic serum when injected previously to the toxin also confers immunity (passive) against it; when injected after the toxin it has within certain limits a curative action, though in this case its dose requires to be large. The antitoxic property is developed in a susceptible animal by successive and gradually increasing doses of the toxin. In the earlier experiments on smaller animals the potency of the toxin was modified for the first injections, but in preparing antitoxin for therapeutic purposes the toxin is used in its unaltered condition, the horse being the animal usually employed. The injections are made subcutaneously and afterwards intravenously; and, while the dose must be gradually increased, care must be taken that this is not done too quickly, otherwise the antitoxin power of the serum may fall and the health of the animal suffer. The quantity of the animal is acted on from time to time against a known amount of toxin, i.e. is standardized. The unit of antitoxin in Ehrlich's new standard is the amount requisite to antagonize 100 times the minimum lethal dose of a particular toxin to a guinea-pig of 250 grm. weight, the indication that the toxin has been antagonized being that a fatal result does not follow within five days after the injection. In the case of diphtheria the antitoxic power of the serum may reach 800 units per cubic centimetre, or even more. The laws of antitoxin production and action are not confined to bacterial toxins, but apply also to other vegetable and animal toxins, resembling them in constitution, viz. the vegetable toxalbumoses and the snake-venom group referred to above.

The production of antitoxin is one of the most striking facts of biological science, and two important questions with regard to it must next be considered, viz. how does the antitoxin act? and how is it formed within the body? Theoretically there are two possible modes of action: antitoxin may act by means of the cells of the body, i.e. inorganic, or by the cells, or inorganic, and by means of the body. For, while it is possible that toxins may be neutralized by the antitoxin through chemical or physical action. The second view may now be said to be established, and, though the question cannot be fully discussed here, the chief grounds in support of a direct action may be given. (a) The action of antitoxin on toxin, as tested by neutralization effects, takes place more quickly in concentrated than in weak solutions, and more quickly at a warm (within certain limits) than at a cold temperature. (b) Antitoxin acts more powerfully when injected along with the toxin than when injected at the same time in another part of the body; if its action were on the tissue-cells one would expect that the site of injection would be immaterial. For example, the amount necessary to neutralize five times the lethal dose being determined, twenty times that amount will neutralize a hundred times the lethal dose. In the case of physiological antagonism of drugs this relationship does not hold. (c) It has been shown by C. J. Martin and Cherry, and by A. A. Kandhak and Cobbett, that in certain instances the toxin can be made to pass through a gelatine membrane, whereas the antitoxin cannot, its molecules being of larger size. If, however, toxin be mixed with antitoxin for some time, it can no longer be passed through, presumably because it has become combined with the antitoxin.

Lastly it may be mentioned that when a toxin has some action which can be demonstrated in a test-tube experiment, for example, a dissolving action on red corpuscles, this action may be annulled by previously adding the antitoxin to toxin; in such a case the intervention of the living tissues is excluded. In view of the fact that antitoxin has a direct action on toxin, we may say that theoretically this may take place in one of two ways. It may produce a disintegration of the toxin molecule, or it may combine with it to produce a body whose combining affinities are satisfied. The latter view, first advocated by
Ehrlich, harmonizes with the facts established with regard to toxic action and the behaviour of antitoxins, and may now be regarded as established. His view as to the dual composition of the toxin molecule has already been mentioned, and it is evident that if the haptothorous or combination group has its affinity satisfied by union with antitoxin, the toxin will no longer combine with living cells, and will thus be rendered harmless. One other important fact in support of what has been stated is that a toxin may have its toxic action diminished, and may still require the same amount of antitoxin as previously for neutralization. This is readily intelligible on the supposition that the toxophorous group is more labile than the haptothorous. There is, however, still dispute with regard to the exact nature of the union of toxin and antitoxin. Ehrlich's view is that the two substances form a firm combination like a strong acid and a base. He found, however, that if he took the largest amount of toxin which was just neutralized by a given amount of antitoxin, much more than a single dose of toxin had to be added before a single dose was left free. For example, if 100 doses of toxin were neutralized by a unit of antitoxin (a. supra) it might be that 125 doses would need to be added to the same amount of antitoxin before the mixture produced a fatal result when it was injected. This was usually known as the "secondary toxophorus phenomenon," was explained by him on the supposition that the "toxin " does not represent molecules which are all the same, but contains molecules of different degrees of combining affinity and of toxic action. Accordingly, the most actively toxic molecules will be neutralized first, and those which are left over, that is, uncombined with antitoxin, will have a weaker toxic action. This view has been assailed by Thorvald Madsen and S. A. Arrhenius, who hold that the union of toxin and antitoxin is comparatively loose, and belongs to the class of reversibleractions, being comparable in fact with the union of a weak acid and base. If such were the condition there would always be a certain amount both of free toxin and of free antitoxin in the mixture, and in this case also considerably more than a dose of toxin would have to be added to a "neutral mixture" before the amount of free toxin was increased by a dose, that is, before the mixture became lethal. It may be stated that while in any instances the union of toxin and antitoxin may be reversible, the fact was not established and cannot be explained on this view. The hypothesis of reversible action, Stieglitz's view, advocated by Bordet, is that the union of toxin and antitoxin is rather of physical than of strictly chemical nature, and represents an interaction of colloidal substances, a sort of molecular deposition by which the smaller toxin molecule becomes entangled in the larger molecule of antitoxin. Sufficient has been said to show that the subject is one of great intricacy, and no simple statement with regard to it is as yet possible. We are probably safe in saying, however, that the molecules of a toxin are not identical but vary in the degree of their combining affinities, and also in their toxic action, and that, while in some cases the combination of anti-substances has been shown to be reversible, we are far from being able to say that this is a general law.

The origin of antitoxin is of course merely a part of the general question regarding the production of anti-substances in general, as these all combine in the same way with their homologous substances and have the same character of specificity. As, however, most of the work has been done on antitoxin producing action we may consider here the theoretical aspect of this subject. There are three chief possibilities: (a) that the antitoxin is a modification of the toxin; (b) that it is a substance normally present, but produced in excess under stimulation of the toxin; (c) that it is an entirely new product. The first of these, which would imply a process of a very remarkable nature, is disproved by what is observed after bleeding an animal whose blood contains antitoxin. In such a case it has been shown that, without the introduction of fresh toxin, new antitoxin appears, and therefore must be produced by the living tissues. The second theory is the more probable a priori, and if established removes the necessity for the third. It is strongly supported by Ehrlich, who, in his so-called "side-chain" (Seitenkette) theory, explains antitoxin production as an instance of regeneration after loss. Living protoplasm, or in other words a biogen molecule, is regarded as consisting of a central atom group (Leistungskern), related to which are numerous secondary atom groups or side-chains, with unsatisfied chemical affinities. The side-chains constitute the means by which other molecules are added to the living molecule, e.g., in the process of nutrition. It is by means of such side-chains that toxin molecules are attached to the protoplasm, so that the living molecules are brought under the action of the toxophorous groups of the toxins. In antitoxin production this combination takes place, though not in sufficient amount to produce serious toxic symptoms. It is further supposed that the combination being of somewhat firm character, the side-chains thus combined are lost for the purposes of the cell and are therefore thrown off. By the introduction of fresh toxin the process is repeated and the regeneration of side-chains is increased. Ultimately the regeneration becomes an over-regeneration and free side-chains produced in excess are set free and appear in the blood as antitoxin molecules. In other words the substances, which in the process of the side-chain theory constitute antitoxin molecules when free in the serum, are regarded as being a part of the protoplasm capacity for the production of toxins. In this theory, though not yet established, certainly affords the most satisfactory explanation at present available. In support of it there is the remarkable fact, discovered by A. Wassermann and Takaki in the case of tetanus, that there do exist in the nervous system molecules with combing affinity for the tetanus toxin. If, for example, the brain and spinal cord removed from an animal be bruised and brought into contact with tetanus toxin, a certain amount of the toxicity disappears, as shown by injecting the mixture into another animal. Further, these molecules in the nervous system present the same susceptibility to heat and other physical agencies as does tetanus antitoxin. There is therefore strong evidence that antitoxin molecules do exist as part of the living substance of nerve cells. It has, moreover, been found that the serum of various animals has a certain amount of antitoxic action, and thus the basis for antitoxin production, according to Ehrlich's theory, is afforded. The theory also supplies the explanation of the power which an antitoxin possesses in producing various antitoxins, since this depends ultimately upon susceptibility to transformation. The explanation is thus carried back to the complicated constitution of biogen molecules in various living cells of the body. It may be added that in the case of all the other kinds of anti-substances, which are produced by a corresponding reaction, we have examples of the existence of traces of them in the blood serum under normal conditions. We are, accordingly, justified in infinitely concluding that their appearance in large amount in the blood, as the result of active immunization, represents an increased production of molecules which are already present in the body, either in a free condition in its fluids or as constituent elements of its cells.

In preparing anti-bacterial sera the lines of procedure correspond to those followed in the case of antitoxins, but the bacteria themselves in the living or dead condition or their maceration products are always used in the injections. Sometimes dead bacteria, living virulent bacteria, and living supervirulent bacteria, are used in succesion, the object being to arrive ultimately at a high dosage, which will produce in sufficient instances. The serum of an animal thus actively immunized has powerful protective properties towards another animal, the amount necessary for protection being sometimes almost inconceivably small. As a rule it has no action on the corresponding toxin, i.e., is not antitoxic. In addition to the protective action, such a serum may possess activities which can be demonstrated outside the body. Of these the most important are (a) bacterolytic or lysogetic action, (b) agglutinative action, and (c) opsonic action.

The first of these, lysogetic or bacterolytic action, consists in
the production of a change in the corresponding bacterium whereby it becomes granular, swells up and ultimately may undergo dissolution. Pfeiffer was the first to show that this occurred when the bacterium was injected into the peritoneal cavity of the animal immunized against it, and also when a little of the serum of such an animal with the bacterium into the peritoneum of a fresh, i.e. non-immunized animal. Metchnikoff and Bordet subsequently devised means by which a similar change could be produced in vitro, and analysed the conditions necessary for its occurrence. It has been completely established that in this phenomenon of lysogenesis there are two substances concerned, one specially developed or developed in excess, and the other present in normal serum. The former (Immunikörper of Ehrlich, substance sensibilisatrice of Bordet) is the more stable, resisting a temperature of 60° C, and though giving the specific character to the reaction cannot act alone. The latter is ferment-like and much more labile than the former, being readily destroyed at 60° C. It may be added that the protective power is not lost by exposure to the temperature mentioned, this apparently depending upon a specific anti-substance. Furthermore, lysogenic action is not confined to the case of bacteria but obtains also with other organized structures, e.g. red corpuscles (Bordet, Ehrlich and Morgenroth), leucocytes and spermatogonia (Metchnikoff's action). An important point is that with injections of these bodies, its serum acquires the power of dissolving or of producing some disintegrative effect in them. The development of the immune body with specific combining affinity thus presents an analogy to antitoxin production, the difference being that in lysogenesis another substance is necessary to complete the process. It can be shown that in many cases when bacteria are injected the serum of the treated animal has no bacteriolytic effect, and still an immune body is present, which leads to the fixation of complement; in this case bacteriolytic does not occur, because the organism is not susceptible to the action of the complement. In all cases the important action is the binding of complement to the bacterium by means of the corresponding immune body; whether or not death of the bacterium occurs, will depend upon its susceptibility to the action of the particular complement, the latter acting like a toxin or digestive ferment. It is to be noted that in the process of immunization complement does not increase in amount, accordingly the immune serum comes to contain immune body much in excess of the amount of complement necessary to the complementation of the immune serum. It is concluded that the therapeutic application of an anti-bacterial serum, is that when the serum is kept in vitro the complement rapidly disappears, and accordingly the complement necessary for the production of the bactericidal action must be supplied by the blood of the patient treated. This latter complement may not suit the immune body, that is, may not be fixed to the bacterium by means of it, or if the latter event does occur, may fail to bring about the death of the bacteria. These circumstances serve, in part at least, to explain the fact that the success attending the use of anti-bacterial sera has been much inferior to that in the case of antitoxin sera.

Another property which may be possessed by an anti-bacterial serum is that of agglutination. By this is meant the aggregation into clumps of the bacteria uniformly distributed in an indifferent fluid; if the bacterium is motile its movement is arrested during the process. The process is of course observed by means of the microscope, but the clumps soon settle in the fluid and ultimately form a sediment, leaving the upper part clear. This change, visible to the naked eye, is called sedimentation. B. J. A. Charrin and G. E. H. Roger first showed in the case of Be. pyocyanus that when a small quantity of the homologous serum (i.e. the serum of an animal immunized against the bacterium) was added to a fluid culture of this bacillus, growth formed a sediment instead of a uniform turbidity. Gruber and Durham showed that sedimentation occurred when a small quantity of the homologous serum was added to an emulsion of the bacterium in a small test-tube, and found that this obtained in all cases where Pfeiffer's lysogenic action could be demonstrated. Shortly afterwards Widal and also Grünbaum showed that the serum of patients suffering from typhoid fever, even at an early stage of the disease, agglutinated the typhoid bacillus—a fact which laid the foundation of serum diagnosis. A similar phenomenon has been demonstrated in the case of Malta fever, cholera, plague, infection with B. coli, "meat-poisoning" due to Gärnter's bacillus, and various other infections. As regards the mode of action of agglutinins, Gruber and Durham considered that it consists in a change in the envelopes of the bacteria, by which they swell up and become adhesive. The view has various facts in its support, but F. Kruse and C. Nicolle have found that if a bacterial culture be filtered germ-free, an agglutinating serum still produces some change in it, so that particles suspended it become gathered into clumps. E. Duclaux, for this reason, considers that agglutinins are coagulative ferments.

The phenomenon of agglutination depends essentially on the union of molecules in the bacteria—the agglutinogens—with the corresponding agglutinins, but another essential is the presence of a certain amount of salts in the fluid, as it can be shown that when agglutinated masses of bacteria are washed salt-free the clumps become resolved. The fact that agglutinins appear in the body at an early stage in a disease has been taken by some observers as a sign of an early change in the body with a corresponding immunity, their development being spoken of as a reaction of infection. This conclusion is not justified, as we must suppose that the process of immunization begins to be developed at an early period in the disease, that it gradually increases, and ultimately results in cure. It should also be stated that agglutinins are used up in the process of agglutination, apparently combining with some element of the bacterial structure. In view of all the facts it must be admitted that the agglutinins and immune bodies are the result of corresponding reactive processes, and are probably related to one another. The development of all antagonistic substances which confer the special character on antimicrobic sera, as well as antitoxins, may be expressed as the formation of bodies with specific combining affinity for the organic substance introduced into the system—toxin, bacterium, red corpuscle, &c., as the case may be. The bacterium, being a complex organic substance, may thus give rise to more than one antagonistic or combining substance.

By opsonic action is meant the effect which a serum has on bacteria in making them more susceptible to phagocytosis by the leucocytes. An important point is that with injections of these bodies, its serum acquires the power of disposing of or of producing some disintegrative effect in them. Another fact is that this property may be demonstrated outside the body by making a suitable mixture of (a) a suspension of the particular bacterium, (b) the serum to be tested, and (c) leucocytes of a normal animal or person. The mixture is placed in a thin capillary tube and incubated at 37° C. for half an hour; a film preparation is then made from it on a glass slide, stained by a suitable method and then examined microscopically. The number of bacteria contained within a number of, say fifty, leucocytes can be counted and the average taken. In estimating the opsonic power of the serum in cases of disease a control with normal serum is made at the same time and under precisely the same conditions. The average number of bacteria contained within leucocytes in the case tested, divided by the number given by the normal serum, is called the phagocytic index. Wright and Douglas showed that under these conditions phagocytosis might occur when a small quantity of normal serum was present, whereas it was absent when normal salt solution was substituted for the serum; the latter thus contained substances which made the organisms susceptible to the action of the phagocytes. They further showed that this substance acted by combining with the organisms and apparently producing some alteration in them; on the other hand it had no direct action on the leucocytes. This opsonin of normal serum is very labile, being rapidly destroyed at 55° C.; that is, a serum heated at this temperature has practically no greater effect in aiding phagocytosis than normal salt solution has. Various observers had previously found that the serum of an animal immunized against
a particular bacterium had a special action in bringing about phagocytosis of that organism, and it had been found that this property was retained when the serum was heated at 95°C. It is now generally admitted that at least two distinct classes of substances are concerned in opsonic action, that thermostable immune opsonins are developed as a result of active immunization and these possess the specific properties of anti-substances in general, that is, act only on the corresponding bacterium. On the contrary the labile opsonins of normal serum have a comparatively general action on different organisms. It is quite evident that the specific immune-opsonins may play a very important part in the phenomena of immunity, as by their means the organisms are taken up more actively by the phagocytic cells, and thereafter may undergo rapid disintegration.

The opsonic action of the serum has been employed by Sir A. Wright and his co-workers to control the treatment of bacterial infections by vaccines; that is, by injections of varying amounts of a dead culture of the corresponding bacterium. The object in such treatment is to raise the opsonic index of the serum, this being taken as an indication of increased immunity. The effect of such injections is that a small quantity of vaccine is usually sufficient to produce an increase in the opsonic index within a few days. If then an additional quantity of vaccine is injected there occurs a fall in the opsonic index (negative phase) which, however, is followed later by a rise to a higher level than before. If the amounts of vaccine used and the times of the injection are suitably chosen, there may thus be produced by a series of steps a rise of the opsonic index to a high level. One of the chief objects in registering the opsonic power in such cases is to avoid the introduction of additional vaccine when the opsonic index is low, that is, during the negative phase, as if this were done a further diminution of the opsonic action might result. The principle in such treatment by means of vaccines is to stimulate the general production of anti-substances throughout the body, so that these may be carried to the sites of bacterial growth, and aid the destruction of the organisms by means of the cells of the tissues. A large number of favourable results obtained by such treatment controlled by the observation of the opsonic index have already been published, but it would be unwise at present to offer a decided opinion as to the ultimate value of the method.

Active immunity has thus been shown to be associated with the presence of certain anti-substances in the serum. After these substances have disappeared, however, as they always do in the course of time, the animal still possesses immunity for a varying period. This apparently depends upon some alteration in the cells of the body, but its exact nature is not known.

The destruction of bacteria by direct cellular agency both in natural and acquired immunity must not be overlooked.

**Phagocytosis.** In infective conditions Metchnikoff placed great importance on phagocytosis. In this process there are two factors concerned, viz. the ingestion of bacteria by the cells, and the subsequent intracellular digestion. If either of these is wanting or interfered with, phagocytosis will necessarily fail as a means of defence. As regards the former, leucocytes are guided by chemiotaxis, i.e. by sensitivity to chemical substances in their surroundings—a property which is not peculiar to them but is possessed by various unicellular organisms, including motile bacteria. When the cell moves from a less to a greater degree of concentration, i.e. towards the focus of production, the chemiotaxis is termed positive; when the converse obtains, negative. This apparently purposive movement has been pointed out by M. Verworn to depend upon stimulation to contraction or the reverse. Metchnikoff showed that in animals immune to a given organism phagocytosis is present, whereas in susceptible animals it is deficient or absent. He also showed that the development of artificial immunity is attended by the appearance of phagocytosis; also, when an anti-serum is injected into an animal, the phagocytes which formerly were indifferent might move towards and destroy the bacteria. In the light of all the facts, however, especially those with regard to anti-bacterial sera, the presence of phagocytosis cannot be regarded as the essence of immunity, but rather the evidence of its existence. The increased ingestion of bacteria in active immunity would seem to depend upon the presence of immune opsonins in the serum. These, as already explained, are true anti-substances. Thus the apparent increased activity of the leucocytes is due to a preliminary effect of the opsonins on the bacteria. We have no distinct proof that there occurs in active immunity any education of the phagocytes, in Metchnikoff's sense, that is, any increase of the inherent digestive activity of these cells. There is some evidence that in certain cases anti-substances may act upon the leucocytes, and to these the name of "stimulins" has been given. We cannot, however, say that these play an important part in immunity, and even if it were so, the essential factor would be the development of the substances which act in this way. While in immunity there probably occurs no marked change in the leucocytes themselves, it must be admitted that the increased destruction of bacteria by these cells is of the highest importance.

This, as already pointed out, depends upon the increase of opsonins, though it is also to be noted that in many infective conditions, therefore, a factor is present, namely a leucocytosis, that is, an increase of the leucocytes in the blood, and the phagocytic powers of the body are thereby increased. Evidence has been brought forward within recent years that the leucocytes may constitute an important source of the antagonistic substances which appear in the serum. Much of such evidence possesses considerable weight, and seeing that these cells possess active digestive powers it is by no means improbable that substances with corresponding properties may be set free by them. To ascribe such powers to them exclusively is, however, not justifiable. Probably the lining endothelium of the blood-vessels as well as other tissues of the body participate in the production of anti-substances.

The subject of artificial immunity has occupied a large proportion of bacteriological literature within recent years, and our endeavour has been mainly to indicate the general laws which are in process of evolution. When the facts of natural immunity are examined, we find that no single explanation is possible. Natural immunity against toxins must be taken into account, and, if Ehrlich's view with regard to toxic action be correct, this may depend upon either the absence of chemical affinity of the living molecules of the tissues for the toxic molecule, or upon insensitiveness to the action of the toxophorous group. It has been shown with regard to the former, for example, that the nervous system of the fowl, which possesses immunity against tetanus toxin, has little combining affinity for it. The non-sensitiveness of a cell to a toxic body when brought into immediate relationship cannot, however, be explained further than by saying that the disintegrative changes which underlie symptoms of poisoning are not brought about. Then as regards natural powers of destroying bacteria, phagocytosis aided by chemiotaxis plays a part, and it can be understood that an animal whose phagocytes are attracted by a particular bacterium will have an advantage over one in which this action is absent. Variations in chemiotaxis towards different organisms probably depend in natural conditions, as well as in active immunization, on the opsonic content of the serum. Whether bacteria will be destroyed or not after they have been ingested by the leucocytes will depend upon the digestive powers of the latter, and these probably vary in different species of animals.

The blood serum has a direct bactericidal action on certain bacteria, as tested outside the body, and this also varies in different animals. Observations made on this property with respect to the anthrax bacillus at first gave the hope that it might explain variations in natural immunity. Thus the serum of the white rat, which is immune to anthrax, kills the bacillus; whereas the serum of the guinea-pig, which is susceptible, has no such effect. Further observations, however, showed that this does not hold as a general law. The serum of the susceptible rabbit, for example, is bactericidal to this organism, whilst the serum of the immune dog is not. In the case of the latter animal the serum...
contains an opsonin which leads to phagocytosis of the bacillus, and the latter is then destroyed by the leukocytes. It is quite evident that the bactericidal action as tested in vitro outside the body does not correspond to the degree of immunity possessed by the animal under natural conditions. We may say, however, that there are several factors concerned in natural immunity, of which the most important may be said to be the following: viz., variations in the bactericidal action of the serum in vitro, variations in the chemotactic or opsonic properties of the serum in vivo, and variations in the digestive properties of the leucocytes of the particular animal. It is thus evident that the explanation of natural immunity in any given instance may be a matter of difficulty and much complexity.

AUTHORITIES.—Bacteriological literature has become so extensive that it is impossible to give here references to original articles, every one of them being important. A number of these, giving an account of classical researches, were translated from French and German, and published by the New Sydenham Society under the title Micro-organisms and Diseases: Selected Essays, in 1886. The following list contains some of the more important books published within the last few years. Abbott, Principles of Bacteriology (7th ed., London, 1905); Crookshank, Bacteriology and Infective Diseases (with bibliography, 4th ed., London, 1896); Dulaeu, Traité de microbiologie (Paris, 1890); Dulaeu, Traité de Pathologie Microbienne (Philadelphia, 1899); Flügge, Die Mikroorganismen (3rd ed., Leipzig, 1896); Fischer, Vorlesungen über Bakterien (2nd ed., Jena, 1902); Günther, Einführung in das Studium der Bakteriologie (6th ed., Leipzig, 1896); Hamburger, Microorganismen (Anh., 1901); Huppe, Principes de Bacteriologie (translation, London, 1899); Klein, Micro-organisms and Disease (3rd ed., London, 1896); Kolle and Wassermann, Handbuch der pathogenen Mikroorganismen (Jena, 1904); supplements are still being published; this is the most important work on the subject); Löffler, Vorlesungen über die geschichtliche Entwicklung der Lehre von der Bacterien (Leipzig, 1887); McFarland, Text-book upon the Pathogenic Bacteria (5th ed., London, 1906); Muir and Ritchie, Manual of Bacteriology (with bibliography, 4th ed., Edinburgh, 1896); Park, Pathogenic Micro-organisms (London, 1896); Sternberg, Manual of Bacteriology (with full bibliography, 2nd ed., New York, 1896); Woodhead, Bacteria and their products (with bibliography, London, 1891). The personal knowledge of the infective diseases (with bibliography) is fully given in the System of Medicine, edited by Clifford Allbutt, (2nd ed., London, 1907). For references consult Centrblü. für Bakteri. u. Parasitenk. (Jena); also Index Medicus. The most important work on immunity are: Ehricke, Studien in Immunologie (English translation, New York, 1906), and Metchnikoff, Immunity in Infective Diseases (English translation, Cambridge, 1905). (R. M. *)

BACTRIA (Bacriana), the ancient name of the country between the range of the Hindu Kush (Paropamisus) and the Oxus (Amu Darya), with the capital Bactra (now Balkh); in the Persian inscriptions Bakhtri. It is a mountainous country with a moderate climate. Water is abundant and the land is very fertile. Bactria was the home of one of the Iranian tribes (see PERSIA: Ancient History). Modern authors have often used the name in a wider sense, as the designation of the whole eastern part of Iran. As there can be scarcely any doubt that it was in these regions, where the fertile soil of the mountainous country is everywhere surrounded and limited by the Turanian desert, that the prophet Zoroaster preached and gained his first adherents, and that his religion spread from Persia, it is manifest that the language in which the Avesta, the holy book of Zoroastrianism, is written, has often been called "old Bactrian." But there is no reason for this extensive use of the name, and the term "old Bactrian" is, therefore, at present completely abandoned by scholars. Still less foundation exists for the belief, once widely spread, that Bactria was the cradle of the Indo-European race; it was based on the supposition that the nations of Europe had immigrated from Asia, and that the Aryan languages (Indian and Iranian) stood nearest to the original language of the Indo-Europeans. It is now acknowledged by all linguists that this supposition is quite wrong, and that the Aryans probably came from Europe. The eastern part of Iran seems to have been the region where the Aryans lived as long as they formed one people, and whence they separated into Indians and Iranians.

The Iranian tradition, preserved in the Avesta and in Ferdousi's Shahnamâ, localizes a part of its heroes and myths in the east of Iran, and has transformed the old gods who fight with the great snake into kings of Iran who fight with the Turanians. Many modern authors have attempted to make history out of these stories, and have created an old Bactrian empire of great extent, the kings of which had won great victories over the Turanians; But this historical aspect of the myth is of late origin: it is nothing but a reflex of the great Iranian empire founded by the Achæmenids and restored by the Sassanids. The only historical fact which we can learn from the Iranian tradition is that the contrast and the feud between the peasants of Iran and the nomads of Turan was as great in old times as it is now: it is indeed based upon the natural geographical conditions, and is therefore eternal. But a great Bactrian empire certainly never existed; the Bactrians and their neighbours were in old times ruled by petty local kings, one of whom was Vishastpa, the protector of Zoroaster. Ctesias in his history of the Assyrian empire (Diodor. Sic. ii. 6 ff.) narrates a war waged by Ninus and Semiramis against the king of Bactria (whom some later authors, e.g. Justin i. 1, call Zoroaster). But the whole Assyrian history of Ctesias is nothing but a fantastic fiction; from the Assyrian inscriptions we know that the Assyrians never entered the eastern parts of Iran.

Whether Bactria formed part of the Median empire, we do not know; but it was subjugated by Cyrus and from then formed one of the satrapies of the Persian empire. When Alexander had defeated Darius III., his murderer Bessus, the satrap of Bactria, tried to organize a national resistance in the east. But Bactria was conquered by Alexander without much difficulty; it was only farther in the north, beyond the Oxus, in Sogdiana, that he met with strong resistance. Bactria became a province of the Macedonian empire, and soon came under the rule of Seleucus, king of Asia (see Seleucid Dynasty and Hellenism). The Macedonians (and especially Seleucus I. and his son Antiochus I.) founded a great many Greek towns in eastern Iran, and the Greek language became for some time dominant there. The many difficulties against which the Seleucid kings had to fight and the attacks of Ptolemy II., gave to Diodotus, satrap of Bactria, the opportunity of making himself independent (about 255 B.C.) and of conquering Sogdiana. He was the founder of the Graeco-Bactrian kingdom. Diodotus and his successors were able to maintain themselves against the attacks of the Seleucids; and when Antiochus III., "the Great," had been defeated by the Romans (190 B.C.), the Bactrian king Euthydemos and his son Demetrius crossed the Hindu Kush and began the conquest of eastern Iran and the Indus valley. For a short time they wielded great power; a great Greek empire seemed to have arisen far in the East. But this empire was torn by internal dissensions and continual usurpations. When Demetrius advanced far into India one of his generals, Eucretades, made himself king of Bactria, and soon in every province there arose new usurpers, who proclaimed themselves kings and fought one against the other. Most of them we know only by their coins, a great many of which are found in Afghanistan and India. By these wars the dominant position of the Greeks was undermined even more quickly than would otherwise have been the case. After Demetrius and his successors had been driven out of Sogdiana, the language of the whole empire fell again into use by the side of the Greek. On the coins struck in India, the well-known Indian alphabet (called Brahmi by the Indians, the older form of the Devanagari) is used; on the coins struck in Afghanistan and in the Punjab the Kharoshthi alphabet, which is derived directly from the Aramaic and was in common use in the western parts of India, as is shown by one of the inscriptions of Asoka and by the recent discovery of many fragments of Indian manuscripts, written in Kharoshthi, in eastern Turkestan (formerly this alphabet has been called Arianic or Bactrian Pali; the true name is derived from Indian sources).

The weakness of the Graeco-Bactrian kingdoms was shown by their sudden and complete overthrow. In the west the Arsacid empire had risen, and Mithradates I. and Phraates II. began to conquer some of their western districts, especially Aeria (Herat). But in the north a new race appeared, Mongolian tribes, called
BACUP—BADAJOS

181

One of the hills in the vicinity is fortified with a great ancient earthwork and ditch.

BADAGS (literally, "a Telugu man"), a tribe inhabiting the Nilgiri Hills, in India, by some authorities declared not to be an aboriginal or jungle race. They are probably Dravidian by descent, though they are in religion Hindus of the Saiva sect. They are supposed to have migrated to the Nilgiris from Mysore about A.D. 1600, after the breaking up of the kingdom of Vijayanagar. They are an agricultural people and far the most numerous and wealthy of the hill tribes. They pay a tribute in grain, &c., to the Todas. Their language is a corrupt form of Kanarese. At the census of 1901 they numbered 34,178.

BADAJOS (formerly sometimes written Badajos), a frontier province of western Spain, formed in 1833 of districts taken from the province of Estremadura (p.37), and bounded on the N. by Cáceres, E. by Cordova and Ciudad Real, S. by Seville and Huelva, and W. by Portugal. Pop. (1900) 520,246; area, 8,451 sq. m. Badajos is thus the largest province of the whole territory. Although in many districts there are low ranges of hills, the surface is mostly an extensive plain, flat or slightly undulating. Its one large river is the Guadiana, which traverses the north of the province from east to west, fed by many tributaries; but it is only at certain seasons that the river-beds fill with any considerable volume of water, and the Guadiana may frequently be forded without difficulty. The climate shows great extremes of heat in summer and of cold in winter, when fierce north and north-west winds blow across the plains. In the hot months intermittent fevers are prevalent in the Guadiana valley. The rainfall is scanty in average years, and only an insignificant proportion of the land is irrigated, while the rest is devoted to pasture, or covered with thin bush and forest.

Agriculture, and the cultivation of fruit, including the vine and olive, are thus in a very backward condition; but Badajos possesses more livestock than any other Spanish province. Its acorn-fed swine are celebrated throughout Spain for their hams and bacon, and large herds of sheep and goats thrive where the pasture is too meagre for cattle. The exploitation of the mineral resources of Badajos is greatly hindered by lack of communications, and only 60,000 tons of coal were mined in 1903, although the total amount registered only 26,000 tons. Their output consisted of lead, with very small quantities of copper. The local industries are not of much importance: they comprise manufacturers of woolen and cotton stuffs of a coarse description, soaps, oils, cork and leather. The purely commercial interests are more important than the industrial, because of the transit trade to and from Portugal through no less than seven custom-houses. Many parts of the province are inaccessible except by road, and the roads are ill-made, ill-kept and wholly insufficient.

The main line of the Madrid-Lisbon railway passes through Villanueva de la Serena, Mérida, and Badajos; at Mérida it is joined by the railways going north to Cáceres and south to Zafra, where the lines from Huelva and Seville unite. After Badajos, the capital (pop. (1900) 30,000), the principal towns are Almen-}

BACUP, a market town and municipal borough in the Rossendale parliamentary division of Lancashire, England, on the river Irwell, 203 m. N. N.W. from London, and 22 m. by E. from Manchester, on the Lancashire & Yorkshire railway. Pop. (1901) 22,591. It is a market town, surrounded by wild, high-lying moorland. It is wholly of modern growth, and contains several handsome churches and other buildings, while among institutions the chief is the mechanics' institute and library. The recreation grounds presented in 1893 by Mr. J. H. Marden, M.P., are beautifully laid out. Cotton spinning and power-loom weaving are the chief of numerous manufacturing industries, and there are large collieries in the vicinity. The principle of co-operation is strongly developed, and a large and handsome store contains among other departments a free library for members. The borough was incorporated in 1882, and the corporation consists of a mayor, 6 aldermen and 17 councillors. Area, 6120 acres. In 1841 the population of the chapelry was only 1526.
BADAKSHAN

bank of the river Guadiana, and the Madrid-Lisbon railway. Pop. (1900) 30,899. Badajoz is the see of a bishop, and the official residence of the captain-general of Estremadura. It occupies a slight eminence, crowned by the ruins of a Moorish castle, and overlooking the Guadiana. A strong wall and bastions, with a broad moat and outworks, and forts on the surrounding heights, give the city an appearance of great strength. The river, which flows between the castle-hill and the powerfully armed fort of San Cristóbal, is crossed by a magnificent granite bridge, originally built in 1460, repaired in 1597 and rebuilt in 1833. The whole aspect of Badajoz recalls its stormy history; even the cathedral, built in 1288, resembles a fortress, with massive embattled walls. Badajoz was the birthplace of the statesman Manuel de Godoy, duke of Alcudia (1726-1812), and of the painter Luís de Morales (1700-1833). Two pictures by Morales, unfortunately retouched in modern times, are preserved in the cathedral. According to its position the city enjoys a considerable transit trade with Portugal; its other industries include the manufacture of linen, woollen and leather goods, and of pottery. It is not mentioned by any Roman historian, and first rose to importance under Moorish rule. In 1031 it became the capital of a small Moorish kingdom, and, though temporarily held by the Portuguese in 1168, it retained its independence until 1229, when it was captured by Alphonso IX. of Leon. As a frontier fortress it underwent many sieges. It was beleaguered by the Portuguese in 1660, and in 1705 by the Allies in the War of the Spanish Succession. During the Peninsular War Badajoz was unsuccessfully attacked by the French in 1808 and 1809; but on the 10th of March 1811, the Spanish commander, José Imaz, was bribed into surrendering to the French force under Marshal Soult. A British army, commanded by Marshal Beresford, endeavoured to retake it, and on the 16th of May defeated a relieving force at Albuera, but the siege was abandoned in June. The fortress was finally stormed on the 6th of April 1812, by the French under Soult and carried with terrible loss. It was then delivered up to a two-day's spoilage. A military and republican rising took place here in August 1883, but completely failed.

BADAKSHAN, including Wakhān, a province on the north-east frontier of Afghanistan, adjoining Russian territory. Its north-eastern boundaries were decided by the Anglo-Russian agreement of 1873, which expressly acknowledged "Badakshān with its dependent district Wakhān" as "fully belonging to the amīr of Kabūl," and limited it to the left or southern bank of the Oxus. Much of the interior of the province is still unexplored. On the west, Badakshān is bounded by a line which crosses the Turkestān plains southwards from the junction of the Kunduz and Oxus rivers till it touches the eastern water divide of the Tashkurgan river (here called the Koh-i-Chungar), and then runs south-east, crossing the Sārhkāb affluent of the Khanābād (Kunduz), till it strikes the Hindū Kush. The boundary is carried along the crest of the Hindū Kush as far as the Khawāk pass, leading from Badakshān into the Panjshir valley. Beyond this it is indefinite. It is known that the Kafirs occupy the crest of the Hindū Kush eastwards of the Khawāk, but how far they extend north of the main watershed is not ascertainable. The southern limits of Badakshān become definite again at the Dorah pass. The Dorah connects Zebak and Ishkāshīm at the elbow, or bend, of the Oxus with the Lutku valley leading to Chītrāl. From the Dorah eastwards the crest of the Hindū Kush again becomes the boundary till it effects a junction with the Muztagh and Sarikol ranges, which shut off China from Russia and India. Skirting round the head of the Tagdumbāsh Pamir, it finally merges into the Pamir boundary, and turns north-eastwards, following the course of the Oxus, to the junction of that river and the Khanābād (Kunduz). So far as the northern boundary follows the Oxus stream, under the northern slopes of the Hindū Kush, it is only separated by the length of these slopes (some 8 or 10 m.) from the southern boundary along the crest. Thus Badakshān reaches out an arm into the Pamirs eastwards—bottle-shaped—narrow at the neck (represented by the northern slopes of the Hindū Kush), and

swelling out eastwards so as to include a part of the great and little Pamirs. Before the boundary settlement of 1873 the small states of Roshan and Shīgān extended to the left bank of the Oxus, and the province of Darwaz, on the other hand, extended to the right bank. Now, however, the Darwaz extension northwards is exchanged for the Russian Pamir extension eastwards, and the river throughout is the boundary between Russian and Afghan territory; the political boundaries of those provinces and those of Wakhān being no longer coincident with their geographical limits.

The following are the chief provincial subdivisions of Badakshān, omitting Roshan and Shīgān:—On the west Rustak, Kataghan, Ghori, Nārin and Anderāb; on the north Darwaz, Ragh and Shīwa; on the east Charān, Ishkāshīm, Zebak and Wakhān; and in the centre Faizābād, Farkhār, Minjān and Khishān. There are others, but nothing certain is known about these minor subdivisions.

The climate is very variable, the mountainous districts, which comprise all the southern districts of Badakshān and the northern hills and valleys of Kafirstan, is undoubtedly analogous to that of the rest of the Hindū Kush westwards. The water-divide of the Hindū Kush from the Dorah to the Khawāk pass, i.e. through the centre of Kafirstan, has never been accurately traced; but its topographical conformation is evidently a continuation of that which has been observed in the districts of Badakshān to the west of the Khawāk. The Hindū Kush represents the southern edge of a great central upheaval or plateau. It breaks up into long spurs southwards, deep amongst which are hidden the valleys of Kafirstan, almost isolated from each other by the rugged and snow-capped altitudes which divide them. To the north the plateau gradually slopes away towards the Oxus, falling from an average altitude of 15,000 ft. to 4000 ft. about Faizābād, in the centre of Badakshān, but tailing off to 1100 ft. at Kunduz, in Kataghan, where it merges into the flat plains bordering the Oxus.

The Kokha river traverses Badakshān from south-east to north-west, and, with the Kunduz, drains all the northern slopes of the Hindū Kush west of the Dorah pass. Some of its sources are near Zebak, close to the great bend of the Oxus northwards, so that it cuts off all the mountainous area included within that bend from the rest of Badakshān. Its chief affluent is the Minjān, which Sir George Robertson found to be a considerable stream where it approaches the Hindū Kush close under the Dorah. Like the Kunduz, it probably drains the northern slopes of the Hindū Kush by deep lateral valleys, more or less parallel to the crest, reaching westwards towards the Khawāk pass. From the Oxus (1000 ft.) to Faizābād (4000 ft.) and Zebak (8500 ft.) the course of the Kokha offers a high road across Badakshān; between Zebak and Ishkāshīm, at the Oxus bend, there is but an insignificant pass of 9500 ft.; and from Ishkāshīm by the Tashkurgan through the Pamir, is the continuation of what must once have been a much-traversed trade route connecting Afghan Turkestān with Kashgar and China. It is undoubtedly one of the great continental high-roads of Asia. North of the Kokha, within the Oxus bend, is the mountainous district of Darwaz, of which the physiography belongs rather to the Pamir type than to that of the Hindū Kush.

A very remarkable meridional range extends for 100 m. northwards from the Hindū Kush (it is across this range that the route from Zebak to Ishkāshīm lies), which determines the great bend of the Oxus river northwards from Ishkāshīm, and narrows the valley of that river into the formation of a trough as far as the next bend westwards at Kala Wamar. The western slopes of this range drain to the Oxus either north-westwards, by the Kokha and the Ragh, or else they twist their streams into the Shīwa, which runs due north across Darwaz. Here again we find the main routes which traverse the country following the rivers closely. The valleys are narrow, but fertile and populous. The mountains are rugged and difficult; but there is much of the world-famous beauty of scenery, and of the almost phenomenal agricultural wealth of the valleys of Bokhara and Ferghana to be found in the as yet half-explored recesses of Badakshān.
BADALCHIO—BADEN

The principal domesticated animal is the yak. There are also large flocks of sheep, cows, goats, ponies, fine dogs and Bactrian camels. The more important wild animals are a large wild sheep (Ovis poli), foxes, wolves, jackals, bears, boars, deer and leopards; amongst birds, there are partridges, pheasants, ravens, jays, sparrows, larks, a famous breed of hawks, &c.

Badakshan proper is peopled by Tajiks, Turks and Arabs, who speak the Persian and Turkic languages, and profess the orthodox doctrines of the Mahomedan law adopted by the Sunnite sect; while the mountainous districts are inhabited by Tajiks, professing the Shi'ite creed and speaking distinct dialects in different districts.

History.—Badakshan, part of the Greek Bactria, was visited by Hsiian Tsan in 630 and 644. The Arabian geographers of the 10th century speak of its mines of ruby and lapis lazuli, and give notices of the flourishing commerce and large towns of Waksh and Khott, regions which appear to have in part corresponded with Badakshan. In 1272-1273 Marco Polo and his companions stayed for a time in Badakshan. During this and the following centuries the country was governed by kings who claimed to be descendants of Alexander the Great. The last of these kings, Shah Mahommed, who died in the middle of the 15th century, leaving only his married daughters to represent the royal line. Early in the middle of the 16th century the Usbegs obtained possession of Badakshan, but were soon expelled, and then the country was generally governed by descendants of the old royal dynasty by the female line. About the middle of the 18th century the present dynasty of Mirs established its footing in the place of the old one which had become extinct. In 1765 the country was invaded and ravaged by the ruler of Kabul. During the first three decades of the 19th century it was overrun and depopulated by Kohan Beg and his son Murad Beg, chiefs of the Kataghan Usbegs of Kunduz. When Murad Beg died, the power passed into the hands of another Usbeg, Mahommed Amir Khan. In 1859 the Kataghan Usbegs were expelled; and Mir Jahander Shah, the representative of the modern royal line, was reinstated at Faizabad under the supremacy of the Afghans. In 1867 he was expelled by Abdur Rahman and replaced by Mir Mahommed Shah, and other representatives of the same family.

(B. H. H.)

BADALCCHIO, SISTO, surnamed Rosa (1581-1647), Italian painter and engraver, was born at Parma. He was of the school of Annibale Carracci, by whom he was highly esteemed for design. His principal engravings are the series known as Raphael's Bible, which were executed by him in conjunction with Lanfranco, another pupil of Carracci. The best of his paintings, which are few in number, are at Parma. He died at Bologna.

BADALONA (anc. Boetule), a town of north-eastern Spain, in the province of Barcelona; 6 m. N.E. of the city of Barcelona, on the left bank of the small river Besòs, and on the Mediterranean Sea. Pop. (1900) 10,240. Badalona has a station on the coast railway from Barcelona to Perpignan in France, and a small harbour, chiefly important for its fishing and boat-building trades. There are gas, chemical and mineral-oil works in the town, which also manufactures woollen and cotton goods, glass, biscuits, sugar and brandy; while the surrounding fertile plains produce wines, almonds, olives and rice. Badalona thus largely contributes to the export trade of Barcelona, and may, in fact, be regarded as its industrial suburb.

BADDY, JOHN (d. 1410), one of the early Lollard martyrs, was a tailor (or perhaps a blacksmith) in the west Midlands, and was condemned by the Worcester diocesan court for his denial of transubstantiation. Baddy bluntly maintained that when Christ sat at supper with his disciples he had not his body in his hand to distribute, and that "if every host consecrated at the altar were the Lord's body, then there be 20,000 Gods in England." A further court in St Paul's, London, presided over by Archbishop Arundel, condemned him to be burned at Smithfield, the tournament ground just outside the city walls. It is said that the prince of Wales (afterwards Henry V.) witnessed the execution and offered the sufferer both life and a pension if he would recant; but in Walsingham's words, "the abandoned villain declined the prince's advice, and chose rather to be burned than to give reverence to the life-giving sacrament. So it befell that this mischievous fellow was burnt to ashes, and died miserably in his sin."

BADDELEY, ROBERT (c. 1732-1794), English actor, is said to have been first a cook to Samuel Foote, "the English Aristophanes," and then a valet, before he appeared on the stage. In 1761, described as "of Drury Lane theatre," he was seen at the theatre in Smock Alley, Dublin, as Gomez in Dryden's Spanish Friar. Two years later he was a regular member of the Drury Lane company in London, where he had a great success in the low comedy and servants' parts. He remained at this theatre and the Haymarket until his death. He was the original Moses in the School for Scandal. Baddeley died on the 20th of November 1794. He bequeathed property to found a home for decayed actors, and also £3 per annum to provide wine and cake in the green-room of Drury Lane theatre on Twelfth Night. The ceremony of the Baddeley cake has remained a regular institution.

His wife SOPHIA BADDELEY (1745-1786), an actress and singer, was born in London, the daughter of a sergeant-trumpeter of the Usbegs. She was a woman of great beauty, but excessive vanity and notorious conduct. At the age of sixteen she ran away with Baddeley, then acting at Drury Lane, and she herself made her first appearance on the stage there on the 27th of April 1765, as Ophelia. Later, as a singer, she obtained engagements at Ranelagh and Vauxhall. Though separated from her husband on account of her misconduct, she still played several years in the same company. Her beauty and her extravagance rendered her celebrated, but the money which she made in all sorts of ways was so freely squandered that she was obliged to take refuge from her creditors in Edinburgh, where she made her last appearance on the stage in 1784.

See Memoirs of Mistress Sophia Baddeley, by Mrs Elizabeth Steele, 6 vols. (1781).

BADEN, a town and watering-place of Austria, in lower Austria, 17 m. S. of Vienna by rail. Pop. (1900) 12,447. It is beautifully situated at the mouth of the romantic Helenenthal, on the banks of the Schwechat, and has become the principal watering-place of the inhabitants of the neighbouring capital. It possesses a new Kurhaus, fifteen bathing-establishments, a parish church in late Gothic style, and a town-hall, which contains interesting archives. The warm baths, which gave name to the town, are thirteen in number, with a temperature of from 72° F. to 97° F., and contain, as chief ingredient, sulphate of lime. They rise for the most part at the foot of the Calvarienberg (1070 ft.), which is composed of dolomitic limestone, and are mostly used for bathing purposes. Several members of the Austrian imperial family have made Baden their summer residence and have built here beautiful villas. There are about 20,000 visitors annually. Baden possesses several parks and is surrounded by lovely and interesting spots, of which the most frequented is the picturesque valley of the Helenenthal, which is traversed by the Schwechat. Not far from Baden, the valley is crossed by the magnificent aqueduct of the Vienna waterworks. At the entrance to the valley, on the right bank of the river, in the ruins of the 12th-century castle of Rauhenbeck, and at its foot stands the Château-Weilburg, built in 1260-1275 by Archduke Charles, the victor of Aspern. On the left bank, just opposite, stands the ruined castle of Rauhenstein, dating also from the 12th century. About 4 m. up the valley is Mayerling, a hunting-lodge, where the crown prince Rudolph of Austria was found dead in 1889. Farther up is Alland, whence a road leads to the old and well-preserved abbey of Heiligkreuz. It possesses a church, in Romanesque style, dating from the 11th century, with fine cloisters and the tombs of several members of the Babenberg family. The highest point in the neighbourhood of Baden is the peak of the Hoher Lindkogel (2825 ft.), popularly called the Eisener Thor, which is ascended in about three hours.

The celebrity of Baden dates back to the days of the Romans, who knew it by the name of Thermes Pannonicae, and remains of their occupation still exist. It received its charter as a town
in 1480, and although sacked at various times by Hungarians and Turks, it soon flourished again.

BADEN, or BADEN-BADEN (to distinguish it from other places of the name), a town and fashionable watering-place of Germany, in the grand-duchy of Baden, 23 m. S. by W. of Karlsruhe, with which it is connected by a branch of the Mannheim and Basel railway. Its situation—on a hill 600 ft. high, in the beautiful valley of the Black Forest—its extensive pleasure-grounds, gardens and promenades, and the brilliancy of the life that is led during the season, have long attracted crowds of visitors from all parts of the world. The resident population was in 1885, 12,770; in 1895, 14,862; and in 1905, 16,238; but the number of visitors exceeds 70,000 annually. Until the war of 1870, the prevailing nationality was French, but of late years Americans, Russians and English are the more numerous. The hot springs are twenty-nine in number, and vary in temperature from 37° to 54° R., *i.e.* from 115° to 153° Fahr. They flow from the castle rock at the rate of 90 gallons per minute, and the water is conveyed through the town in pipes to supply the different baths. There are two large bathing establishments, accounted the most elegant in Europe. The waters of Baden-Baden are specific in cases of chronic rheumatism and gout, paralysis, neuralgia, skin diseases and various internal complaints, such as stone and uric acid. The town proper is on the right bank of the Oos, but the principal resorts of the visitors are on the left. A *Conversationshaus* and a *Trinkhalle* or pump-room, a theatre and a picture-gallery, library and reading-room are among the chief buildings. The public gaming-tables, which for so many years were a striking feature, are now abolished. The only building of much antiquarian interest, with the exception of the castles, is the parish church, which dates from the 15th century, and contains the tombs of several of the margraves. The churches include a Lutheran, an English, in the Norman style of architecture, and a Russian, with beautiful frescoes; while on the Michaelsberg is the Greek chapel, with a gilded dome, which was erected over the tomb of a son of the Rumanian prince Michel Stourdza, who died here in 1865.

The springs of Baden were known to the Romans, and the foundations of the town is referred to by Emperor Hadrian by 143 A.D. receive somewhat doubtful authenticity. The name of *Aurilia Aquensis* was given to it in honour of Aurelius Severus, in whose reign it would seem to have been well known. Fragments of its ancient sculptures are still to be seen, and in 1847 remains of Roman vapour baths, well preserved, were discovered just below the New Castle. From the 14th century down to the close of the 17th, Baden was the residence of the margraves, to whom it gave its name. They first dwelt in the Old Castle, the ruins of which still occupy the summit of a hill above the town, but in 1479 they removed to the New Castle, which is situated on the hill-side nearer to the town, and is remarkable for its subterranean dungeons. During the Thirty Years’ War Baden suffered severely from the various combats, but especially from the French, who pillaged it in 1643; and laid it in ashes in 1689. The margrave Louis William removed to Rastatt in 1706. Since the beginning of the 15th century the government has greatly fostered the growth of the town.

BADEN, a town in the Swiss canton of Aargau, on the left bank of the river Limmat, 14 m. by rail N.W. of Zürich. It is now chiefly visited by reason of its hot sulphur springs, which are mentioned by Tacitus (Hist., i. cap. 67) and were very fashionable in the 15th and 16th centuries. They are especially efficacious in cases of gouty and rheumatic affections, and are much frequented by Swiss invalids, foreign visitors being but few in number. They lie a little north of the old town, with which they are now connected by a fine boulevard. Many Roman remains have been found in the gardens of the Kursaal. The town is very picturesque, with its steep and narrow streets, and its one surviving gateway, while it is dominated on the west by the ruined castle of Stein, formerly a stronghold of the Habsburgs, but destroyed in 1415 and again in 1712. In 1415 Baden (with the Aargau) was conquered by the Eight Swiss Confederates, whose bailiff inhabited the other castle, on the right bank of the Limmat, which defends the ancient bridge across that river. As the conquest of the Aargau was the first made by the Confederates, their delegates (or the federal diet) naturally met at Baden, from 1426 to about 1712, to settle matters relating to these subject lands, so that during that period Baden was really the capital of Switzerland. The diet sat in the old town-hall or *Rathaus*, where was also signed in 1714 the treaty of Baden which put an end to the war between France and the Empire, and thus completed the treaty of Utrecht (1713). Baden was the capital of the canton of Baden, from 1708 to 1803, when the canton of Aargau was created. To the N.W. of the baths a new industrial quarter has sprung up of late years, the largest works being for electric engineering. In 1900 the permanent population of Baden was 6050 (German-speaking, mainly Romanists, with many Jews), but it is greatly swelled in summer by the influx of visitors.

One mile S. of Baden, on the Limmat, is the famous Cistercian monastery of Wettingen (1227–1841—the monks are now at Mas; the name is Bregenz), with splendid old painted glass in the cloisters and magnificent early 17th-century carved stalls in the choir of the church. Six miles W. of Baden is the small town of Brugg (3435 inhabitants) in a fine position on the Aar, and close to the remains of the Roman colony of *Windonna* (Windisch), as well as to the monastery (founded 1316) of Königsfelden, formerly the burial-place of the early Habsburgs (the castle of Habsburg is but a short way off), still retaining much fine painted glass.

BADEN, GRAND DUCHY OF, a sovereign state of Germany, lying in the south-west corner of the empire, bounded N. by the kingdom of Bavaria and the grand-duchy of Hesse-Darmstadt; W. and practically throughout its whole length by the Rhine, which separates it from the Bavarian Palatinate and the imperial province of Alsace-Lorraine; S. by Switzerland, and E. by the kingdom of Württemberg and part of Bavaria. The country has an area of 5823 sq. m. and consists of a considerable portion of the eastern half of the fertile valley of the Rhine and of the adjacent uplands. The principal town is Baden-Baden, by far the most extensive, forming, indeed, nearly 80% of the whole area. From the Lake of Constance in the south to the river Neckar in the north is a portion of the Black Forest or *Schwarzwald*, which is divided by the valley of the Kinzig into two districts of different elevation. To the south of the Kinzig the mean height is 3100 ft., and the loftiest summit, the Feldberg, reaches about 4808 ft., while to the north the mean height is only 2100 ft., and the Belchen, the culminating point of the whole, does not exceed 4480 ft. To the north of the Neckar is the Odenwald Range, with a mean of 1440 ft., and in the Katzenbuckel, an extreme of 1980 ft. Lying between the Rhine and the Dreisam is the Kaiserstuhl, an independent volcanic group, nearly 10 m. in length and 5 m. in breadth, the highest point of which is 1760 ft. The greater part of Baden belongs to the basin of the Rhine, which receives upwards of twenty tributaries from the highlands; the north-eastern portion of the territory is also watered by the Main and the Neckar. A part, however, of the eastern slope of the Black Forest belongs to the basin of the Danube, which then takes its rise in a number of mountain streams. Among the numerous lakes which belong to the duchy are the Mummel, Wilder, Eichener and Schluch, but none of them is of any size. The Lake of Constance (*Boden-See*) belongs partly to Bavaria and Switzerland.

Owing to its physical configuration Baden presents great extremes of heat and cold. The Rhine valley is the warmest district in Germany, but the higher elevations of the Black Forest record the greatest degrees of cold experienced in the south. The mean temperature of the Rhine valley is approximately 50° F. and that of the high table-land, 43° F. July is the hottest and January the coldest month in the year.
The mineral wealth of Baden is not great; but iron, coal, zinc and lead of excellent quality are produced, and silver, copper, gold, cobalt, vitriol and sulphur are obtained in small quantities. Pect is found in abundance, as well as gypsum, china-clay, potters' earth and salt. The mineral springs of Baden are very numerous and have acquired great celebrity, those of Baden-Baden, Badenweiler, Antogast, Grisbach, Freiersbach and Petersthal being the most frequented.

In the valleys the soil is particularly fertile, yielding luxuriant crops of wheat, maize, barley, spelt, beans, potatoes, flax, hemp, hops, beetroot and tobacco; and even in the more mountainous parts rye, wheat and oats are extensively cultivated. There is a considerable extent of pasture land, and the rearing of cattle, sheep, pigs and goats is largely practised. Of game, deer, wild boar, hares, snipe and partridges are fairly abundant, while the mountain streams yield trout of excellent quality. The culture of the vine increases, and the wines, which are characterized by a mildness of flavour, are in good demand. The gardens and orchards supply great abundance of fruits, especially almonds and walnuts; and bee-keeping is common throughout the country. A greater proportion of Baden than of any other of the south German states is occupied by forests. In these the predominant trees are the fir and pine, but many others, such as the chestnut, are well represented. A third, at least, of the annual supply of timber is exported.

Population.—At the beginning of the 19th century Baden was only a margravate, with an area little exceeding 1300 sq. m., and a population of 210,000. Since then it has from time to time acquired additional territory, so that its area now amounts to 5823 sq. m., and its population (1905) to 2,009,320, of whom about 60% are Roman Catholics, 17% Protestants, 13% Jews, and the remainder of other confessions. Of the population, about one-half may be classified as rural, i.e., living in communities of less than 2000 inhabitants; while the density of the population is about 330 to the square mile. The country is divided into the following districts, with the respective chief towns and populations as shown:

<table>
<thead>
<tr>
<th>District</th>
<th>Chief towns</th>
<th>Pop. (1905)</th>

</tbody>
</table>

The capital of the duchy is Karlsruhe, and among important towns other than the above are Rastatt, Baden-Baden, Bruchsal and Lahr. The population is most thickly clustered in the north and in the neighbourhood of the Swiss town of Basel. The inhabitants of Baden are of various origin—those to the north of the Murg being descended from the Alemanni and those to the south from the Franks, while the Swabian plateau derives its name and its population from another race. (See WÜRTTEMBERG.)

Industries.—Of the area, 56.8% is cultivated and 32% forest, but the agricultural industry, which formerly yielded the bulk of the wealth of the country, is now equalled, if not surpassed, by the industrial output, which has attained very considerable dimensions. The chief articles of manufacture are machinery, woollen and cotton goods, silk ribbons, paper, tobacco, leather, china, glass, clocks, jewellery and chemicals. Beet sugar is also largely manufactured, and the inhabitants of the Black Forest have long been celebrated for their dexterity in the manufacture of wooden ornaments and toys, musical boxes and organs.

The exports of Baden, which coincide largely with the industries just mentioned, are of considerable importance, but the bulk of its trade consists in the transit of goods. The country is well furnished with roads and railways, the greater proportion of the latter being in the hands of the state. A line runs the whole length of the land, for the most part parallel with the Rhine, while branches cross obliquely from east to west. Mannheim is the great emporium for the export of goods down the Rhine and has a large river traffic. It is also the chief manufactoring town of the duchy and the seat of administrative government for the northern portion of the country.

Education and Religion.—The educational establishments of Baden are numerous and flourishing, and public education is entirely in the hands of the government. There are two universities, the Protestant at Heidelberg and the Roman Catholic at Freiburg-im-Breisgau, and a celebrated technical college at Karlsruhe. The grand-duke is a Protestant; under him the Evangelical Church is governed by a nominated council and a synod consisting of the "prelate," 48 elected, and 7 nominated lay and clerical members. The Roman Catholic archbishop of Freiburg is metropolitan of the Upper Rhine.

Constitution and Government.—The government of Baden is an hereditary monarchy, with the executive power vested in the grand-duke, while the legislative authority is shared by him with a representative assembly (Landtag) consisting of two chambers. The upper chamber is composed of all the princes of the reigning family who are of full age; the chiefs of the mediatized families; the archbishop of Freiburg; the president of the Protestant Evangelical church; a deputy from each of the universities and from the technical high school, eight members elected by the territorial nobility for four years, three representatives of the chamber of commerce, two of that of agriculture, one of that of trades, two mayors of municipalities, one burgomaster of lesser towns, one member of a district council, and eight members (15 of them legal functionaries) nominated by the grand-duke. The lower chamber consists of 73 popular representatives, of whom 24 are elected by the burghers of certain towns and 49 by the rural communities. Every citizen of 25 years of age, who has not been convicted and is not a pauper, has a vote. The elections are, however, indirect; the citizens nominating the Wahlmänner (deputy electors) and the latter electing the representatives. The chambers meet at least every two years. The members of the lower chamber are elected for four years, half the number retiring at the expiration of every two years. The executive consists of four departments of state—those of the interior, of foreign affairs and of the grand-ducal house, of finance, and of justice, ecclesiastical affairs and education. The chief sources of revenue are direct and indirect taxes, domains and railways. The supreme courts of justice of the duchy are in Karlsruhe, Freiburg, Offenburg, Heidelberg, Mosbach, Waldshut, Constance and Mannheim, whence appeals lie to the Reichsgericht (supreme tribunal of the empire) in Leipzig. By virtue of a convention with Prussia, of 1871, the Baden army forms a portion of the Prussian army.

History.—During the middle ages the district which now forms the grand-duchy of Baden was ruled by various counts, prominent among whom were the counts and dukes of Zähringen. In 1112 Hermann, a son of Hermann, margrave of Verona (d. 1074), and grandson of Bertold, duke of Carinthia and count of Zähringen, having inherited some of the German estates of his family, called himself margrave of Baden, and from this date the separate history of Baden may be said to begin. Hermann appears to have called himself by the title of margrave, and not the more usual title of count, owing to the connexion of his family with the margravate of Verona. His son and grandson, both named Hermann, added to their territories, which about 1200 were divided, and the lines of Baden-Baden and Baden-Hochberg were founded, the latter of which was divided about a century later into the branches of Baden-Hochberg and Baden-Sausenberg. The family of Baden-Baden was very successful in increasing the area of its possessions, which after several divisions were united by the margrave Bernard I. in 1391. Bernard, a soldier of some renown, continued the work of his predecessors, and obtained other districts, including Baden-Hochberg, the ruling family of which died out in 1418.

During the 15th century a war with the count palatine of the Rhine deprived Margrave Charles I. (d. 1475) of a part of his territories, but these losses were more than repaired by his son and successor, Christopher I. In 1503 the family of Baden-
Baden

Sausesenberg became extinct, and the whole of Baden was united by Christopher, who divided it, however, before his death in 1527 among his three sons. One of these died childless in 1533, and in 1535 his remaining sons, Bernard and Ernest, having shared their brother's territories, made a fresh division and founded the lines of Baden-Baden and Baden-Pforzheim, called after 1565 Baden-Durlach. Further divisions followed, and the weakness caused by these partitions was accentuated by a rivalry, between the two main branches of the family. This culminated in open warfare, and from 1584 to 1622 Baden-Baden was in the possession of one of the princes of Baden-Durlach. Religious differences added to this rivalry. During the period of the Reformation some of the rulers of Baden adhered to the older and some adopted the newer faith, and the house was similarly divided during the Thirty Years' War. Baden suffered severely during this struggle, and both branches of the family were exiled in turn. The treaty of Westphalia in 1648 restored the status quo, and the family rivalry gradually died out. During the wars of the reign of Louis XIV. the margravate was ravaged by the French troops, and the margrave of Baden-Baden, Louis William (d. 1707), was prominent among the soldiers who resisted the aggressions of France. In 1771 Augustus George of Baden-Baden died without sons, and his territories passed to Charles Frederick of Baden-Durlach, who thus became ruler of the whole of Baden.

Although in 1771 Baden was united under a single ruler it did not form a compact territory, and its total area was only about 13,500 sq. m. Consisting of a number of isolated districts lying on either bank of the upper Rhine, it was the work of Charles Frederick to acquire the intervening stretches of land, and so to give territorial unity to his country. Beginning to reign in 1738 and coming of age in 1746, this prince is the most notable of the rulers of Baden. He was interested in the development of agriculture and commerce; sought to improve education and the administration of justice, and was in general a wise and liberal ruler. His opportunity for territorial aggrandizement came during the Napoleonic wars. When war broke out between France and Austria in 1792 the Badenese fought for Austria; consequently their country was devastated and in 1796 the margrave was compelled to pay an indemnity, and to cede his territories on the left bank of the Rhine to France. Fortunately, however, soon returned to his side. In 1803, largely owing to the good offices of Alexander I., emperor of Russia, he received the bishopric of Constance, part of the Rhenish Palatinate, and other smaller districts, together with the dignity of a prince elector.

Changing sides in 1805 he fought for Napoleon, with the result that by the peace of Pressburg in that year he obtained the British and Spanish territories at the expense of the Habsburgs. In 1806 he joined the Confederation of the Rhine, declared himself a sovereign prince, became a grand-duke, and received other additions of territory. The Baden contingent continued to assist France, and by the peace of Vienna in 1809 the grand-duke was rewarded with accessions of territory at the expense of the kingdom of Würtemberg. Having quadrupled the area of Baden, Charles Frederick died in June 1811, and was succeeded by his grandson, Charles, who was married to Stephanie de Beauharnais (d. 1860), an adopted daughter of Napoleon. Charles fought for his father-in-law until after the battle of Leipzig in 1813, when he joined the Allies.

In 1815 Baden became a member of the Germanic confederation established by the Act of the 8th of June, annexed to the Final Act of the congress of Vienna of the 9th of June. In the hurly-burly of events which followed, the question of the succession to the grand-duchy had not been settled. This was soon to become acute. By the treaty of the 16th of April 1816, by which the territorial disputes between Austria and Bavaria were settled, the succession to the Baden Palatinate was guarantied to Maximilian I., king of Bavaria, in the expected event of the extinction of the line of Zähringen. As a counterblow to this the grand-duke Charles issued in 1817 a pragmatic sanction (Hausgesetze) declaring the counts of Hochberg, the issue of a morganatic marriage between the grand-duke Charles Frederick and Luise Geyer von Geyersberg (created Countess Hochberg), capable of succeeding to the crown. A controversy between Bavaria and Baden resulted, which was only decided in favour of the Hochberg claims by the treaty signed by the four great powers and Baden at Frankfort on the 10th of July 1819. Meanwhile the dispute had produced important effects in Baden. In order to secure popular support for the Hochberg heir, Charles in 1818 granted to the grand-duchy, under article xiii. of the Act of Confederation, a liberal constitution, under which two chambers were constituted and their assent declared necessary for legislation and taxation. The outcome was of importance far beyond the narrow limits of the duchy; for all Germany watched the constitutional experiments of the southern states. In Baden the conditions were not favourable to success. The people, belonging to the "Celtic fringe" of Germany, had fallen during the revolutionary period completely under the influence of French ideas, and this was sufficiently illustrated by the temper of the new chambers, which tended to model their activity on the proceedings of the Convention in the earlier days of the French Revolution. On the other hand, the new grand-duke Louis, who had succeeded in 1818, was unpopular, and the administration was in the hands of hide-bound and inefficient bureaucrats. The result was a deadlock; and, even before the promulgation of the Carlsbad decrees in October 1819 the grand-duke had prorogued the chambers, after three months of sterile debate. The reaction that followed was as severe in Baden as elsewhere in Germany, and culminated in 1823, when, on the refusal of the chambers to vote the military budget, the grand-duke dissolved them and levied the taxes on his own authority. In January 1825, owing to official pressure, only three Liberals were returned to the chamber; a law was passed making the budget presentable only every three years, and the constitution ceased to have any active existence.

In 1830 Louis was succeeded as grand-duke by his half-brother Leopold, the first of the Hochberg line. The July Revolution led to no disturbances in Baden; but the new grand-duke from the first showed liberal tendencies. The elections of 1830 were not interfered with; and the result was the return of a Liberal majority. The next few years saw the introduction, under successive ministries, of Liberal reforms in the constitution, in criminal and civil law, and in education. In 1832 the adhesion of Baden to the Prussian Zollverein did much for the material prosperity of the country. With the approach of the revolutionary year 1848, however, Radicalism once more began to lift up its head. At a popular demonstration held at Offenburg on the 12th of September 1847, resolutions were passed demanding the conversion of the regular army into a national militia which should take an oath to the constitution, a progressive income-tax and a fair adjustment of the interests of capital and labour.

The news of the revolution of February 1848 in Paris brought this agitation to a head. Numerous public meetings were held at which the Offenburg programme was adopted, and on the 4th of March, under the influence of the popular excitement, it was accepted almost unanimously by the lower chamber. As in other German states, the government bowed to the storm, proclaimed an amnesty and promised reforms. The ministry was remodelled in a more Liberal direction; and a new delegate was sent to the federal diet at Frankfort, empowered to vote for the establishment of a parliament for united Germany. The disorders, fomented by republican agitators, none the less continued; and the efforts of the government to suppress them with the aid of federal troops led to an armed insurrection. For the time this was mastered without much difficulty; the insurrection culminated in the tragic battle of April 26 at Baden-Pfullendorf, where they held, fell on the 24th; and on the 27th a Franco-Prussian "legion," which had invaded Baden from Strassburg, was routed at Dossenbach.

At the beginning of 1849, however, the issue of a new constitution, in accordance with the resolutions of the Frankfort parliament, led to more serious trouble. It did little to satisfy the Radicals, who were angered by the refusal of the second chamber to agree to their proposal for the summoning of a
constituent assembly (10th of February 1849). The new insurrection that now broke out was a more formidable affair than the first. A military mutiny at Rastatt on the 11th of May showed that the army sympathized with the revolution which was proclaimed two days later at Offenburg amid tumultuous scenes. On the same day (13th of May) a mutiny at Karlsruhe forced the grand-duke to take to flight, and the next day he was followed by the ministers, while a committee of the diet under Lorenz Brentano (1813-1891), who represented the more moderate Radicals as against the republicans, established itself in the capital to attempt to direct affairs pending the establishment of a provisional government. This was accomplished on the 1st of June, and on the 10th the "constituent diet," consisting entirely of the most "advanced" politicians, assembled. It had little chance of doing more than make speeches; the country was in the hands of an armed mob of civilians and mutinous soldiers; and, meanwhile, the grand-duke of Baden had joined with Bavaria in requesting the armed intervention of Prussia, which was granted on the condition that Baden should join the League of the Three Kings.

From this moment the revolution in Baden was doomed, and with it the revolution in all Germany. The Prussians, under Prince William (afterwards emperor), invaded Baden in the middle of June. The insurgent forces were under the command of the Pole, Ludwig von Miereslawski (1814-1878), who reduced them to some semblance of order. On the 30th he met the Prussians at Waghäusel, and was completely defeated; on the 25th Prince William entered Karlsruhe; and at the end of the month the members of the provisional government, who had taken refuge at Freiburg, dispersed. Such of the insurgent leaders as were caught, notably the ex-officers, suffered military execution; the army was dispersed among Prussian garrison towns; and Baden was occupied for the time by Prussian troops. The grand-duke returned on the 19th of August, and at once dissolved the diet. The elections resulted in a majority favourable to the new ministry, and a series of laws were passed of a reactionary tendency with a view to strengthening the government.

The grand-duke Leopold died on the 24th of April 1832, and was succeeded by his second son, Frederick, as regent, the eldest, Louis (d. 22nd of January 1838), being incapable of ruling. The internal affairs of Baden during the period that followed have comparatively little general interest. In the greater politics of Germany, Baden, between 1850 and 1866, was a consistent supporter of Austria; and in the war of 1866 her contiguous, under Prince William, had two sharp engagements with the Prussian army of the Main. Two days before the affair at Wachau (24th of July), however, the second in which he had petitioned the grand-duke to end the war and enter into an offensive and defensive alliance with Prussia. The grand-duke had from the first been opposed to the war with Prussia, but had been forced to yield owing to popular resentment at the policy of Prussia in the Schleswig-Holstein question (q.v.). The ministry, now at one, resigned; Baden announced her withdrawal from the German federation; and on the 17th of August a treaty of peace and alliance was signed with Prussia. The adhesion of Baden to the North German confederation was prevented by Bismarck himself, who had no wish to give Napoleon III. so good an excuse for intervention; but it was the opposition of Baden to the formation of a South German confederation that made the ultimate union inevitable. The troops of Baden took a conspicuous share in the war of 1870; and it was the grand-duke of Baden, who, in the historic assembly of the German princes at Versailles, was the first to hail the king of Prussia as German emperor.

The internal politics of Baden, both before and after 1870, centre in the main round the question of religion. The signing on the 28th of June 1859 of a concordat with the Holy See, by which education was placed under the oversight of the clergy and the establishment of religious orders was facilitated, led to a constitutional struggle, which ended in 1863 with the victory of Liberal principles, the communes being made responsible for education, though the priests were admitted to a share in the management. The quarrel between Liberalism and Clericalism was, however, not ended. In 1867, on the accession to the sovereignty of Julius von Jolly (1822-1867), several constitutional changes in a Liberal direction were made; responsibility of ministers, freedom of the press, compulsory education. In the same year (6th of September) a law was passed to compel all candidates for the priesthood to pass the government examinations. The archbishop of Freiburg resisted, and, on his death in April 1868, the see was left vacant. In 1869 the introduction of civil marriage did not tend to allay the strife, which reached its climax after the proclamation of the dogma of papal infallibility in 1870. The "Kulturkampf" raged in Baden, as in the rest of Germany; and here as elsewhere the government encouraged the formation of Old Catholic communities. Not till 1880, after the fall of the ministry of Jolly, was a reconciliation with Rome effected; in 1882 the archbishopric of Freiburg was again filled up. The political tendency of Baden, meanwhile, mirrored that of all Germany. In 1861 the National Liberals had but a majority of one in the diet; from 1863 they could maintain themselves only with the aid of the Conservatives; and in 1867 a coalition of Ultramontanes, Socialists, Social-democrats and Radicals (Freisinnige), won a majority for the opposition in the chamber. Amid all these contests the wise and statesmanlike moderation of the grand-duke as prince, and as a German prince, won him universal esteem. By the treaty of Buda, which Baden had been able to secure, apart from the German empire, he had reserved only the exclusive right to tax beer and spirits; the army, the post-office, railways and the conduct of foreign relations were placed under the effective control of Prussia. In his relations with the German empire, too, Frederick proved himself rather a great German noble than a sovereign prince actuated by particularist ambitions; and his position as husband of the emperor William I.'s only daughter, Louise (whom he had married in 1856), gave him a peculiar influence in the council of Berlin. When, on the 20th of September 1906, the grand-duke celebrated at once the jubilee of his reign and his golden wedding, all Europe combined to do him honour. King Edward VII. sent him, by the hands of the duke of Connaught, the order of the Garter. But more significant, perhaps, was the tribute paid by the Tempes, the leading Parisian paper. "Nothing more clearly demonstrates the sterile paradox of the Napoleonic work," it wrote, "than the history of the grand-duchy. It was Napoleon, and he alone, who created this whole state in 1803 to reward in the person of the little margrave of Baden a relative of the emperor of Russia. It was he who after Austerlitz aggrandized the margravate at the expense of Austria; transformed it into a sovereign principality and raised it to a grand-duchy. It was he to some extent by the secularization on the one hand and by the dismemberment of Wurttemberg on the other, gave the grand-duke 500,000 new subjects. He believed that the recognition of the prince and the artificial ethnical formation of the principality would be pledges of security for France. But in 1813 Baden joined the coalition, and since then that nation created of odds and ends (de brie et de broc) and always handsomely treated by us, had not ceased to take a leading part in the struggles against our country. The grand-duke Frederick, grand-duke by the will of Napoleon, has done France all the harm he could. But French opinion itself renders justice to the probity of his character and to the ardour of his patriotism, and nobody will feel surprise at the homage with which Germany feels bound to surround his old age."

He died at Mainau on the 28th of September 1907, and was succeeded by his son, the grand-duke Frederick II.
BADENOCH—BADHAM

Badische Landtagsgeschichte (Berlin, 1899-1902); E. von Chissmar, Genealogie des Gesamtbades Baden vom 16. Jahrhundert bis heute (Gotha, 1892); E. Meyer, Badisches Volksleben im 19. Jahrhundert (Strassburg, 1900); F. J. Mone, Quellensammlung zur badischen Landtagsgeschichte, 1848-1867); Badische Biographien, edited by F. von Weech (Karlsruhe, 1875-1891).

BADENOCH, a district of south-east Inverness-shire, Scotland, bounded on the N. by the Monadhliath mountains, on the E. by the Cairngorms and Braemar, on the S. by Atholl and the Grampians, and on the W. by Lochaber. Its area is somewhat undefined, but it may be estimated to measure 36 m. from N.E. to S.W. and 15 m. from N. to S. Excepting the valley of the Spey and the great glens, it is almost entirely a wild mountainous tract, many hills exceeding 3000 ft. in height, and contains in the forests of Alder, Drumochter, Gaick and Feshie some of the best deer country in the Highlands. Loch Laggan and Loch Ericht are the principal lakes, and the district is abundantly watered by the Spey and its numerous tributaries. It is traversed, from Dalmaspald to Boat of Garten, by the Highland railway. There are very few industries, and population groups itself at Kingussie and other places on or near the Spey. From 1229 to 1313 the lordship of Badenoch was owned by the Comyns. In 1371 Robert II. granted it to his son Alexander Stewart, 1st earl of Buchan (1343-1405), the “Wolf of Badenoch.” Reverting to the crown, it was bestowed in 1452 upon the 1st earl of Huntly, and still gives the title of lord of Badenoch to the marquess of Huntly.

BADENWEILER, a health resort and watering place of the grand-duchy of Baden, Germany, 28 m. N. by E. by rail from Basel, at the western edge of the Black Forest. It is sheltered by the Blauen (3820 ft.) and the climate is excellent. Its new parish (Evangelical) church (1807) is built at the foot of the 11th-century castle which belonged to the margraves of Baden, and was destroyed by the French during the wars of Louis XV. The place is visited by 5000 people annually, partly for its warm mineral springs (70° F.), partly for its whey cure, and partly on account of its equable climate and picturesque surroundings. There are a Kurhaus, built in 1853, and a park of 15 acres, also a grand-ducal castle, rebuilt in 1887-1888. In 1784 well-preserved Roman baths were discovered here. The permanent population is about 600.

BADGER, the common name for any animal of the Mustelide subfamily Melinae or the typical genus Meles (see Carnivora). The name is probably derived from the “badge,” device, on account of the marks on the head; or it may be identical with the term separately noticed below, the French blaireau being used in both senses. The members of the typical genus have the lower jaw so articulated to the upper, by means of a transverse condyle firmly locked into a long cavity of the cranium, that dislocation of the jaw is all but impossible, and this enables those creatures to maintain their hold with the utmost tenacity. The European badger (Meles taxus or M. m. taxus) is from 25 in. to 29 in. long, with a tail of about 5 in.; the general hue of the fur is grey above and black on the under parts; the head is white, with a black stripe on either side. In the Irish badger, typical of this country, there is nowhere abundant, but is found over the northern parts of Europe and Asia, and is a quiet, inoffensive animal, nocturnal and solitary in its habits, sleeping by day in its burrow, and issuing forth at night to feed on roots, beechnut, fruits, the eggs of birds, small quadrupeds, frogs and insects. It is said also to dig up the nests of wasps in order to eat the larvae, as the ratel—a closely allied South African form—is said to rob the bees of their honey. The male and female are seldom seen together, and are supposed to trace each other by the odor of the secretion in the anal glands. Fossil remains of the badger have been found in England in deposits of Pliocene age. In eastern Persia this species is replaced by the Persian badger (M. canescens); two species—the white-tailed badger (M. leucurus) and the Chinese badger (M. chinesis) occur in Eastern Asia; and another (M. anacanum) is found in Japan. The American badger (Taxidea amerciana) ranges over the greater part of the United States, and in habits closely resembles the European species, but seems to be more carnivorous. When badgers were more

abundant than they now are, their skins, dressed with the hair attached, were commonly used for pistol furniture. They are now highly valued for the hair, that of the European badger being used in the manufacture of the best shaving-brushes while the softer hair of the American species is employed for the same purpose, and also for painters' pencils, and the fur is used for articles of ladies' apparel and trimmings. The Malay badger (Myalus melicus) is confined to the mountains of Java (where it is called the teledu), Sumatra and Borneo. The head and body are about 15 in. long, and the tail no more than an inch: the fur is dark brown, with the top of the head, neck and a broad dorsal stripe, white. Like the skunk, this animal can eject the foetid secretion of the anal glands. The sand-badgers (Arctonyx) are Asiatic; the best-known species (A. collaris) ranges from the eastern Himalayas to Burma; the smaller A. terrestris is found in Assam, Arakan and perhaps in China; and there is probably another in Tibet. In these the tail is much longer in proportion to the body than in the rest of the group.

The badger does not usually seek to attack, but, when driven to bay, its great muscular power and tough hide render it a formidable antagonist. That the cruel sport of bear-badging was formerly popular throughout Great Britain, but has been prohibited about the middle of the 19th century, together with bear-baiting and bull-baiting. The badger-ward, who was usually attached to a bear-garden, kept his badger in a large box. Whenever a drawing was arranged, bets were made as to how many times the dog, usually a bull-terrier, would draw the badger, i.e. pull it out of its box, within a given number of minutes. As soon as the dog succeeded in doing this the animals were parted, often by the attendants biting their tails, and the badger was again shut up in his box, which, at a signal from the time-keeper, was again opened. Another method of baiting this animal is thus described in the Encyclopaedia of Sport: “They dig a place in the earth about a yard long, so that one end is four feet deep. At this end a strong stake is driven down. Then the badger's tail is split, a chain put through it, and fastened to the stake with such ability that the badger can come up to the other end of the place. The dogs are brought and set upon the poor animal who sometimes destroys several dogs before it is killed.” The colloquial “to badger” (i.e. worry or tease) is a metaphorical derivative, and “drawing a badger” is similarly used in a figurative sense.

BADGER, a term of uncertain derivation (possibly derived from bagger, in allusion to the hawkers' bag) for a dealer in food, such as corn or victuals (more expressly, fish, butter or cheese), which he has purchased in one place and brought for sale to another place; an itinerant dealer, corresponding to the modern hawker or huckster. An English statute of 1552 which summarised, and prescribed penalties against, the offences of encroasing, forestalling and regrating, specially exempted badgers from these penalties, but required them to be licensed by three justices of the peace for the county in which they dwell. A statute of 1565-1566, after declaring that many people took up the trade of badgering “seeking only to live easily and to leave their trades,” ordered that badgers should be licensed for a year only, should be kept within the counties for three years, standing in the county in which they were licensed, and should enter into recognizances not to engross or forestall. An act of 1844 abolished the offence of badgering, and repealed the statutes passed in relation to it. The word is still in common use in county districts.

BADGHS ("home of the winds"), a district on the north-west of Afghanistan, between the Murghab and Hari Rud rivers, extending as far northward as the edge of the desert of Sarakhs. It includes the Chul formations through which the Russo-Afghan boundary runs. This region was surveyed by the boundary commission of 1885. Since that date it has been largely settled by the amir with purely Afghan tribes.

BADHAM, CHARLES (1833-1884), English scholar, was born at Ludlow, in Shropshire, on the 18th of July 1813. His father, Charles Badham, translator of Juvenal and an excellent classical scholar, was regius professor of physic at Glasgow; his mother was a cousin of Thomas Campbell, the poet. When about seven
years old, Badminton was sent to Switzerland, where he became a pupil of Pestalozzi. He was afterwards transferred to Eton, and in 1830 was elected to a scholarship at Wadham College, Oxford, but only obtained a third class in classics (1830), a failure which may have been due to his dislike of the methods of study then in fashion at Oxford, at a time when classical scholarship was in a very unsatisfactory condition. Shortly after taking his degree in 1837 Badminton went to Italy, where he occupied himself in the study of ancient MSS., in particular those of the Vatican library. It was here that he began a life-long friendship with G. C. Cobet. He afterwards spent some time in Germany, and on his return to England was incorporated M.A. at Peterhouse, Cambridge, in 1847. Having taken holy orders, he was appointed headmaster of Louth grammar school, Lincolnshire (1851–1854), and subsequently headmaster of Edgbaston proprietary school, near Birmingham. In the interval he had taken the degree of D.D. at Cambridge (1852). In 1860 he received the honorary degree of doctor of letters at the university of Leiden. In 1886 he left England to take up the professorship of classics and logic in Sydney University, which he held until his death on the 26th of February 1884. He was twice married. Dindorf's classical attainments were recognized by the most famous European critics, such as G. C. Cobet, Ludwig Preller, W. Dindorff, F. W. Schneidewin, J. A. F. Meineke, A. Ritschel and Tischendorf. Like many schoolmasters who are good scholars and even good teachers, he was not a professional success; and his hasty temper and dislike of anything approaching disingenuousness may have stood in the way of his advancement. But it is strange that a scholar and textual critic of his eminence and of European reputation should have made comparatively little mark in his native country. He published editions of Euripides, *Helenae et Iphigiae in Tauris* (1851), *Iom* (1851); Plato's *Philebus* (1855, 1878); *Laches* and *Euthydemus* (1856), *Phaedrus* (1851), *Symposium* (1860) and *Platonis Epistolae* (1860). He also contributed to *Bnemosyne* (Cobet's journal) and other classical periodicals. His *Adhortatio ad Discipulos Academiae Suidiensis* (1860) contains a number of emendations of Thucydides and other classical authors. He also published an article on "The Text of Shakespeare in Cambridge Essays (1856); "Criticism applied to Shakespeare" (1865); *Thoughts on Classical and Commercial Education* (1864). A collected edition of his *Speeches and Lectures delivered in Australia* (Sydney, 1890) contains a memoir by Thomas Butler. 

**BADIUS, JODOCUS or JOSE (1462–1535), sometimes called BADIUS ASCENSIVS from the village of Asche, near Brussels, where he was born, an eminent printer at Paris, whose establishment was celebrated under the name of *Pratum Ascensivum.* He was himself a scholar of considerable repute, had studied at Brussels and Ferrara, and before settling in Paris, had taught Greek for several years at Lyons. He illustrated with notes several of the classics which he printed, and was the author of numerous pieces, amongst which is a life of Thomas à Kempis, and a satire on the follies of women, entitled *Noticia Stalvarum Multierum.*

**BADLESME, BARTHOLOMEW, BARON (1275–1322), English nobleman, was the son and heir of Gunselm de Badlesme (d. 1301), and fought in the English army both in France and Scotland during the later years of the reign of Edward I. In 1307 he became governor of the County of London, and afterwards Edward II appointed him steward of his household; but these marks of favour did not prevent him from making a compact with some other noblemen to gain supreme influence in the royal council. Although very hostile to Earl Thomas of Lancaster, Badlesmere helped to make peace between the king and the earl in 1318, and was a member of the middle party which detested alike Edward's minions, like the Despensers, and his violent enemies like Lancaster. The king's conduct, however, drew him to the side of the earl, and he had already joined Edward's enemies when, in October 1321, his wife, Margaret de Clare, refused to admit Queen Isabella to her husband's castle at Leeds in Kent. The king captured the castle, seized and imprisoned Lady Badlesme, and civil war began. After the defeat of Lancaster at Boroughbridge, Badlesme was taken and hanged at Canterbury on the 24th of April 1322. His son and heir, Giles, died without issue in 1338.

**BADMINTON, or GREAT BADMINTON, a village in the southern parliamentary division of Gloucestershire, England, 100 m. W. of London by the Great Western railway (direct line to south Wales). Here is Badminton House, the seat of the dukes of Beaufort, standing in a park some 10 m. in circumference. The manor of Badminton was acquired in 1668 from Nicolas Boteler (to whose family it had belonged for several centuries) by Thomas, Viscount Somerset (d. 1650 or 1651), third son of Edward, 4th earl of Worcester, and was given by his daughter and heiress Elizabeth to Henry Somerset, 3rd marquess of Worcester and 1st duke of Beaufort (1629–1699), who built the present mansion (1682) on the site of the old manor house. It is a stone building in Palladian style, and contains a number of splendid paintings and much fine wood-carving. The parish church of St. Michael stands close to it. This is a Grecian building (1785), with a richly ornamented ceiling and inlaid737 pavements; it also contains much fine sculpture in the memorials to former dukes, and is the burial-place of Field Marshal Lord Raglan, who was the youngest son of the 5th duke of Beaufort, and was in command of the British forces during the Crimean War. The mansion passed from the family of the earls of Worcester to the earls of Essex in 1831.

**BADMINTON, a game played with rackets and shuttlecocks, its name being taken from the duke of Beaufort's seat in Gloucestershire. The game appears to have been first played in England about 1873, but before that time it was played in India, where it is still very popular. The Badminton Association in England was founded in 1895, and its laws were framed from a code of rules drawn up in 1887 for the Bath Badminton Club and based on the original Poona (1876) rules. In England the game is almost always played in a covered court. The All England championships for gentlemen's doubles, ladies' doubles, and mixed doubles were instituted in 1890, and for gentlemen's singles and ladies' singles in 1900; and the first championship between England and Ireland was played in 1904. Badminton may be played by daylight or by artificial light, either with two players on each side (the four-handed or double game) or with a single player and a shuttlecock. The game consists entirely of volleying and is extremely fast, a single at Badminton being admitted to require more staying power than a single at lawn tennis. There is much scope for judgment and skill, e.g. "dropping" (hitting the shuttle gently just over the net) and in "smashing" (hitting the shuttle with a hard downward stroke). The measurements of the court are shown on the accompanying plan. The Badminton hall should be not less than 18 ft. high. Along the net line is stretched a net 30 in. deep, from 17 to 24 ft. long according to the position of the posts, and edged on the top with white tape 3 in. wide. The top of the net should be 5 ft. from
the ground at the centre and 5 ft. 1 in. at the posts. The shuttlecock (or shuttle) has 16 feathers from 2½ to 2¾ in. long, and weighs from 73 to 85 grains. The racket (which is of no specified size, shape or weight) is strung with strong linen gut and weighs as a rule about 6 oz. The game is for 15 or, rarely, for 21 aces, except in ladies' singles, when it is for 11 aces; and a rubber is the best of three games. Games of 21 aces are played only and always in matches decided by a single game, and generally in handicap contests. The right to choose ends or to serve first in the first game of the rubber is decided by tossing. If the side which wins the toss chooses first service, the other side chooses ends, and vice versa; but the side which wins the toss may call upon the other side to make first choice. The sides change ends at the beginning of the second game, and again at the beginning of the third game, if a third game is necessary. In the third game the sides change ends when the side which is leading reaches 8 in a game of 15 aces, and 6 in a game of 11 aces, or, in handicap games, when the score of either side reaches half the number of aces required to win the game. In matches of one game (21 aces) the sides change ends when the side which is leading has scored 11 aces. The side winning a game serves first in the next game, and, in the four-handed game, either player on the side that has won the last game may take first service in the next game. In a game of 15 aces, when the score is "13 all" the side which first reaches 13 has the option of "setting" the game to 5, and when the score is "14 all" the side which first reaches 14 has the option of "setting" the game to 3, i.e. the side which first scores 5 or 3 aces, according as the game has been "set" at "13 all" or "14 all," wins. In ladies' singles, when the score is "9 all" the side first reaching 9 may "set" the game to 5, and when the score is "10 all" the side which first reaches 10 may "set" the game to 3. In games of 21 aces, the game may be "set" to 5 at "19 all" and to 3 at "20 all." There is no "setting" in handicap games. In the four-handed game, the player who serves first stands in his right-hand half court and serves to the player who is standing in the opposite right-hand half court, the other players meanwhile standing anywhere on their side of the net. As soon as the shuttle is hit by the server's racket, all the players may stand anywhere on their side of the net. If the player served to returns the shuttle, i.e. hits it into any part of his opponents' court, it does not touch the ground, it has to be returned by one of the "in" (serving) side, and then by one of the "out" (non-serving) side, and so on, until a "fault" is made or the shuttle ceases to be "in play." If the "in" side makes a "fault," the server loses his "hand" (serve), and the player served to becomes the server; but no score accrues. If the "out" side makes a "fault," the "in" side scores an ace, and the players on the "in" side change half courts, the server then serving from his left half court to the player in the opposite left half court, who has not yet been served to. Only the player served to may take the service, and only the "in" side can score an ace. The first service in each innings is made from the right-hand half court. The side that starts a game has only one "hand" in its first innings; in every subsequent innings each player on each side has a "hand," the partners serving consecutively. While a side remains "in," service is made alternately from each half court into the half court diagonally opposite, the change of half courts taking place whenever an ace is scored. If, in play, the shuttle strikes the net but still goes over, the stroke is good; but if this happens in service and the service is otherwise good, it is a "let," i.e. the stroke does not count, and the server must serve again, even if the shuttle has not hit the net. If a stroke is returned in the net, in no case it is assumed that the shuttle would have fallen into the other half court. It is a "let," too, if the server, in attempting to serve, misses the shuttle altogether. It is a good stroke, in service or in play, if the shuttle falls on a line, or, in play, if it is followed over the net with the striker's racket, or passes outside either of the net posts and then drops inside any of the boundary lines of the opposite court. *Mutatis mutandis,* the above remarks apply to the two-handed game, the main points of difference being that, in the two-handed game, both sides change half courts after each ace is scored and the same player takes consecutive serves, whereas in the double game only the serving side changes half courts at an added ace and a player may not take two consecutive serves in the same game.

It is a "fault" (a) if the service is overhand, i.e. if the shuttle when struck is higher than the server's waist; (b) if, in serving, the shuttle does not fall into the half court diagonally opposite that from which service is made; (c) if, before the shuttle is struck by the server, both feet of the server and of the player served to are not inside their respective half courts, a foot on a line being deemed out of court; (d) if, in play, the shuttle falls outside the court, or, in service or play, passes through or under the net, or hangs in the net, or touches the roof or side walls of the hall or the person or dress of any player; (e) if the shuttle "in play" is hit before it reaches the striker's side; (f) if the shuttle "in play" is hit after it has been touched by the other player; (g) if the shuttle is struck twice successively by the same player, or if it is struck by a player and his partner successively, or if it is not distinctly hit, i.e. if it is merely caught on the racket and spooned over the net; (h) if a player wilfully obstructs his opponent.

For full information on the laws of the game the reader is referred to the Laws of Badminton and the Rules of the Badminton Association, published annually (London). See also an article by S. M. Massey in the Badminton Magazine (February 1907), reprinted in a slightly revised form in the Badminton Gazette (November 1907). Until October 1907 Lawn Tennis and Badminton was the official organ of the Badminton Association; in November 1907 the Badminton Gazette became the official organ.

**BADNUR,** a town of British India, the headquarters of the district of Betul in the Central Provinces. It consists, besides the European houses, of two bazaars. Pop. (1901) 5766. There is a good serai or inn for native travellers, and a dak bungalow or resting-place for Europeans. Not far from Badnur is Kherla, the former residence of the Gond rajas, where there is an old fort, now in ruins, which used to be held by them.

**BADRINATH,** a village and celebrated temple in British India, in the Garhwal district of the United Provinces. It is situated on the right bank of the Vishnuganga, a tributary of the Alaknanda river, in the middle of a valley nearly 4 m. in length and 1 in breadth. The village is small, containing only twenty or thirty huts in which are the resident Brahmans and the attendants of the temple. This building, which is considered a place of high sanctity, is by no means equal to its great celebrity. It is about 40 or 50 ft. in height, built in the form of a cone, with a small cupola, on the top of which is a gilt ball and spire, and contains the shrine of Badrinath, dedicated to an incarnation of Vishnu. The principal idol is of black stone and is 3 ft. in height. Badrinath is a favourite resort of pilgrims from all parts of India. In ordinary years the number varies from 7000 to 10,000; but every twelfth year, when the festival of Kumbh-mela is celebrated, the concourse of persons is said to be 50,000. In addition to the gifts of votaries, the temple enjoys a further source of revenue from the rents of villages assigned by former rajas. Successive temples have been shatterted by avalanches, and the existing building is modern. It is situated among mountains rising 23,000 ft. above the level of the sea. Elevation of the site of the temple, 10,944 ft.

**BADULLA,** the capital of the province of Uva, Ceylon, 54 m. S. E. of Kandy. It is the seat of a government agent and district judge, besides minor courts. It was in Kandyian times the home of a prince who ruled Uva as a principality. Badulla stands 132 ft. above sea-level; the average annual rainfall is 70½ in.; the average temperature, 73°. The population of the town in 1901 was 5204; of the Badulla district, 186,674. There is a botanic garden; and the town, being almost encircled by a river—the Badullaya—and overshadowed by the Naminacooy Kande range of mountains (highest peak 6680 ft.), is very
picturesquely situated. The railway terminus at Bandarawella is 18 m. from Badulla. Tea is cultivated by the planters, and rice, fruit and vegetables by the natives in the district.

**BAEDEKER, KARL** (1801–1859), German publisher, was born at Essen on the 3rd of November 1801. His father had a printing establishment and book-shop there, and Karl followed the same business independently in Coblenz. Here he began to issue the first of the series of guide-books with which his name is associated. They followed the model of the English series instituted by John Murray, but developed in the course of years so as to cover the greater part of the civilized world, and later were issued in English and French as well as German. Baecker's son Fritz carried on the business, which in 1872 was transferred to Leipzig.

**BAEHR, JOHANN CHRISTIAN FELIX** (1798–1872), German philologist, was born at Darmstadt on the 13th of June 1798. He studied at the university of Heidelberg where he was appointed professor of classical philology in 1823, chief librarian in 1832, and on the retirement of G. F. Creuzer became director of the philological seminary. He died at Heidelberg on the 29th of November 1872. His earliest works were editions of Plutarch's **Achibades** (1821), **Philopoemen, Flamininus, Pyrrhus** (1826), and of *Hercules* (1827–1828, 1852–1853). But most important of all were his works on Roman literature and humanistic studies in the middle ages: *Geschichte der romanischen Literatur* (4th ed., 1868–1870), and the supplementary volumes, *Die christlichen Dichter und Geschichtsschreiber Romans* (2nd ed., 1872), *Die christlich-romische Theologie* (1837), *Geschichte der romanischen Literatur im karolingschen Zeitalter* (1840).

**BAEL FRUIT** (*Aegle marmelos*). *Aegle* is a genus of the botanical natural order Rutaceae, containing two species in tropical Asia and one in west tropical Africa. The plants are trees bearing strong spines, with alternate, compound leaves each with three leaflets and panicles of sweet-scented white flowers. *Aegle marmelos*, the bael or bel fruit (also known as Bengal quince), is found wild or cultivated throughout India. The tree is valued for its fruit, which is oblong to pyriform in shape, 2–5 in. in diameter, and has a grey or yellow rind and a sweet, thick orange-coloured pulp. The unripe fruit is cut up in slices, sun-dried and used as an astringent; the ripe fruit is described as sweet, aromatic and cooling. The wood is yellowish-white, and hard and durable. The name *Aegle* is from one of the Hesperides, in reference to the golden fruit; *marmelo* is Portuguese for quince.

**BAENA**, a town of southern Spain, in the province of Cordova; 32 m. by road S.E. of the city of Cordova. Pop. (1900) 14,539. Baena is picturesquely situated near the river Marbella, on the slope of a hill crowned with a castle, which formerly belonged to the famous captain Gonzalo de Cordova. Farming, horse-breeding, linen-weaving and the manufacture of olive-oil are the chief local industries. The nearest railway station is Luque (pop. 4072), 4 m. S.E. on the Jaen-Lucena line. The site of the Roman town (Baniana or Biniana) can still be traced, and various Roman antiquities have been disinterred. In 1829, the Moors under Mahomed II. of Granada vainly besieged Baena, which was held for Sancho IV. of Castile; and the five Moorish heads in its coat-of-arms commemorate the defence.

**BAER, KARL ERNST VON** (1792–1856), German biologist, was born at Plej, in Estonia, on the 29th of February 1792. His father, a small landowner, sent him to school at Reval, which he left in the eleventh year to study medicine at Dorpat University. The lectures of K. F. Burdach (1776–1847) suggested research in the wider field of life-history, and as at that time Germany offered more facilities for, and greater encouragement to, scientific work, von Baer went to Würzburg, where J. I. J. Döllinger (1770–1841), father of the Catholic theologian, was professor of anatomy. In teaching von Baer, Döllinger gave a direction to his studies which secured his future pre-eminance in the science of organic development. He collaborated with C. H. Pander (1794–1863) in researches on the evolution of the chick, the results of which were first published in Burdach's treatise on physiology. Continuing his investigations alone, von Baer extended them to the evolution of organisms generally, and after a sojourn at Berlin he was invited by his old teacher Burdach, who had become professor of anatomy at Königsberg, to join him as prosector and chief of the new zoological museum (1812). Von Baer's great discovery of the human ovum is the subject of his *Epistola de Ovo Mammalium et Hominis Genesi* (Leipzig, 1827), and in the following year he published the first part of his *History of the Evolution of Animals* (*Über die Entwicklungsgeschichte der Thiere*), the second part following in 1837. In this work he demonstrated first, that the Graafian follicles in the ovary are not the actual eggs, but that they contain the spherical vesicle, which is the true ovum, a body about the one hundred and twentieth of an inch in diameter, wherein lie the properties transmitting the physical and mental characteristics of the parent or grandparent, or even of more remote ancestors. He next showed that in all vertebrates the primary stage of cleavage of the fertilized egg is followed by modification into leaf-like germ-layers—skin, muscular, vascular and mucous—whence arise the several organs of the body by differentiation. He further discovered the gelatinous, cylindrical cord, known as the *chorda dorsalis*, which passes along the body of the embryo of vertebrates, in the lower types of which it extends to the entire inner skeleton, while in the higher the backbone and skull are developed from the corresponding stages " in the development of vertebrate embryos" was exemplified in the fact recorded by him about certain specimens preserved in spirit which he had omitted to label. "I am quite unable to say to what class they belong. They may be lizards, or small birds, or very young mammals, so complete is the similarity in the mode of formation of the head and trunk in these animals. The extremities are still absent, but even if they had existed in the earliest stage of the development we should learn nothing, because all arise from the same fundamental form." Again, in his *History of Evolution* he suggests, "Are not all animals in the beginning of their development essentially alike, and is there not a primary form common to all?" (I. p. 223). Notwithstanding this, the "telec" idea, with the archetypal theory which it involved, possessed von Baer to the end of his life, and explains his inability to accept the theory of unbroken descent with modification when it was propounded by Charles Darwin and A. R. Wallace in 1858. The influence of von Baer's discoveries has been far-reaching and abiding. Not only was he the pioneer in that branch of biological science to which Francis Bacon, gathering up the labours of many fellow-workers, gave coherence in his *Comparative Zoology* (1801), but the impetus to T. H. Huxley's researches on the structure of the *modusae* came from him (Life, i. 163), and Herbert Spencer found in von Baer's "law of development" the "law of all development" (Essays, i. 301).

In 1834 von Baer was appointed librarian of the Academy of Sciences of St. Petersburg. In 1835 he published his *Development of Fishes*, and as the result of collection of all available information concerning the fauna and flora of the Polar regions of the empire, he was appointed leader of an Arctic expedition in 1837. The remainder of his active life was occupied in various fields of research, geological as well as biological, an outcome of the latter being his fine monograph on the fishes of the Baltic and Caspian Seas. One of the last works from his prolific pen was an interesting autobiography published at the expense of the Estonian nobles on the celebration of the jubilee of his doctorate in 1864. Three years afterwards he received the Copley medal. He died at Dorpat on the 28th of November 1876. (E. CL.)

**BAER, WILLIAM JACOB** (1866– ), American painter, was born in Cincinnati, Ohio, on January 1866. He studied at Munich in 1882 and by hard work much to do with the revival in America of the art of miniature-painting to which he returned in 1892 and was the first president of the Society of Painters in a Miniature, New York. Among his miniatures are "The Golden Hour," "Daphne," "In Arcadia" and "Madonna with the Auburn Hair."

**BAETYLUS** (Gr. *βατυλός, βατύλων*), a word of Semitic origin (=bethel) denoting a sacred stone, which was supposed to be endowed with life. These fetish objects of worship were meteoric stones, which were dedicated to the gods or revered as symbols of the gods themselves (Pliny, *Nat. Hist.* xvii. 9; Photius, *Cod.* 242).
In Greek mythology the term was specially applied to the stone supposed to have been swallowed by Cronus (who feared misfortune from his own children) in mistake for his infant son Zeus, for whom it had been substituted by Uranus and Gaia, his wife's parents (Etymologicum Magnum, s.v.). This stone was carefully preserved at Delphi, anointed with oil every day and on festal occasions covered with raw wool (Pausanias x. 24). In Phoenician mythology, one of the sons of Uranus is named Baetylus. Another famous stone was the effigy of Rhea Cybele, the holy stone of Pessinus, black and of irregular form, which was brought to Rome in 204 B.C. and placed in the mouth of the statue of the godess. In some cases an attempt was made to give a more regular form to the original shapeless stone: thus Apollo Agyioustes was represented by a conical pillar with pointed end, Zeus Mellichus in the form of a pyramid. Other famous baetylic idols were those in the temples of Zeus Carius at Seleneia, and of Zeus Telelios at Tegea. Even in the declining years of paganism, these idols still retained their significance, as is shown by the attacks upon them by ecclesiastical writers.

See Munter, *Über die vom Himel gefallenen Steine* (1800); *Böckh’s Reallexicon* (1854) give an article by F. Lenormant in Darmare and Saglio’s *Dictionary of Antiquities*.

### BAEYER, JOHANN FRIEDRICH WILHELM ADOLF VON (1835– ), German chemist, was born at Berlin on the 31st of October 1835, his father being Johann Jacob von Baeyer (1794–1882), chief of the Berlin Geodetical Institute from 1870. He studied chemistry under R. W. Bunsen and F. A. Kekulé, and in 1858 took his degree as Ph.D. at Berlin, becoming privat-doctor a few years afterwards and assistant professor in 1866. Five years later he was appointed professor of chemistry at Strassburg, and in 1875 he migrated in the same capacity to Munich. He devoted himself mainly to investigations in organic chemistry, and in particular to synthetic studies by the aid of "condensation" reactions. The Royal Society of London awarded him the Davy medal in 1881 for his researches on indigo, the nature and composition of which he did more to elucidate than any other single chemist, and which he also succeeded in preparing artificially, though his methods were not found commercially practicable. To celebrate his seventieth birthday his scientific papers were collected and published in two volumes (Gesammelte Werke, Berlin, 1905), and the names of the headings under which they are grouped give some idea of the range and extent of his chemical work:—(1) organic arsenic compounds, (2) uric acid group, (3) indigo, (4) papers arising from indigo researches, (5) pyrrol and pyridine bases, (6) experiments on the elimination of water and on condensation, (7) the phthaleins, (8) the hydro-aromatic compounds, (9) the terpenes, (10) nitroso compounds, (11) furufrol, (12) acetylene compounds and "strain" (Spmanns) theory, (13) peroxides, (14) basic properties of oxygen, (15) dibenzalanetone and triphenylamine, (16) various researches on the aromatic and (17) the aliphatic series.

### BAÉZA (anc. Beatia), a town of southern Spain, in the province of Jaén; in the Loma de Ubeda, a mountain range between the river Guadalquivir on the S. and its tributary the Guadalimar on the N. Pop. (1900) 14,379. Baéza has a station 3 m. S.W. on the Linares-Almeria railway. Its chief buildings are those of the university (founded in 1423, and replaced by a theological seminary), the cathedral and the Franciscan monastery. The Cordova and Ubeda gates, and the arch of Baéza, are among the remains of its old fortifications, which were of great strength. The town has little trade except in farm-produce; but its red dye, made from the native cochineal, was formerly celebrated. In the middle ages Baéza was a flourishing Moorish city, said to contain 50,000 inhabitants; but it was sacked in 1239 by Ferdinand III. of Castile, who in 1248 transferred its bishopric to Jaén. It was the birthplace of the sculptor and painter, Gaspar Becerra.

### BAPFIN, WILLIAM (1584–1622), English navigator and discoverer. Nothing is known of his early life, but it is conjectured that he was born in London of humble origin, and gradually raised himself by his diligence and perseverance. The earliest mention of his name occurs in 1612, in connexion with an expedition in search of a North-West Passage, under the orders of Captain James Hall, whom he accompanied as chief pilot. Captain Hall was murdered in a fight with the natives on the west coast of Greenland, and during the two following years Bapfin served in the Spitsbergen whale-fishery, at that time controlled by the Muscovy Company. In 1615 he entered the service of the Company for the discovery of the North-West Passage, and accompanied Captain Robert Bylot as pilot of the little ship "Discovery," and now carefully examined Hudson Strait. The accuracy of Bapfin’s tidal and astronomical observations on this voyage was confirmed in a remarkable manner by Sir Edward Parry, when passing over the same ground, two centuries later (1821). In the following year Bapfin again sailed as pilot of the "Discovery," and passing up Davis Strait discovered the fine bay to the north which now bears his name, together with the magnificent series of straits which radiate from its head and were named by him Lancaster, Smith and Jones Sounds, in honour of the generous patrons of his voyages. On this voyage he had sailed over 500 m. farther north than his predecessor Davis, and for 236 years his farthest north (about lat. 73° 45’ N.) remained unsurpassed in that sea. All hopes, and after Bapfin’s death new expeditions to the north were kept up by India, and in course of time even Bapfin’s discoveries came to be doubted until they were re-discovered by Captain Ross in 1818. Bapfin next took service with the East India Company, and in 1617–1619 performed a voyage to Surat in British India, and on his return received the special recognition of the Company for certain valuable surveys of the Red Sea and Persian Gulf which he had made in the course of the voyage. Early in 1620 he again sailed to the East, and in the Anglo-Persian attack on Kishm in the Persian Gulf, preparatory to the reduction of Ormuz, he received his death-wound and died on the 23rd of January 1622. Besides the importance of his geographical discoveries, Bapfin is to be remembered for the importance and accuracy of his numerous scientific and magnetic observations, for one of which (the determination of longitude at sea by lunar observation) the honour is claimed of being the first of its kind on record.

### BAFIN BAY and BAFIN LAND, an arctic sea and an insular tract named after the explorer William Bapfin. Bapfin or Bapfin’s Bay is part of the long strait which separates Bapfin Land from Greenland. It extends from about 69° to 78° N. and from 54° to 76° W. From the northern end it is connected (1) with the polar sea northward by Smith Sound, prolonged by Kane Basin and Kennedy and Robeson Channels; (2) with the straits which ramify through the archipelago to the north-west by narrow channels at the head of Jones Sound, from which O. Sverdrup and his party conducted explorations in 1900–1902; (3) with the more southerly part of the same archipelago by Lancaster Sound. Bapfin Bay was explored very fully in 1616 by Bapfin. The coasts are generally high, precipitous and deeply indented. The most important island on the east side is Disco, to the north of Disco Bay, Greenland. During the greater part of the year this sea is frozen, but, while hardly ever free of ice, there are normally navigable channels along the coasts from the beginning of June to the end of September connected by transverse channels. The bay is noted as a centre of the whale and seal fisheries. At more than one point a depth exceeds 100 fathoms, and no bottom has been ascertained.

Bapfin Land is a barren insular tract, included in Franklin district, Canada, with an approximate area of 235,000 sq. m., situated between 65° and 90° W. and 65° and 72° N. The eastern and northern coasts are rocky and mountainous, and are deeply indented by large bays including Frobisher and Home Bays, Cumberland Sound and Admiralty Inlet. Bapfin Land is separated from Greenland by Bapfin Bay and Davis Strait, from Ungava by Hudson Strait, from Keewatin and Melville Peninsula by Fox Channel and Fury-and-Hecla Strait, from Boothia Peninsula and North Somerset by the Gulf of Boothia and Prince Regent Inlet, and from North Devon by Lancaster Sound. Various names are given to various parts of the land—thus the north-western part is called Cockburn Land, farther
east is North Galloway; on the extreme eastern peninsula are Cumberland and Penny Lands, while the southern is Meta Incognita; in the west is Fox Land. In the southern part of the interior are two large lakes, Amadjuak, which lies at an altitude of 280 ft., and Nettling or Kennedy.

**BAGAMOYO**, a seaport of German East Africa in \(^6^\text{th} 2^2 S\), \(^{38}5^2 E\). Pop. about 18,000, including a considerable number of British Indians. Being the port on the mainland nearest the town of Zanzibar, 26 m. distant, Bagamoyo became the starting-point for caravans to the great lakes, and an entrepôt of trade with the interior of the continent. It possesses no natural harbour. The beach slopes gently down and ships anchor about 2 m. off the coast. The town is oriental in character. The buildings include the residence of the administrator, barracks, a government school for natives, a mosque and Hindu temple, and the establishment of the *Mission du Sauve Cœur*, which possesses a large plantation of coco-nut palms. Bagamoyo is in telegraphic communication with Zanzibar and with the other coast towns of German East Africa, and has regular steamship communication with Zanzibar. Of the explorers who made Bagamoyo the starting-point for their journeys to the interior of Africa, the most illustrious were Sir Richard Burton, J. H. Speke, J. A. Grant and Sir H. M. Stanley.

**Bagatelle** (French, from Ital. bagatella, bagata, a trifle), primarily a thing of trifling importance. The name, though French, is given to a game which is probably of English origin, though its connexion with the *shovel-board* of Cotton's *Complete Gamester* is very doubtful. Strutt does not mention it. The game is very likely a modification of billiards, and is played on an oblong board or table varying in size from 6 ft. by 1 ft. to 10 ft. by 3 ft. The bed of the table is generally made of slate, although, in the smaller sizes, wood covered with green cloth is often used. The sides are cushioned with India-rubber. The head is semi-circular and fitted with 9 numbered cups set into the bed, the number showing the amount scored by putting a ball into them. An ordinary billiard-cue and nine balls, one black, one white, four red and four white, are used. The black ball is placed upon a spot about 9 in. in front of hole 1, and about 18 in. from the player's end of the board a line (the baulek) is drawn across it; behind which is another spot for the player's ball. (These measurements of course differ according to the size of the table.) Some modern tables have pockets as well as cups.

**Bagatelle Proper.**—The black ball having been placed on the upper spot, the players' *strung* for the lead, the winner being that player who plays his ball into the highest hole. Any number may play, either separately, or in sides. Each player in turn plays all eight balls up the table, no score being allowed until a ball has touched the black ball, the object being to play as many balls as possible into the holes, the black ball counting double. Balls missing the black at the beginning, those rolling back across the baulek-line, and those forced off the table are "dead" for that round and removed. The game is decided by the aggregate score made in an agreed number of rounds.

**Sons Égal.**—This is a French form of the game. Two players take part, one using the red and one the white balls. After stringing for lead, the leader plays at the black, forfeiting a ball if he misses. His opponent then plays at the black if it has not been touched, otherwise any way he likes, and each then plays alternately, the object being to hole the black and his own balls, the winner being the one who scores the highest number of points. If a player holes one of his opponent's balls it is scored for his opponent. The game is decided by a certain number of rounds, or by points, usually 21 or 31. In other matters the rules of bagatelle apply.

**The Cannon Game.**—This is usually considered the best and most scientific of bagatelle varieties. Tables without cups are sometimes used. As in billiards three balls are required, the white, spot-white and black, the last being spotted and the non-striker's ball placed midway between holes 1 and 9. The object of the game is to make cannons (camos), balls played into holes, at the same time counting the number of the holes, but if a ball falls into a hole during a play in which no cannon is made the score counts for the adversary. If the striker's ball is holed he plays from baulek; if an object-ball, it is spotted as at the beginning of the game. A cannon counts by missing the white object-ball scores 1 to the adversary; missing the black, 5 to the adversary. If there are pockets, the striker scores 2 for holing the white object-ball and 3 for holing the black, but a cannon must be made by the same stroke; otherwise the score counts for the adversary.

**The Irish Cannon Game.**—The rules of the cannon game apply, except that in all cases pocketed balls count for the adversary.

**Mississippi.**—This variation is played with a bridge pierced with 9 more arches, according to the size of the table, the arches being numbered from 1 upwards. All nine balls are usually played, though the black is sometimes omitted, each player having a round, the object being to send the balls through the arches. This may not be done directly, but the bells must strike a cushion first, the black, if used, counting double the arch made. If a ball is played through an arch without first striking a cushion, the score goes to the adversary, but another ball, lying in front of the bridge, may be sent through by the cue-ball if the latter has struck a cushion. If a ball falls into a cup the striker scores the value of the cup as well as of the arch.

**Trou Madame.**—This is a game similar to Mississippi, with the exceptions that the ball need not be played on to a cushion, and that, if a ball falls into a cup, the opponent scores the value of the cup and not the striker.

**Bell-Bagatelle** is played on a board provided with cups, arches from which balls hang, and stalls each marked with a number. The ball is played up the side and rolls down the board, which is slightly inclined, through the arches or into a cup or stall, the winner scoring the highest with a certain number of balls.

**Bagdad** or **Bagdad**, a vilayet of Asiatic Turkey, situated between Persia and the Syrian desert, and including the greater part of the Tigris and Euphrates. The original vilayet extended from Mardin on the N. to the Persian Gulf on the S., and from the river Khabor on the W. to the Persian frontier on the E. From the middle of the 17th century, when this region was annexed by the Turks, until about the middle of the 19th century, the vilayet of Bagdad was the largest province of the Turkish empire, constituting at times an almost independent principality. Since then, however, it has lost much of its importance and all of its independence. The first reduction in size occurred in 1857, when some of the western portion of the vilayet was added to the newly created sanjak of Zor. In 1878 the Mosul vilayet was created out of its northern, and in 1884, the Basra vilayet out of its southern sanjaks. At the present time it extends from a point just below Kut el-Amara to a point somewhat above Tekrit on the Tigris, and from a point somewhat below Samawa to a point a little above Anah on the Euphrates. It is still, territorially, the largest province of the empire, and is inhabited by some of the most fertile lands in the Euphrates-Tigris valleys; but while possessing great possibilities for fertility, by far the larger portion of the vilayet is to-day a desert, owing to the neglect of the irrigation canals on which the fertility of the valley depends. From the latitude of Bagdad northward the region between the two rivers is an arid, waterless, limestone steppe, inhabited only by roving Arabs. From the latitude of Bagdad southward the country is entirely alluvial soil, deposited by the rivers Tigris and Euphrates, possessing great possibilities of fertility, but absolutely flat and subject to inundations at the time of flood of the two rivers. At that season much of the country, including the immediate surroundings of Bagdad, is under water. During the rest of the year a large part of the country is a parched and barren desert, and much of the remainder swamps and lagoons. Wherever there is any precipitate at all, irrigation, along the banks of the two great rivers and by the wells and springs which are in existence, the yield is enormous, and the shores of the Tigris and Euphrates in the neighbourhood of Bagdad and Hilla seem to be one great palm garden. Sultan Abd-ul-Hamid II. personally acquired large tracts of land in various parts of the vilayet. These so-called *vassal farms* are
well farmed and managed, in conspicuous contrast with the surrounding territory. Canals and dikes have been constructed to control and distribute the much-needed water, and the officials are housed in new buildings of substantial appearance. Indeed, wherever one finds a new and prosperous-looking village, it may be assumed to belong to the sultan. These sennichs are an advantage to the country in that they give security to their immediate region and certain employment to some part of its population. On the other hand, they withdrew large tracts of fertile and productive land from taxation (one-half of the cultivated land of the vilayet was said to be administered for the sultan's privy purse), and thus greatly reduced the revenue of the vilayet.

The chief city of the vilayet is its capital, Bagdad. Between the Euphrates and the Arabian plateau lie the sacred cities of Kerbela or Meshed-Hosain, and Nejef or Meshed Ali, with a population of 20,000 to 60,000 each, while a number of towns, varying in population from 3000 to 10,000, are found along the Euphrates (Anah, Hit, Ramadieh, Musseyyib, Hilla, Diwaneh and Samawa) and the Tigris (Tektit, Samara and Kut el-'Amara). The settled population lies entirely along the banks of these streams and the canals and the country between the banks of the Euphrates, between the Euphrates and the Tigris and between the latter and the Persian mountains, are tribes of wandering Arabs, some of whom possess great herds of horses, sheep, goats, asses and camels, while in and by the marshes other tribes, in the transition stage from the nomadic to the settled life, own great herds of buffaloes. Of the wandering Arab tribes, the most powerful is the tribe of Shammar, which ranges over all Mesopotamia. In January and February they descend as low as the neighbourhood of Diwaneh in such numbers that even Bagdad is afraid. Here and there are regions occupied by a semi-sedentary population, called Medan, occupying reed huts huddled around mud castles, called mejmul. These, like the Bedouin Arabs, are practically independent, waging constant warfare among themselves and paying an uncertain tribute to the Turkish government. In general, Turkish rule is confined to the villages, towns and cities along the river-banks, in which garrisons are located. Since the time (1868-1872) of Midhat Pasha, who did much to bring the independent Arab tribes under control, the Turkish government has been, however, gradually strengthening its grip on the country and extending the area of conscription and taxation. But from both the racial and religious standpoint, the Arab and Persian Shi'as, who constitute the vast bulk of the population, regard the Turks as foreigners and tyrants.

Of crops the vilayet produces wheat (which is indigenous), rice, barley (which takes the place of oats as food for horses), durra (a coarse, maize-like grain), sesame, cotton and tobacco; of fruits, the date, orange, lemon, fig, banana and pomegranate. The country is naturally treeless, except for the tamarisk, which grows by the swamps and along the river-beds. Here and there one sees a solitary silfat tree, or a small plantation of poplars or white mulberries, which, with the date-palm, constitute the only timber of the country. The willows reported by some travellers to be a variety of a narrow-leaved variety of poplar.

Besides the buffaloes and a few Indian oxen, there are no cattle in the country. Of wild animals, the jackal, antelope and hare are extremely numerous; lions are still found, and wolves and foxes are not uncommon. Snipe and various species of wild fowl are found in the marshes, and pelicans and storks abound along the banks of the Euphrates and Tigris. Fish are caught in great numbers in the rivers and marshes, chiefly barbel and carp, and the latter attain a great size that one is a sufficient load for an ass. The principal exports of the province are coarse wool, hides, dates and horses. At various points, especially at Hit, and from Hit southward along the edge of the Arabian plateau occur bitumen, naphtha and white petroleum springs, all of which remain undeveloped. The climate is very hot in summer, with a mean temperature of 97° F. From April to November no rain falls; in November the rains commence, and during the winter the thermometer falls to 46° F.

Cholera is endemic in some parts of the vilayet, and before 1875 the same was true of the bubonic plague. At that date this disease was stamped out by energetic measures on the part of the government, but it has reappeared again in recent years, introduced apparently from India or Persia by pilgrims. There are four great centres of pilgrimage for Shi'ite Moslems in the vilayet, Samarra, Kazemain, a suburb of Bagdad, Kerbela and Nejef. They are visited annually by tens of thousands of pilgrims, not only from the surrounding regions, but also from Persia and India; many of whom bring their dead to be buried in the neighbourhood of the sacred tombs.

Unpleasant, but not dangerous, is another disease, the so-called "Bagdad date-mark," known elsewhere as the "Aleppo button," &c. This disease extends along the rivers Tigris and Euphrates, and the country adjacent from Aleppo and Diarbekr to the Persian Gulf, although there are individual towns and regions in this territory which seem to be exempt. It shows itself as a boil, attacking the face and extremities. It appears in two forms, known to the natives as male and female respectively. The former is a dry scaly sore, and the latter a running, open boil. It is not painful but leaves ugly scars. The natives all carry a large supply of oil and old clothing to cover these scars of these boils which they have had as children. European children born in the country are apt to be seriously disfigured, as in their case the boils almost invariably appear on the face, and whereas native children have a rule but one boil, these born of European parents will have several. Adult foreigners visiting the country are also liable to be attacked, and women, especially, rarely escape disguise if they stay in the country for any length of time. The boils last for about a year, after which there is no more likelihood of a recurrence of the trouble than in the case of smallpox.

The area of the vilayet is 54,480 sq. m. The population is estimated at 832,000; Christians, 8000, principally Nestorians or Chaldaeans; Jews, 54,000; Moslems, 790,000, of whom the larger part are Shii's.

See G. Le Strange, Bagdad under the Abbasid Caliphate (1901); The Lands of the Eastern Caliphate (Cambridge, 1905); V. Cuinet, La Turquie d'Asie (Paris, 1890); J. P. Peters, Nippur (New York and London, 1897); Ed. Sachau, Am Euphrat und Tigris (Leipzig, 1900); A. V. Geere, By Nile and Euphrates (Edinburgh, 1915).

BAGDAD, or BAGDIAD, the capital of the Turkish vilayet of the same name. It is the headquarters of the VI. Army Corps, which garrisons also the Basra and Mosul vilayets. It lies on both sides of the river Tigris, in an extensive desert plain which has scarcely a tree or village throughout its whole extent, in latitude 33° 20' N., longitude 44° 24' E. At this point the Tigris and the Euphrates approach each other most nearly, the distance between them being little more than 25 m. At this point also the two rivers are connected by a canal, the northernmost of a series of canals which formerly united the two great waterways, and at the same time irrigated the intervening plain. This canal, the Sakhlawieh (formerly Isa), leaves the Euphrates a few miles above Fesuja and the bridge of boats, near the ruins of the ancient Anbar. As it approaches Bagdad it spreads out in a great marsh, and finally, through the Masudi canal, which encircles western Bagdad, enters the Tigris below the town. At the time of Chesney's survey of the Euphrates in 1804 this canal was still navigable for craft of some size. At present it serves no other purpose than to increase the floods which periodically turn Bagdad into an island city, and sometimes threaten to overwhelm the dikes which protect it and to submerge it entirely.

The original city of Bagdad was built on the western bank of the Tigris, but this is now, and has been for centuries, little more than a suburb of the larger and more important city on the eastern shore, the former containing an area of only 146 acres within the walls, while the latter extends over 591 acres. Both the eastern and the western part of the city were formerly enclosed by brick walls, with large round towers at the principal angles and smaller towers intervening at shorter distances, the whole surrounded by a deep fosse. There were three gates in the
western city and four in the eastern; one of the latter, however, on the north side, called "Gate of the Talisman" from an Arabic inscription bearing the date A.D. 1220, has remained closed since the capture of the city by Murad IV. in 1658. These walls all fell into decay long since; at places they were used as brick quarries, and finally the great reforming governor, (1868-1872), Midhat Pasha, following the example set by many European cities, undertook to destroy them altogether and utilize the free space thus obtained as a public park and esplanade. His plans were only partially carried out. At present fragments of the walls exist here and there, with the great ditch about them, while elsewhere a line of mounds marks their course. A great portion of the ground within the wall lines is not occupied by buildings, especially in the north-western quarter; and even in the more populous parts of the city, near the river, a considerable space between the houses is occupied by gardens, where pomegranates, figs, oranges, lemons and date-palms grow in great abundance, so that the city, when seen at a distance, has the appearance of rising out of the midst of trees.

Along the Tigris the city spreads out into suburbs, the most important of which is Kasemain, on the western side of the river. The houses there stand on pegs, and the district is called Muizzam. The former of these is connected with western Bagdad by a very primitive horse-tramway, also a relic of Midhat Pasha's reforms.

The two parts of the city are joined by pontoon bridges, one in the suburbs and one in the main city. The Tigris is at this point some 275 yds. wide and very deep. Its banks are of mud, with no other retaining walls than those formed by the foundations of the houses, which are consequently always liable to be undermined by the action of the water. The western part of the city, which is very irregular in shape, is occupied entirely by the Shi'as. It has its own shops, bazaars, mosques, &c., and constitutes a quarter by itself. Beyond the wall line on that side vestiges of ancient buildings are visible in various directions, and the plain is strewn with fragments of bricks, tiles and rubbish. A burying-ground has also extended itself over a large tract of land, formerly occupied by the streets of the city. The form of the new or eastern city is that of an irregular oblong, about 1500 paces in length by 800 in breadth. The town has been built without the slightest regard to regularity; the streets are even more intricate and winding than those in most other Eastern towns, and with the exception of the bazaars and some open squares, the interior is little else than a labyrinth of alleys and passages. The streets are unpaved and in many places so narrow that two horsemen can scarcely pass each other; as it is seldom that the houses have windows facing the thoroughfares, and the doors are small and mean, they present on both sides the gloomy appearance of dead walls. All the buildings, both public and private, are constructed of furnace-burnt bricks of a yellowish-red colour, principally derived from the ruins of other places, chiefly Madain (Ctesiphon), Wast and Babylon, which have been plundered at various times to furnish materials for the construction of Bagdad.

The houses of the richer classes are regularly built about an interior court. The ground floor, except for the serdab, is given over to kitchens, store-rooms, servants' quarters, stables. The usual rooms are on the first floor and open directly from a covered veranda, which is reached by an open staircase from the court. These constitute the winter residence of the family, reception rooms, &c. The roofs of the houses are all flat, surrounded by parapets of sufficient height to protect them from the observation of the dwellers opposite, and separate them from their neighbours. In the summer the population sleeps and dines upon the roofs, which thus constitute to all intents a third storey. The remainder of the day, so far as family life is concerned, is spent in the serdab, a cellar sunk somewhat below the level of the courtyard, damp from frequent wettings, with its half windows covered with hurdles thatched with camel thorn and kept dripping with water. Occasionally the serdabs are provided with punkahs.

Sometimes, in the months of June, July and August, when the sherki or south wind is blowing, the thermometer at break of day is known to stand at 112° F., while at noon it rises to 119° and a little before two o'clock to 122°, standing at sunset at 114°, but this scale of temperature is exceptional. Ordinarily during the summer months the thermometer averages from about 75° at sunrise to 107° at the hottest time of the day. Owing to the extreme dryness of the atmosphere and the fact that there is always a breeze, usually from the N.W., this heat is felt much less than a greater lower temperature in a more humid atmosphere. Moreover, the nights are almost invariably cool.

Formerly Bagdad was intersected by innumerable canals and aqueducts which carried the water of both the Euphrates and the Tigris through the streets and into the houses. To-day these have all vanished, with the exception of one aqueduct which still conveys the water of the Tigris to the shrine of Abd al-Qadir (ul-Kadil). The present population draws its water directly from the Tigris, and it is distributed through the city in goat-skins carried on the backs of men and asses. There is, of course, no sewerage system, the surfaces of the streets serving that purpose, and what garbage and refuse is not consumed by the dog scavengers washes down into the Tigris at the same place where the water for drinking is drawn. As a consequence of these insanitary conditions the death-rate is very high, and in case of epidemics the mortality is enormous. At such times a large part of the population leaves the city and encamps in the desert northward.

The principal public buildings of the city, such as they are, lie in the eastern section along the river bank. To the north, just within the old wall line, stands the citadel, surrounded by a high wall, with a lofty clock-tower which commands an excellent view. To the south of this, also on the Tigris, is the serai or palace of the Turkish governor, distinguished rather for extent than grandeur. It is comparatively modern, built at different periods, a large and confused structure without proportion, beauty or strength. Somewhat farther southward, just below the pontoon bridge, stands the custom house, which occupies the site and is built out of the material of the medresch or college of Mostansir (A.D. 1233). Of the original building of the caliph Mostansir all that remains is a minaret and a small portion of the outer walls. Farther down are the imposing buildings of the British residency. The German consulate also is on the river-front. As in all Mahomedan cities, the mosques are conspicuous objects. Of these very few are old. The Marjaniieh mosque, not far from the minaret of Mostansir, although its body is modern, has some remains of old and very rich arabesque work on its surface, dating from the 14th century. The door is formed by a lofty arch of the pointed form guarded on both sides with red bands exquisitely sculptured and having numerous inscriptions. The mosque of Khasaki, supposed to have been an old Christian church, is chiefly distinguished for its prayer niche, which, instead of being a simple recess, is crowned by a Roman arch, with square pedestals, spirally fluted shafts and a rich capital of flowers, with a fine fan or shell-top in the Roman style. The building in its present form bears the date of A.D. 1682, but the sculptures which it contains belong probably to the time of the caliphate. The minaret of Suk-el-Ghazl, in the south-eastern part of the city, dates from the 13th century. The other mosques, of which there are about thirty within the walls, excluding the chapels and places of prayer, are all of recent erection. Most of them are surmounted by bright-coloured cupolas and minarets. The Mosque of the Vizier, on the eastern side of the Tigris, near the pontoon bridge, has a fine dome and a lofty minaret, and the Great Mosque in the square of el Meidan, in the neighbourhood of the serai, is also a noble building.

The other mosques do not merit any particular attention, and in general it may be said that Bagdad architecture is neither distinctive nor imposing. Such attractions as the buildings possess are due rather to the richly coloured tiles with which many of them are adorned, or to inscriptions, like the Kufic inscription, dated A.D. 944, on the ruined lekke of the Bektash dervishes in western Bagdad. More important than the mosques
proper are the tomb mosques. Of these, the most important and most imposing is that of Kazemain, in the northern suburb of the western city. Here are buried the seventh and ninth of the successors of Ali, recognized by Shi'as, namely Musa Ib'n Ja'far el-Kazim, and his grandson, Mahomed Ib'n Ali el-Jawad. In its present form this mosque dates from the 10th century. The two great domes above the tombs, the four lofty minarets and part of the façade of this shrine, are overlaid with gold, and from whatever direction the traveler approaches Bagdad, its glittering domes and minarets are the first objects which meet his eye. It is one of the four great shrines of the Shi'ite Moslems in the vilayet of Bagdad. Christians are not allowed to enter its precincts, and the population of the Kazemain quarter is fanatical that it is difficult and even dangerous to approach it.

In the suburb of Muazzam, on the western side of the river, is the tomb of Abū Ḥanīfa (q.v.), the canon lawyer. There is a large mosque with a painted dome connected with this tomb, which is an object of veneration to the Sunni Moslems, but it seems cheap and unworthy in comparison with the magnificent shrine of Kazemain. On the same side of the river, lower down, is the shrine of Abū al-Qadīr al-Jilāni (of Jilān), founder of the Qādirite (Kadariya) sect of dervishes, also a noted place of pilgrimage. The original tomb was erected about A.D. 1253, but the present fine dome above the grave is later by at least two or three centuries. The possessor or controller of this wealthy mosque is the nakib, locally pronounced nājeeb, or marshal of the nobles, whose office is to determine who are Se'ids, i.e. entitled to wear the green turban. He is second only to the governor or vali pasha in power, and indeed his influence is often greater than that of the official ruler of the vilayet. Just outside of the wall of the western city lies the tomb and shrine of Ma'ruf Karkhi, dating from A.D. 1215, which also is a place of pilgrimage. Close to this stands the so-called tomb of Sitte Zobeide (Zobaida), with its octagonal base and pilasters, is one of the most conspicuous and curious objects in the neighbourhood of Bagdad. Unfortunately it is rapidly falling into decay. K. Niebuhr reports that in his day (A.D. 1756) this tomb bore an inscription setting forth that Ayesha Khanum, the wife of the governor of Bagdad, was buried here in 1488, her grave having been made in the ancient sepulchre of the lady Zobeide (Zobaida), granddaughter of Caliph Mansur and wife of Harun al-Rashid, who died in A.D. 831. The tomb was restored at the time of her burial, at which date it was already ancient, and it was evidently believed to be the tomb of Zobeide. Contemporary historians, however, state that Zobeide was actually buried in Kazemain, and moreover, early writers, who describe the neighbouring tomb and shrine of Ma'ruf Karkhi, make no reference to this monument.

About 3 m. west of Bagdad, on the Euphrates road, in or by a grove of trees, stands the shrine and tomb of Nābi Yusha or Kohén Yusha, a place of monthly pilgrimage to the Jews, who believe it to be the place of sepulture of Jeshoah of Josoph, the high priest at the close of the exilian period. This is one of four similar Jewish shrines in Irak; the others being the tomb of Ezra on the Shatt el-Arab near Korna, the tomb of Ezekiel in the village of Kefl near Kufa, and the well of Daniel near Hillah. This shrine is also venerated by Moslems, who call it the tomb of Yusuf (Joseph). The Jews bury here their chief priests, a right the Moslems at times contest, and in 1889 a serious conflict between Jews and Moslems resulted from an attempt of the former to exercise this right.

There are said to be about thirty khans or caravanserais in Bagdad for the reception of pilgrims and merchants and their goods, none of which is of any importance as a building, with the single exception of the khan el-Aurtemeh adjoining the Marjanich mosque, to which it formerly belonged. This dates from A.D. 1356, and is said to occupy the site of an ancient Christian church. Its vaulted roof is a fine specimen of Saracenic brickwork. In recent years the demands of modern travel have led to the establishment of a hotel, which affords comfortably accommodation according to European methods. There is also an English club-house. There are said to be about fifty baths in Bagdad, but in general they are inferior in construction and accommodation. The bazaars of Bagdad are extensive and well stocked, and while not so fine in construction as those of some other Eastern cities, they are more interesting in their contents and industries, because Bagdad has on the whole been less affected by foreign innovations. Several of the bazaars are vaulted over with brickwork, but the greater number are merely covered with flat beams which support roofs of dried leaves or branches of trees and grass. The streets of the entire business section of the city are roofed over in this manner, and in the summer months the shelter from the sun is very grateful, but in the winter these streets are extremely trying to the foreign visitor, owing to their darkness and their damp and chilly atmosphere.

Bagdad is about 500 m. from the Persian Gulf, following the course of the river. It maintains steam communication with Basra, its port, which is situated on the Shatt el-Arab, somewhat more than 50 m. from the Persian Gulf, by means of two lines of steamers, one English and one Turkish. British steamers were first placed upon the Tigris as a result of the expedition of Colonel F. R. Chesney, in 1836. Since that time a British gun-boat has been stationed before the residency, and British steamers have been allowed to navigate the river. Only two of these, however, maintain a weekly connexion with Basra, and they are quite inadequate to the freight traffic between the two cities. The more numerous vessels of the Turkish service are so small, so inadequately equipped and so poorly handled, that they are used for either passenger or freight transport only by those who cannot secure the services of the British steamers. The navigation of the Tigris during the greater part of its course from Bagdad to Korna is slow and uncertain. The river, running through an absolutely flat country, composed entirely of alluvial soil, is apt to change its channel. In flood time the country at places becomes a huge lake, through which it is extremely difficult to find the channel. In the dry season, the autumn and winter, on the other hand, there is danger of grounding on the constantly shifting flats and shoals. To add to the uncertainties of navigation, the inhabitants along the eastern bank of the stream frequently dig new canals for irrigation purposes, which both reduces the water of the river and tends to make it shift its channel. Above Bagdad there are no steamers on the Tigris, but sailing vessels of 30 tons and more navigate the river to Samarra and beyond. The characteristic craft for local service in the immediate environment of Bagdad is the kūfā, a circular boat of basket-work covered with bitumen, often of a size sufficient to carry five or six horses and a dozen men. These boats have been employed from the remotest antiquity through all this region, and are often depicted on the old Assyrian monuments. Equaly ancient are the rafts called kelēk, constructed of inflated goat-skins, covered with a framework of wood, often supporting a small house for passengers, which descend the Tigris from above Diarbekr. The wood of these rafts is sold in Bagdad, and constitutes, in fact, the chief supply of wood in the neighbourhood.

Bagdad also lies on a natural line of communication between Persia and the west, the ancient caravan route from Khorsaran debouching from the mountains at this point, while another natural caravan route led up the Euphrates to Syria and the Mediterranean and still another up the Tigris to Armenia and the Black Sea. It was its situation at the centre of the lines of communication between India and Persia and the west, both by land and water, which gave the city its great importance in early times. With the change of the methods of transportation, its importance has naturally declined. The trade of Persia with the west now passes either through the ports of the Persian Gulf or northward over Trebizond, while India communicates with the west directly through the Suez Canal. Bagdad is, therefore, a decayed city. Money is scarce among all classes, and the wages of common labourers are scarcely half what is paid in Syria. It is still, however, the centre of distribution for a very large, if scantly populated, country, and it also derives much profit from pilgrims, lying as it does on the route which Shi'ite
The staple articles of export are hides, wool and dates. The export trade of Bagdad amounts to about £750,000 annually, and the import trade to about £2,000,000. The imports consist of oil, cheap cottons, shoes and other similar goods, which are taking the place of the picturesque native manufactures. Even the Bedouin Arabs wear headdresses of cheap European cotton stuff purchased in Bagdad or thereabouts, while the common water vessels throughout the country are five-gallon petroleum tins, which also furnish metal for the manufacture of various utensils in the native bazaars.

Bagdad is in communication with Europe by means of two lines of telegraph, one British and one Turkish, and two postal services. There is a British consul-general, who is also political agent to the Indian government. His state is second only to that of the British ambassador at Constantinople. Besides the gunboat in the river, he has a guard of sepoys, and there is an Indian post-office in Bagdad. Formerly the British government maintained a camel-post across the desert to Damascus. This was abandoned about 1880 when the Turks established a similar service. By means of the Turkish camel-post letters reached Damascus in nine days. There is also a Russian consul-general at Bagdad, and French, Austrian and American consuls.

The Euphrates Valley (or Bagdad) railway scheme, which had previously been discussed, was brought forward prominently in 1899, and Russian proposals to undertake it were rejected. British proposals followed, but were opposed by the Germans, who, as controlling the line to Konia in Asia Minor, claimed preference in the matter. A provisional convention was granted to a German company by the Porte, and an irádé was obtained in 1902. In 1903 there was considerable discussion as to the placing of the line under international control, and the question aroused special interest in England in view of the short route which the line would provide to India, in connexion with fast steamship services in the Mediterranean and the Persian Gulf. It was decided by the British government that the proposals made to this effect did not offer sufficient security. The financial arrangement as finally agreed upon was that German financiers should control 40% of the capital of the line: French (through the Imperial Ottoman Bank), 30%; Austrian, Swiss, Italian and Turkish, 20%; and the Anatolian Railway Company, 10%. In 1904 the line was completed from Konia through Eregli to Bulghuri. In 1908 an irádé sanctioned the extension across the Taurus to Adana, and so to Helfi near Mardin (222 m.).

The population of Bagdad is estimated variously from 70,000 to 200,000; perhaps halfway between may represent approximately the reality. More than two-thirds of the population are Moslems, mostly Shi'a, with the exception of the official classes. There are about 34,000 Jews occupying a quarter of their own in the north-western part of the city; while in a neighbouring quarter dwell upwards of 6000 Christians, chiefly so-called Chaldaean or Nestorians. The Carmelites maintain a mission in Bagdad, as does also the (English) Church Missionary Society. The Jews are the only part of the population who are provided with schools. A school for boys was established by the Alliance Israélite in 1865, and one for girls in 1890. Besides these, there is also an apprentice school for industrial training.

The Jews constitute the wealthiest and most intelligent portion of the population. A large part of the foreign trade is in their hands, and at the season of the sheep-selling their agents and representatives are found everywhere among the Bedouins and Mazda'An Arabs of the interior, purchasing the wool and selling various commodities in return. They are the bankers of the country, and it is through their communications that the traveller is able to obtain credit. They are also the dealers in antiquities, both genuine and fraudulent. Next to them in enterprise and prosperity are the Christians. The quarters of the Greeks are all Kurdish, the river-men Chaldaean Christians. Every nation retains its peculiar dress. The characteristic, but by no means attractive, street dress of the Moslem women of the better class comprises a black horse-hair visor completely covering the face and projecting like an enormous beak, the nether extremities being encased in yellow boots reaching to the knee and fully displayed by the method of draping the garments in front. Bagdad is governed by a pasha, assisted by a council. The pasha and the higher officials in general come from Constantinople, but a very large portion of the other Turkish officials seem to come from the town of Kerkuk. They constitute a class quite distinct from the native Arab population, and they and the Turkish government in general are intensely unpopular among the Arabs, an unpopularity increased by their religious differences, the Arabs being as a rule Shi'ites, the Turks Sunnites. Besides the court of superior officers, which assists the pasha in the general administration of the province, there is also a mejlis or mixed tribunal for the settlement of municipal and commercial affairs, to which both Christian and Jewish merchants are admitted. Besides these, there are the religious heads of the community, especially the nakib and Jewish high priest, who possess an undefined and extensive authority in their own communities.

The Jewish chief priest may be said to be the successor of the exilarch or rehsh golaitha of the earlier period.

History.—There are in or near Bagdad a few remains of a period antedating Islam, the most conspicuous of which are the ruins of the palace of Chosroes at Ctesiphon or Madain, about 15 m. below Bagdad on the east side of the river. Almost equally conspicuous, and a landmark through the whole region, is the ruin called Akeruf, in the desert, about 9 m. westward of Bagdad. This consists of a huge tower of unburned brick resting on a small hill of debris, the whole rising to a height of 100 ft. or more above the plain, in the centre of a network of ancient canals. Inscribed bricks found in the neighbourhood seem to connect this ruin with Kurigalzu, king of Babylon about 1300 B.C. Under substantially its present name, Akukafa, it is mentioned as a place of importance in connexion with the canals as late as the Abbasid caliphate. Within the limits of the city itself, on the west bank of the Tigris, are the remains of a quay, first observed by Sir Henry Rawlinson, at a period of low water, in 1849, built of bricks laid in bitumen, and bearing an inscription of Nebuchadrezzar, king of Babylon. Baghadu was an ancient Babylonian city, dating back perhaps as far as 2000 B.C., the name occurring in lists in the library of Assur-bani-pal. It is also mentioned on the Micaux stone, found on the Tigris near the site of the present city, and dating from the time of Tiglath-Pileser I. (1100 B.C.). The quay of Nebuchadrezzar, mentioned above, establishes the fact that this ancient city of Baghadu was located on the site of western or old Bagdad (see further under CALIPHATE; Abbasids, sections 2 foll.). References in the Jewish Talmud show that this city still continued to exist at and after the commencement of our era; but according to Arabian writers, at the time when the Arab city of Bagdad was founded by the caliph Mansur, there was nothing on that site except an old convent. One may venture to doubt the literal accuracy of this statement. It is clear that the ancient name, at least, still held firm possession of the site and was hence inherited by the new city.

The Arab city, the old or round city of Bagdad, was founded by the caliph Mansur of the Abbasid dynasty on the west side of the Tigris just north of the Isá canal in a.d. 762. It was a mile in diameter, built in concentric circles, with the mosque and palace of the caliph in the centre, and had four gates toward the four points of the compass. It grew with great rapidity. The suburb of Rusafa, on the eastern bank, sprang up almost immediately, and after the siege and capture of the round city by the army, in 814, this became the most important part of the capital. The period of the greatest prosperity of Bagdad was the period from its foundation until the death of Mansun, the
successor of Harun, in 833. During this period the city, including both sides of the river, was 5 m. across within the walls, and it is said to have had a population of 2,000,000 souls. In literature, art and science, it divided the supremacy of the world with Cordova; in commerce and wealth it far surpassed that city. How its splendour impressed the imagination may be seen from the stories of the Arabian Nights. It was the religious capital of all Islam, and the political capital of the greater part of it, at a time when Islam bore the same relation to civilization which Christendom does to-day. As in Spanish Islam, so in the lands of the eastern caliphate, the Jews were treated relatively with favour. The seat of the exilarch or rehsh galutha was transferred from Pumbedita (Pumbeditha or Pumbedita) in Babylonia to Bagdad, which thus became the capital of oriental Judaism; from then to the present day the Jews have played no mean part in Bagdad.

Situated in a region where there is no stone, and practically no timber, Bagdad was built, like all the cities of the Babylonian plain, of brick and tiles. Its buildings depended for their effect principally on mass and gorgeous colouring. Like old Babylon, also, Bagdad was celebrated throughout the world for its brilliantly coloured textile fabrics. So famous was the silk of Bagdad, manufactured in the Attabieh quarter (named after Attab, a contemporary of the Prophet), that it was used as a name of personal and commercial honour until it was finally and finally into English in the form of "tabby," as the designation of a rich-coloured watered silk. Depending on coloured tiles and gorgeous fabrics for their rich effects, nothing of the buildings of the times of Harun al-Rashid or Mamun, once counted so magnificent, have come down to us. All have perished in the numerous sieges and inundations which have devastated the city.

With the rise of the Turkish body-guard under Mamun's successor, Mo'tassim, began the downfall of the Abbasid dynasty, and with it of the Abbasid capital, Bagdad. Mo'tassim founded Samarra, and for fifty-eight years caliph and court deserted Bagdad (see Caliphate, sect. C). Then, in A.D. 865, Mosta'in, attempting to escape from the tyranny of the Turkish guard, fled back again to Bagdad. The attempt was futile, Bagdad was besieged and taken, and from that time until their final downfall the Abbasid caliphs were mere puppets, while the real rulers were successively the Turkish guard, the Buyids and the Seljuks. But during all this period the caliphs continued to be the religious heads of Islam and their residence its capital. Bagdad, accordingly, remained as the chief city, the first rank, and during most of that period the richest and most splendid city in the world. Its religious importance is attested by the number of its great shrines dating from those times; for its wealth and size, while, as stated above, few remains of the actual buildings of that period survive, we still have abundant records describing their character, their size and their position. With the last century of the caliphatse began a more rapid decline. From the records of that period it seems that the present city is identical in the position of its walls and the space occupied by the town proper with Bagdad at the close of the 12th century, the period when this rapid decline had already advanced so far that the western city is described by travellers as almost in ruins, and the eastern half as containing large uninhabited spaces. With the capture of the city by the Mongols, under Hulagu (Hulaku), the grandson of Genghis Khan, in 1258, and the extinction of the Abbasid caliphate of Bagdad, its importance as the religious centre of Islam passed away, and it ceased to be a city of the first rank, although the glamour of its former greatness is still clinging to it; so that even to-day in Turkish official documents it is called the "glorious city."

The Tatars retained possession of Bagdad for a century and a half, until about A.D. 1400. Then it was taken by Timur, from whom the sultan Ahmed Ben Avis fled, and, finding refuge with the Greek emperor, contrived later to repossess himself of the city, whence he was finally expelled by Kara Yusuf of the Kara-Kuyunli ("Black Sheep") Mongols in 1417. About 1468 the descendants of the latter were driven out by Uzun Hasan or Cassim of the Ak-Kuyunli ("White Sheep") Mongols. He and his descendants reigned in Bagdad until Shah Ismail I., the founder of the Safavid royal house of Persia, made himself master of the place (c. 1502 or 1508). From that time it continued for a long period an object of contention between the Turks and the Persians. It was taken by Suleiman I. the Magnificent and re-taken by Shah Abbas the Great, in 1620. Eighteen years later, in 1638, it was besieged by Sultan Murad IV., with an army of 300,000 men and, after an obstinate resistance, forced to surrender, when, in defiance of the terms of capitulation, most of the inhabitants were massacred.

Since that period it has remained nominally a part of the Turkish empire; but with the decline of Turkish power, and the general disintegration of the empire, in the first half of the 18th century, a then governor-general, Ahmed Pasha, made it an independent pashalic. Nadir Shah, the able and energetic usurper of the Persian throne, attempting to annex the province once more to Persia, besieged the city, but Ahmed defended it with such courage that the invader was compelled to raise the siege, after suffering great loss. Turkish authority over the pashalic was again restored in the first part of the 19th century.

BAGÉ, a town and municipality of the state of Rio Grande do Sul, Brazil, about 176 m. by rail W.N.W. of the city of Rio Grande do Sul. Pop. of the municipality (1890) 22,692. It is situated in a hilly region 774 ft. above sea-level, and is the commercial centre of a large district on the Uruguay border in which pastoral occupations are largely predominant. This region is the watershed for southern Rio Grande do Sul, from which streams flow E. and S.E. to the Atlantic coast, and N.W. and S.W. to the Uruguay river. The town dates from colonial times, and has always been considered a place of military importance because of its nearness to the Uruguay frontier, only 25 m. distant. It was captured by the Argentine general Lavalle in 1827, and figured conspicuously in most of the civil wars of Argentina. It is also much frequented by Uruguayan revolutionists.

BAGEHOT, EDMUND WILSON, the English publicist and economist, editor of the Economist newspaper from 1866 to his death, was born at Langport, Somerset, on the 3rd of February 1826, his father being a banker at that place. Bagehot was altogether a remarkable personality, his writings on different subjects exhibiting the same bent of mind and characteristics,—philosophic reflectiveness, practical common-sense, a bright and buoyant humour, brilliant wit and always a calm and tolerant judgment of men and things. Though he belonged to the Liberal party in politics he was essentially of conservative disposition, and often spoke with sarcastic boldness to his Liberal friends of the stupidity and tenacity of the English mind in adhering to old ways, as displayed in city and country alike. His life was comparatively uneventful, as he early gave up to literature the energies which might have gained him a large fortune in business or a great position in the political world. He took his degree at the London University in 1848, and was called to the bar in 1852, but from an early date he joined his father in the banking business of Stuckey & Co. in the west of England, and during a great part of his life, while he was editor of the Economist, went to the London University's Bank, lending its surplus money in "Lombard Street," and otherwise attending to its London affairs. He became also an underwriter at Lloyd's, taking no part, however, in the active detailed business, which was done for him by proxy.

Bagehot's connexion with the Economist began in 1858, about which time he married a daughter of the first editor, the Right Hon. James Wilson, at that time secretary of the treasury, and afterwards secretary of finance in India. Partly through this
connexion he was brought into the inside of the political life of the time. He was an intimate friend of Sir George Cornwall Lewis, and was afterwards in constant communication with many of the political chiefs, especially with Gladstone, Robert Lowe and Grant Duff, and with the permanent heads of the great departments of state. In the city in the same way he was intimate with the governor and directors of the Bank of England, and with leading magnates in the banking and commercial world; while his connexion with the Political Economy Club brought him into contact in another way with both city and politics. His active life in business and politics, however, was not of so absorbing a kind as to prevent his real devotion to literature, but the literature largely grew out of his activities, and of no one can it be said more truly than of Bagehot that the atmosphere in which he lived gave tone and colour and direction to his studies, one thing of course acting and reacting on another. The special note of his books, apart from his remarkable gift of conversational epigrammatic style, which gives a peculiar zest to the writing, is the quality of scientific dispassionate description of matters which were hardly thought of previously as subjects of scientific study. In his special connexion with the study of Administration he brought him the most reputation, The English Constitution (1867) and Lombard Street (1873). They are both books of observation and description. The English constitution is described, not from law books and as a lawyer would describe it, but from the actual working, as Bagehot himself had witnessed it, in his contact with ministers and the heads of government departments, and with the life of the society in which the politicians moved. The true springs and method of action are consequently described with a vivid freshness which gives the book a wonderful charm, and makes it really a new departure in the study of politics. It is the same with Lombard Street. The money market is there pictured as it really was in 1850-1870, and as Bagehot saw it with philosophic eyes. Beginning with the sentence, "The objects which you see in Lombard Street are the Bank of England, the joint stock banks, the private banks and the discount houses," he describes briefly and clearly the respective functions of these different bodies in the organism of the city, according to his own close observation as a banker himself, knowing the ways and thoughts of the men he describes, and a man of business likewise in other ways, knowing at first hand the relation of banking to the trade and commerce of the country. Lombard Street is perhaps a riper work than The English Constitution, as its foundation was really laid in 1858 in a series of articles which Bagehot then wrote in the Economist, though it was not published till the early 'seventies, after it had been twice rewritten and revised with infinite labour and care. Lombard Street, like The English Constitution in political studies, is thus a new departure in economic and financial studies, applying the same sort of keen observation which Adam Smith used in the analysis of business generally to the special business of banking and finance in the complex modern world. It is, perhaps, not going too far to say that the whole theory of a one-reserve system of banking and how to work it, and of the practical means of fixing an "apprehension minimum" below which the reserve should not fall, originated in Lombard Street and the articles which were the foundation of it; and the subsequent conduct of banking in England and throughout the world has been infinitely better and safer in consequence. A like note is also struck in Physics and Politics (1860), which is a description of the evolution of communities of men. The materials here are derived mainly from books, the surface to be observed being so extensive, but the attitude is precisely the same, that of a scientific observer. To a certain extent the Physics and Politics had even a more remarkable influence on opinion, at least on foreign opinion, than The English Constitution or Lombard Street. It "caught on" as a development of the theory of evolution in a new direction, and Darwin himself was greatly interested, while one of the pleasures of Bagehot's later years was to receive a translation of the book into the Russian language. In Literary Studies (1870) and Economic Studies (1880), published after his death, there is more scope than in the books already mentioned for other characteristics besides those of the scientific observer, but observation always comes to the front, as in the account of Ricardo, whom Bagehot describes as often, when he is most theoretical, really describing what a first-rate man of business would do and think in actual transactions. The observation, of course, is that of a type of business man in the city to which Ricardo as well as Bagehot belonged, though Ricardo could hardly look at it from the outside as Bagehot was able to do.

Bagehot had great city, political and literary influence, to which all his activities contributed, and much of his influence was lasting. In politics and economics especially his habit of scientific observation affected the tone of discussion, and both the English constitution and the money market have been better understood generally because he wrote and talked and diffused his ideas in every possible way. He was unsuccessful in two or three attempts to enter parliament, but he had the influence of far more than an ordinary member, as director of the Economist and as the adviser behind the scenes of the ministers and permanent heads of departments who consulted him. His death, on the 24th of March 1878, occurred at Langport very suddenly, and perhaps in the fullest mental vigour and might have looked forward to the accomplishment of much additional work and the exercise of even wider influence.

It is impossible to give a full idea of the brightness and life of Bagehot's conversation, although the conversational style of his writing may help those who did not know him personally to understand it. With winged words he would transfix a fallacy or stamp a true idea so that it could not be forgotten. He was certainly greater than his books and always full of ideas. The present writer recalls two notions he had, not for writing new books himself, but as something that might be done. One was that there might be a history of recent politics with new lights if some one were to do it who knew the family connexions and history of English politicians. This was apropos of the passage of a certain bill through parliament, when the head of the department in the House of Commons failed and the management of the measure was taken by the chancellor of the exchequer himself, a relative of the permanent head of the department concerned, who was thus able to carry his own ideas in legislation notwithstanding the failure of his political chief. Another book he wished to write would be "The differences in the administrative systems of England and Scotland, by which he had been greatly impressed, the differences not being in detail, but in fundamental idea and in form, so that no judicial or other officers in the one were represented in the other by corresponding functionaries. Many other illustrations might be given of his fulness of ideas which helped to make him an ideal editor. Reference must also be made to the assistance which Bagehot gave as a journalist to the study of statistics. From the manipulation of figures he was most averse, and he rather boasted that he was unable to add up. But he was a most excellent mathematician, and no one could be so careful as he was about the logic of the figures got together for his articles, which he always most carefully scrutinized. He would frequently point out that his figures were illustrative merely, and did not by themselves establish an argument. He was always anxious, again, to impress on those about him that a subject could not be studied with the help of figures and accounts alone.

Whether it was insurance, or banking, or underwriting, or shipowning, he insisted that some one who knew the business should see the writing before it was published. Knowing so many departments of business from actual experience, he was a host in himself as referee, but when in doubt he would always consult some one who knew the facts; and he used his great influence so well that in subsequent years it inspired indirectly not a few who were hardly aware of his claims to be a statistician at all.

(R. GN.)

BAGELKHAND, or Baghelkhand, a tract of country in central India, occupied by a collection of native states. The Bagelkhand agency is under the political superintendence of the governor-general's agent for central India, and under the direct jurisdiction of a political agent who is also superintendent.
of the Rewa state, residing ordinarily at Sutari or Rewa. The
agency consists of Rewa state and eleven minor states and
estates, of which the more important are Mahar, Nagode and
Sohawal. The total area is 14,323 sq. m., and the population
in 1901 was 1,555,024, showing a decrease of 1.1% in the decade,
due to the results of famine. The rainfall was very deficient
in 1895-1897, causing famine in 1897; and in 1899-1900 there
was drought in some sections. The agency was established in
March 1871. Until that date Bagelkhand was under the
Bundelkhand agency, with which it is geographically and
historically connected; a general description of the country
will be found under that heading. According to Wilson, in his
_Glossary of Indian Terms_, the Baghelas, who give their name
to this tract of country, are a branch of the Sisodyia Rajputs
who migrated eastward and once ruled in Gujarat.

**Baggara** (Cowherds), African “Arabs” of Semitic
origin, so called because they are great cattle owners and breeders.
They occupy the country west of the White Nile between the
Shilluk territory and Dar Nuba, being found principally in
Kordofan. They are true nomad Arabs, having intermarried
little with the Nuba, and have preserved most of their national
characteristics. The date of their arrival in the Sudan is un-
certain: they appear to have drifted up the Nile valley and
to have dispossessed the original Nuba population. A purely
pastoral people, they move from pasture to pasture, so food
becomes deficient. The true Baggara tribesmen employ oxen
as saddle and pack animals, carry no shield, and though many
possess firearms the customary weapons are lance and sword.
They have always had the reputation of being robust fighters.
Engaged from the earliest times in the slave trade, they were
among the first, as they were certainly the most fervent, sup-
porters of the mahdi when he rose in revolt against the Egyptians
(1882). They constituted his real fighting force, and to their
fanatical courage his victories were due. Their decision to
follow him out of their own country to Khartum brought about
the fall of that city. The mahdi’s successor, the khalifa Ab-
dullah, was a Baggara, and throughout his rule the tribe held
the first place in his favour. They have been described as
“men who look the fiends they really are—of most sinister
expression, with murder and every crime speaking from their
savage eyes. Courage is their only good quality.” They are
famous, too, as hunters of big game, attacking even elephants
with sword and spear. G. A. Schweinfurth declares them to
the best-looking of the Nile nomads, and the men are types of
physical beauty, with fine heads, erect athletic bodies and
sinewy limbs. There is little that is Semitic in their appearance.
Their skins vary in colour from a dark red-brown to a deep
black; but their features are regular and free of negro character-
istics. In mental power they are much superior to the indigenous
races around them. They have a passion for fine clothes and
ornaments, tricking themselves out with glass trinkets, rings
and articles of ivory and horn. Their mode of hair-dressing
(mop-fashion) earned them, in common with the Hadendon, the
title of “fuzzy-wuzzies” among the British soldiers in the
campaigns of 1884-88.

See G. A. Schweinfurth, _Heart of Africa_ (1874); Sir F. R. Wingate,
_Mahdiism and the Egyptian Sudan_ (1891). _Anglo-Egyptian Sudan_,
edited by Count Gleichen (1905); A. H. Keane, _Ethnology of the
Egyptian Sudan_ (1884).

**Baggesen, Jens Immanuel** (1764-1826), Danish poet,
was born on the 15th of February 1764 at Korsør. His parents
were very poor, and before he was twelve he was sent to copy
documents at the office of the clerk of the district. He was a
melancholy, feeble child, and before this he had attempted
suicide more than once. By dint of indomitable perseverance,
he managed to gain an education, and in 1782 entered the
university of Copenhagen. His success as a writer was coeval
with his earliest publication; his _Comical Tales_ in verse, poems
that recall the _Bread Grins_ that Colman the younger brought
out a decade later, took the town by storm, and the struggling
young poet found himself a popular favourite at twenty-one. He
then tried serious lyrical writing, and his tact, elegance of
manuer and versatility, gained him a place in the best society.
This sudden success received a blow in 1789, when a very poor
operatic, _Holge Danske_, which he had produced, was received
with mockery and a reaction against him set in. He left Denmark
in a rage and spent the next years in Germany, France and
Switzerland. He married at Bern in 1790, began to write in
German and published in that language his next poem, _Alpenkind_.
In the winter of the same year he returned to his mother-country,
bringing with him as a peace-offering his fine descriptive poem,
the _Labyrinth_, in Danish, and was received with unbounded
homage. The next twenty years were spent in incessant restless
wanderings over the north of Europe, Paris latterly becoming
his nominal home. He continued to publish volumes alternately
in Danish and German. Of the latter the most important was
the idyllic epos in hexameters called _Parthenais_ (1803). In
1806 he returned to Copenhagen to find the young Öhnsclüger
installed as the great poet of the day, and he himself beginning
to lose his previously unbounded popularity. Until 1820 he
resided in Copenhagen, in almost unceasing literary feud with
some one or other, abusing and being abused, the most important
feature of the whole being Baggesen’s determination not to
allow Öhnsclüger to be considered a greater poet than himself.
He then left Denmark for the last time and went back to his
beloved Paris, where he lost his second wife and youngest child
in 1822, and after the miseries of an imprisonment for debt,
fell at last into a state of hopeless melancholy madness. In
1826, having slightly recovered, he wished to see Denmark once
more, but died in the freemasons’ hospital at Hamburg on his
way, on the 3rd of October, and was buried at Kiel. His many-
sided talents achieved success in all forms of writing, but his
domestic, philosophical and critical works have long ceased to
occupy attention. A little more power of restraining his egotism
and passion would have made him one of the Wittiest and
keenest of modern satirists, and his comic poems are deathless.
The Danish literature owes Baggesen a great debt for the firm-
ness, polish and form which he introduced into it—his style
being always finished and elegant. With all his faults he stands
as the greatest figure between Holberg and Öhnsclüger. Of
all his poems, however, the loveliest and best is a little simple
song, _There was a time when I was very little_, which every
Dane, high or low, knows by heart, and which is matchless in
its simplicity and pathos. It has outlived all his epics. (E.G.)

**Bagging**, the name given to the textile stuff used for making
bags (see also _Sacking_ and _Tarboulin_). The material used
was originally Baltic hemp, while in the beginning of the 19th
century Sunn hemp or India hemp was also employed. Modern
requirements call for so many different types of bagging that
it is not surprising to find all kinds of fibres used for this purpose.
Most bagging is now made from yarns of the jute fibre.
The cloth is, in general, woven with the plain weave, and the warp
threads run in pairs, but large quantities of bags are made from
cloths with single warp threads. In both cases the weave used for
the cloth is shown in the figure, but when double threads of
warp are used, the arrangement is equivalent to the weave shown at B.
The interlacings of the two sets of warp and weft for single and
double warp are shown respectively at C and D, the
black marks indicating the warp threads, and the white or
blanks showing the weft. The particular style of bagging
depends, naturally, upon the kind of material it is intended to hold.
The coarsest type of bagging is perhaps that known as
“cotton bagging,” which derives its name from the fact that it is
used in the manufacture of bags for transporting raw cotton from
the United States of America. It is a heavy fabric 42 in.
wide, and weighs from 2 to 4 lb per yard. A similar, but rather
finer make, is used for Sea Island and other fine cotton, and for
any species of fibrous material; but for grain, spices, sugar,
fLOUR, coffee, manure, &c., the threads of warp and weft must
lie closer, and the warp is usually single. For transporting such
substances as sugar, it is not uncommon to line the bag with paper, which excludes foreign matter, and minimizes the loss. Although there are large quantities of seamless bags woven in the loom, the greater part of the cloth is woven in the ordinary way. It is then cut up into the required sizes by hand and by special machines, and afterwards sewn by one of the chain-stitch or straight-stitch bag sewing-machines.

**BAGHAL**, a small native state in the Punjab, India. It is one of the group known as the Simla Hill states, and has an area of 124 sq. m.; pop. (1901) 23,700, showing an increase of 5% in the decade; a revenue £3,500.

**BAGHORIA**, a town of the province of Palermo, Sicily, 8 m. by rail E. by S. of Palermo. Pop. (1901) 18,218. It contains many villas of the aristocracy of Palermo, the majority of which were erected in the 18th century, but have now fallen into decay.

**BAGHILL**, a town of Flintshire, North Wales, 14½ m. from Chester, on the London & North Western railway, in the ancient parish of Holywell. Pop. (1901) 2637. Its importance is due to its zinc, lead, iron, alkali and kindred works, and its collieries. Above Bagillt is Bryn Dychwiel, "Hill of Retreat," so called from the fact that it was occupied by Bishop Gwilym, when pursued by Henry II., with superior numbers. Near is Mostyn Hall, dating from the time of Henry VI., the seat of one of the oldest Welsh families. Here are antiquities and MSS. (old British history and Welsh, brought from Gloddaeth), a harp dated 1668, torques (torcchau), &c. Henry VII., then earl of Richmond, is said to have been concealed here in the reign of Richard III., when the lord of Mostyn was Richard ap Howel.

**BAGMOND'S ROLL.** In 1274 the council of Lyons imposed a tax of a tenth part of all church revenues during the six following years for the relief of the Holy Land. In Scotland Pope Gregory X. entrusted the collection of this tax to Master Boiamund (better known as Bagimund) de Vitia, a canon of Asti, whose roll of valuation formed the basis of ecclesiastical taxation for some centuries. Boiamund proposed to assess the tax, not according to the old conventional valuation but on the true value of the properties at the time of assessment. The clergy of Scotland objected to this innovation, and, having held a council at Perth in August 1275, prevailed upon Boiamund to return to Rome for the purpose of persuading the pope to accept the older method of taxation. The pope insisted on the tax being collected according to the true value, and Boiamund returned to Scotland to superintend its collection. A fragment of Bagmond's Roll in something very like its original form is preserved at Durham, and has been printed by James Raine in his _Priory of Coldingham_ (Publications of the Surtees Society, vol. xii.). It gives the real values in one column and tenth parts in another column of each of the benefices in the archdeaconry of Lothian. The actual taxation to which this fragment refers was not the tenth collected by Boiamund but the tenth of all ecclesiastical property in England, Scotland, Wales and Ireland granted by Pope Nicholas IV. to Edward I. of England in the year 1298. The fragment should therefore be regarded as supplementary to the _Taxatio Ecclesiastica Angliae et Walliae_ printed by the Record Commissioners in 1882. Although no contemporary copy of Bagmond's Roll is known to exist, at least three documents give particulars of the taxation of the Church of Scotland in the 16th century, which are based upon the original roll.

See _Statuta Ecclesiae Scoticae_ (Bannatyne Club, Edinburgh, 1866).

**BAGIRMI**, a country of north-central Africa, lying S.E. of Lake Chad and forming part of the Chad circumscription of French Congo. It extends some 240 m. north to south and has a breadth of about 150 m., with an area of 20,000 sq. m. The population in 1903 was estimated at 100,000, having been greatly reduced as the result of wars and slave-raiding. By including districts S. and S.E. occupied by former vassal states, the area and population of Bagirmi would be more than doubled. The surface of the country, which lies about 1000 ft. above sea-level, is almost flat with a very slight inclination N. to Lake Chad. It forms part of what seems to be the basin of an immense lake, of which Chad is the remnant. The soil is clay. The river Shari (g.r.) forms the western boundary. Numerous tributaries of the Shari flow through the country, but much of the water is absorbed by swamps and sand-obstructed channels, and seasons of drought are recurrent. The southern part of the country is the most fertile. Among the trees the acacia and the dum-palm are common. Various kinds of rubber vine are found. The fauna includes the elephant, hippopotamus, lion and several species of antelope. Ants are very numerous. Millet and sesame are the principal grains cultivated. Rice grows wild, and several kinds of Poa grass are used as food by the natives. Cotton and indigo are grown to a considerable extent, especially by Bornu immigrants. The capital is Chekna, on a tributary of the Shari, the former capital, Massenia, having been destroyed in 1898. Fort Lamy at the confluence of the Logone and Shari, and Fort de Cointet on the middle Shari, are French posts round which towns have grown. Trade is chiefly with Yola, a town on the Benue in British Nigeria, and with Khartum via Wadai. There is also an ancient caravan route which runs through Kanem and across the Sahara to Tripoli.

The population of Bagirmi is mixed. Negroid peoples predominate, but there are many pastoral Fulà and Arabs. The Bagirmat people proper are a vigorous, well-formed race of Negroid-Asia blood, differing from the Bagirmat people proper, who are a race of ancient origin, and by the language, which resembles those spoken on the White Nile. On their arrival they appear to have taken the place of the Bulala dynasty. They subdued the Fulà and Arabs already settled in the district, and after being converted to Islam under Abdullah, their fourth king (about 1600), they extended their authority over a large number of tribes living to the south and east. The most important of these tribes are the Saras, Gaberi, Somrai, Gulla, Nduka, Nuba and Sokoro. These pagan tribes were repeatedly raided by the Bagirmat people for slaves. Most of them are of a primitive type and appear to be dying out. The Saras are remarkable for their herculan stature, and are one of the most promising of African races. Tree worship is prevalent among the Somrai and the Gaberi. All the tribes believe in a supreme being whose voice is the thunder. Polygamy is general in upper Bagirmi, where some traces of a-matriarchal stage of society linger, one small state being called Beled-el-Mra, "Women’s Land," because its ruler is always a queen.

Bagirmi was made known to Europe by the travels of Dixon Denham (1823), Heinrich Barth (1852), who was imprisoned by the Bagirmat people for some time, Gustav Nachtigal (1857), and F. Matteucci and A. M. Massari (1881). The country in 1871 had been conquered by the sultan of Wadai, and about 1890 was over-run by Rabah Zobeir (q.v.) who subsequently removed farther west to Bornu. About this time French interest in the countries surrounding Lake Chad was aroused. The first expedition led thither through Bagirmi met with disaster, its leader, Paul Cramel, being killed by order of Rabah. Subsequent missions were more fortunate, and in 1897 Emile Gentil, the French commissioner for the district, concluded a treaty with the sultan of Bagirmi, placing his country under French protection. A resident was left at the capital, Massenia, but on Gentil's withdrawal Rabah descended from Bornu and forced sultan and resident to flee. It was not until after the death of Rabah in 1902 and the rout of his sons (1901) that French authority was firmly established. Kanem, a country north of Bagirmi and subject in turn to it and to Wadai, was at the same time brought under French control. So far as its European rivals are concerned, the French right to these regions is based on the Franco-German convention of the 15th of March 1894 and the Anglo-French declaration of the 21st of March 1899.

See H. Barth, _Travels and Discoveries in North and Central Africa_ (London, 1855-1858); G. Nachtigal, _Sahara und Sudan_ (Berlin, 1879-1899); E. Gentil, _La Chute de l'Empire de Rabah_ (Paris, 1902). _Also French Congo._

**BAGNACAVALLO, BARTOLOMMEO** (1484-1542), Italian painter. His real name was RAMEGNI, but he received the cognomen Bagnacavallo from the little village where he was born. He studied first under Franca, and then proceeded to
BAGNÈRES-DE-BIGORRE—BAG-PIPE

Rome, where he became a pupil of Raphael. While studying under him he worked along with many others at the decoration of the gallery in the Vatican, though it is not known what portions are his work. On his return to Bologna he quickly took the leading place as an artist, and to him were due the great improvements in the general style of what has been called the Bolognese school. His works were considered to be inferior in point of design to some other productions of the school of Raphael, but they were distinguished by rich colouring and graceful delineation. They were highly esteemed by Guido Reni and the Caracci, who studied them carefully and in some points imitated them. The best specimens of Bagnacavallo's works, the "Dispute of St Augustine," and a "Madonna and Child," are at Bologna.

BAGNÈRES-DE-BIGORRE, a town of south-western France, capital of an arrondissement in the department of Hautes-Pyrénées, 13 m. S.S.E. of Tarbes on a branch line of the Southern railway. Pop. (1906) 6661. It is beautifully situated on the left bank of the Adour, at the northern end of the valley of Campan, and the vicinity abounds in picturesque mountain scenery. The town is remarkably neat and clean and many of the houses are built or ornamented with marble. It is one of the principal watering-places in France, and has some fifty mineral springs, characterized chiefly by the presence of sulphate of lime or iron. The thermal ranges appear on a map dated 123° Fahr., and they are efficacious in cases of rheumatism, nervous affections, indigestion and other maladies. The season begins in May and terminates about the end of October, during which time the population is more than doubled. The Promenade des Coustous is the centre of the life of Bagnères. Close by stands the church of St Vincent of the 14th and 15th centuries. The old quarter of the town, in which there are several old houses, contains a graceful octagonal tower of the 15th century, the remains of a Jacobin monastery. The Néothermes, occupying part of the casino, and the Thérames (dating from 1824), which have a good library, are the principal bathing-establishments; both are town property. The other chief buildings include the Carmelite church, remains of the old church of St Jean, a museum and the town-hall. Bagnères has tribunals of first instance and of commerce, and a communal college. The manufacture of bure, a light fabric of silk and wool, and the weaving and knitting of woolen goods, wood-turning and the working of marble found in the neighbourhood and imported from elsewhere, are the chief industries. Bagnères is also the seat of the bishopric of Lescar.

BAGNÈRES-DE-LUCHON, a town of south-western France, in the department of Haute-Garonne, 87 m. S.S.W. of Toulouse, on a branch line of the Southern railway from Montpellier. Pop. (1906) 3448. The town is situated at the foot of the central Pyrenees in a beautiful valley at the confluence of the One and the Pique. It is celebrated for its thermal springs and as a fashionable resort. Of the promenades the finest and most frequented are the Allées d'Etigny, an avenue planted with lime-trees, at the southern extremity of which is the Thérams, or bathing-establishment, one of the most complete in existence. The springs, which number 48, vary in composition, but are chiefly intermixed with sulphate of sodium, and range in temperature from 62° to 150° Fahr. It is largely a watering-place of the town in 1877. The discovery of numerous Roman remains attests the antiquity of the baths, which are identified with the Ouenicium Thermae of Strabo. Their revival in modern times dates from the latter half of the 18th century, and was due to Antoine Méréet d'Etigny, intendant of Auch.

BAGOAS, a Persian name (Bagoia), a shortened form of names like Bagadatta, "given by God," often used for eunuchs. The best-known of these ("Bagosae," in Josephus) became the confidential minister of Artaxerxes III. He threw in his lot with the Rhodian condottiere Mentor, and with his help succeeded in subjugating Egypt again to the Persian empire (probably 342 B.C.). Mentor became governor of the maritime provinces, suppressed the rebels, and sent Greek mercenaries to the king, while Bagoas administered the upper satrapies and gained such power that he was the real master of the kingdom (Diod. xvi. 50; cf. Didymus, Comm. in Demosth. Phil. vi. 5). He became very wealthy by confiscating the sacred writings of the Egyptian temples and giving them back to the priests for large bribes (Diod. xvi. 51). When the high priest of Jerusalem, Jesus, murdered his brother Johannes in the temple, Bagoas (who had supported Johannes) put a new tax on the Jews and entered the temple, saying that he was purer than the murderer who performed the priestly office (Joseph. Ant. xi. 7.1). In 338 Bagoas killed the king and all his sons but the youngest, Arses (q.v.), whom he raised to the throne; two years later he murdered Arses and made Darius III. king. When Darius attempted to become independent of the powerful vizier (χιαλαπχος), Bagoas tried to poison him too; but Darius was warned and forced him to drink the poison himself (Diod. xvi. 5; Johann. Antioch. p. 38, 39 ed. Müller; Arrian ii. 14, 5; Curt. vi. 4, 10). A later story, that Bagoas was an Egyptian and killed Artaxerxes III. because he had killed the sacred Apis (Aelian, Var. Hist. vi. 8), is without historical value. He was afterwards viceroy of Egypt, and as such was presented by Alexander to Parmenio (Plut. Alex. 39); his residence in Babylon, with the best species of palms, is mentioned by Theophrastus (Hist. Plant. ii. 6; Pln. Nat. Hist. xii. 41). Another eunuch, Bagoas, was a favourite of Alexander the Great (Dicæarchus in Athen. xii. 639b; Plut. Alex. 67; Aelian, Var. Hist. 3.23; Curt. vi. 5, 23 x. 1. 52 ff.). (Eo. M.)

BAG-PIPE (Celt. piob-mal, uillan-piob, cuisean, cuisiun; Fr. cornemuse, chalémie, musette, sourdine, chevrette, loure; Ger. Sackpfeife, Dudelsack; M. H. Ger. Suedgablach¹; Ital. cornamusso, piva, sampogna, surdelina; Gr. ἐλακωτοῦ; Lat. ascalusus (?), tibia utricularis, utricularium; med. Lat. corusus), a complex reed instrument of great antiquity. The bag-pipe forms the link between the syrinx (q.v.) and the primitive organ, by furnishing the principle of the reservoir for the wind-supply, combined with a simple method of regulating the sound-producing pressure by means of the arm of the performer. The bag-pipe consists of an air-tight leather bag having three to five apertures, each of which contains a fixed stock or short tube. The fundamental tone is produced by the reception of the pipes, and as such are air-chambers for the accommodation and pressure of the reeds in the pipes. The pipes are of three kinds: (1) a simple valved insufflation tube or "blow-pipe," by means of which the performer fills the bag-reservoir; (2) the "chaunter" (chanter) or the melody-pipe, having according to the variety of the bag-pipe a conical or a cylindrical bore, lateral holes, and in some cases keys and a bell; the "chaunter" is invariably made to speak by means of a double-reed; (3) the "drones," jointed pipes with cylindrical bore, generally terminating in a bell, but having no lateral holes and being capable, therefore, of producing but one fixed note.

The main characteristic of the bag-pipe is the drone ground bass which sounds without intermission. Each drone is fitted with a beating-reed resembling the primitive "squeaker" known to all country lads; it is prepared by making a cut partly across a piece of cane or reed, near the open end, and splitting back from this towards a joint or knot, thus raising a tongue or flap. The beating-reed is then fixed in a socket of the drone, and the air forced through the slot. The sound is produced by the stream of air forced from the bag through the reed of the drone, the pressure of the performer’s arm, causing the tongue of reed to vibrate over the aperture, thus setting the whole column of air in vibration. The drone-pipe, like all cylindrical tubes with reed mouthpieces, has the acoustic properties of the closed tube and produces the note of a pipe twice its length. The drones are tuned by means of sliding-joints.

The blow-pipe and the chaunter occupy positions at opposite extremities of the bag, which rests under the arm of the performer while the drones point over his shoulder. These are the main features in the construction of the bag-pipe, whose numerous varieties fall into two classes according to the method of inflating the bag: (1) by means of the blow-pipe described above, or (2) by means of a small bellows connected by a valve-fed pipe with the bag and worked by the other arm or elbow to which it is attached as a lap or strap.

Class I comprises: (a) the Highland bag-pipe; (b) the old Irish bag-pipe; (c) the cornemuse; (d) the bigou or binou (Breton bag-pipe); (e) the Calabrian bag-pipe; (f) the casacular of the Greeks and Romans; (g) the tiuba urticarlis; (h) the chorus. To Class II belong: (a) the musette; (b) the Northumbrian or border bag-pipe; (c) the Lowland bag-pipe; (d) the union pipes of Ireland; (e) the surdelina of Naples.

1. The Highland Bag-pipe.—The construction of the Highland pipes is practically that given above. The chaunter consists of a conical wooden tube terminating in a bell and measuring from 14 to 16 in., including the bell. The reeds are seven in number, and one at the back for the thumb of the left hand, which fingers the upper holes while the right thumb merely supports the instrument. The holes are stopped by the under part of the joints of the fingers. There is in addition a key or part of the bag by means of which the pitch is regulated. For the double reed is not manipulated by the lips of the performer, only nine notes are obtained from the chaunter, as shown:

\[ \begin{array}{c|c|c|c|c|c|c|c|c|c} \hline & & & & & & & & & \\ \hline C & D & E & F & G & A & B & C & D & E \\ \hline \end{array} \]

The notes do not form any known diatonic scale, for in addition to the C and F being too sharp, the notes are not strictly in tune with each other. Donald MacDonald, in his treatise on the bag-pipe, states that "the pipe makes no attentive to the flats and sharp marks in the clef, as they are not used in pipe music; yet the pipe imitates several different keys which are real, but ideal on the bag-pipe, as the music cannot be transposed for it into any other key than that in which it is first played or marked." Mr. Glen, the great authority on the bag-pipe, infers that "if the chaunter were made to be performed in any one scale, it would not go well with the drones. Also, there would not be nearly so much music produced (if you take into consideration that it has only nine variable notes) as at present, in which case it would have a key to D, E, and A. Of course we do not mean that it has all the intervals necessary to form scales in all those keys, but that we find it playing tunes that are in one or other of them."

The three drones are usually tuned to A, the two smallest one octave below the A of the chaunter, and the largest two octaves below. The three principal methods of tuning the drones are shown as follows:

A. J. Ellis.  
David Glen.  
Angus Mackay.

The excessive use of ornamental notes on the Highland bag-pipe has been described as "the technical peculiarity of the instrument, which makes a repetition of the same note difficult without the interpolation of what is known among pipers as "cuts" or "warblers," i.e., grace notes. These warblers consist not only of single notes but of groups of notes to three seven notes, not consecutive but in leaps, assist in relieving the constant discord with the drone bass. Skilful pipers have been known to introduce warblers of as many as eleven notes between two beats in a bar. The use of ornamental notation for the Highland pipe tunes is a recent innovation; the pipers used verbal equivalents for the notes; for instance, the piobaireachd Cogheigh nha Shie, "War of peace," which opens as shown here, was taken down by Capt. Niel MacLeod from the piper John M'Crummen of Skye as verbally taught to apprentices as follows:

"Hodroho, hodroho, hamnin, hichin,  
Anodroho, hodroho, hodroho, hachin,  
Hodroho, hodroho, hamnin, hichin," &c.

The conclusion of the tune is thus expressed:

"Huindratatereg, huindratatereg, huindratatereg, huindratatereg."  

Written down this seems a mere unintelligible jumble, but could we hear it, as sounded by the pipers, with due regard for the rhythmical value of notes, it would be a very different matter. Alexander Campbell relates that a melody had to be taken down or translated from the syllabic jargon of illiterate pipers into musical characters, which, when correctly transposed, would to his astonishment coincide exactly with musical notation.

A Highland bag-pipe of the 15th century, dated MCCCCXIX., in the possession of Messrs. J. & R. Glen of Edinburgh, was exhibited at the Royal Military Exhibition in London in 1890 (see fig. 1 (4)) There were two drones, inserted in a single stock in the form of a wide-spread fork, and tuned to A in unison with the lowest note of the chaunter, which had seven finger-holes in front and a thumb-hole at the back.

![Fig. 1. (1) Cornemuse. (2) Irish bag-pipe. (3) Musette. (4) Highland bag-pipe. A.D. 1409. (5) Border bag-pipe.](image)

(From Capt. C. R. Day's Descriptive Catalogue of Musical Instruments exhibited at the Royal Military Exhibition, by permission of Eyre & Spottiswoode.)

The old Irish Bag-pipe.—Very little is known about this instrument. It is mentioned in the ancient Breton Laws, said to date from the 5th century (they are cited in compilations of the 10th century), in describing the order of precedence of the king's bodyguard and household in the Crih Gubblich: "Poets, harpers, pipers, horn-blowers and jugglers have their place in the south-east part of the house." The word used for (bag-) piper is Cistenn-

BAG-PIPE

The cornemuse and chalumeau were the bag-pipes in use in France, Italy and the Netherlands before the advent of the musette, to which they bear the same relation as the old Irish bag-pipe does to the union-pipes, or the cornemuse or piva to the tampagone, or surdelina in Italy. Two kinds of cornemuses were known in France during the 16th and 17th centuries, differing in one important structural detail, which affected the timbre of the instruments. Pére Marin Mersenne \(^1\) has given a detailed description of these varieties and of the musette, with very clear illustrations of the instruments and all their parts. The cornemuse or drone used by shepherds, and as a solo instrument (see fig. 1), was similar to the Highland bag-pipe; it consisted of a leather bag, inflated by means of a valved blow-pipe; a large drone (gross bourdon) 21 ft. long included the lengthening reed; a second reed, 21 in. long, and was fixed in the stock; the small drone (petit bourdon), 1 ft. in length including a reed 2 in. long, also had a beating-reeed and was fixed in the same stock as the drone. The two drones were tuned to C. The chalumeau, which had a conical bore and a double reed like an oboe, but hidden within the stock; it could be taken out and played separately, when the compass given by the eight holes (seven in front and a thumb-hole) C to C' could be increased by a third to D, by overblowing the D and E an octave by pressure of the breath and lips on the reed, now taken directly into the mouth. The second kind of cornemuse was played in concert with a family of drones known as Hautbois de Poitou, a hautbois having the reed enclosed in an air-chamber, just as is the case with the reeds of the bag-pipe. This cornemuse had but one drone which could, like others, be lengthened for tuning by drawing out the joint; the reed was not a beating-reeed but a doux reed like that of the chalumeau; this constitutes the main difference between the two cornemuses. The chalumeau had eight holes, the lowest of which was covered by a key enclosed in a perforated box.

The bag-pipe of Duderstadt of Germany was an instrument of some importance made in no less than five sizes, all described and illustrated by Michael Praetorius.\(^2\) They consist of the Grosser Bock or double-bass bag-pipe, a formidable-looking instrument with a single cylindrical drone of a great length, terminating, as did the other, in a curved ram's horn (to which the name was due). The chalumeau had seven finger-holes and a vent-hole in front, and a thumb-hole at the back. The drone was tuned to G, an octave below the chalumeau.

**Compass of drone.**

**Compass of chalumeau.**

**Sackpfeife or Dudelsack.**

The Bock, of similar construction, was pitched a fourth higher in C. The Schneiderfife had two drones in Bb and F. Praetorius explains that the upper notes of the chalumeau of this sackpfeife had a faulty intonation, and that owing to the presence of the thumb-hole, usual in all other varieties of the instrument, they were more difficult to play than on the bag-pipe.

**Compass of chalumeau.**

**Drones.**

**Schöfferfife.**

The Himmelchen had two drones tuned to F and C. The Duder or treble sackfife was the smallest of the family, and had three drones tuned to E, Bb and E, and a chalumeau with a compass ranging from F to E. In Magdeburg (see op. cit. Theutn., pl. v, No. 4), which was somewhat larger than the schneiderfife and pitched a comma lower, there were eight drones mounted in one stock, each having three holes in front and one for the thumb at the back. The right-hand chalumeau sounded the five notes D, E, F, G, A, and the left-hand chalumeau, A, E, D, F, G, and a. The performer was enabled to play simple two-part melodies on the Magdeburg bag-pipe. Praetorius mentions in addition the French bag-pipe (musette), similar in pitch to the himmelchen, but inflated by means of the bellows.

**Compass of chalumeau.**

**Drones.**

Praetorius also mentions a different kind of sackfife he saw in Magdeburg (see op. cit. Theutn., pl. v, No. 4), which was somewhat larger than the schneiderfife and pitched a comma lower. There were two drones mounted in one stock, each having three holes in front and one for the thumb at the back. The right-hand chalumeau sounded the five notes D, E, F, G, A, and the left-hand chalumeau, A, E, D, F, G, and a. The performer was enabled to play simple two-part melodies on the Magdeburg bag-pipe. Praetorius mentions in addition the French bag-pipe (musette), similar in pitch to the himmelchen, but inflated by means of the bellows.

\(^2\) Syntagma Musicum, part ii., De Organographia (Wolfenbüttel, 1618): republished in Band xiii. of the Publicationen der Gesellschaft für Musikforschung (Berlin, 1884), chap. xix. and pl. v., xi., xii.

The Calabrian bag-pipe has a bag of goatskin with the hair left on, and is inflated by means of a blow-pipe. There are two drones and two chalumeau, all fixed in one stock. Each chalumeau has three or four finger-holes and the right-hand pipe has the fourth compass opened by a key closed in a perforated box; both drones and chalumeau have double reeds.

The ancient Greek bag-pipe (see Askales), and the Roman tubia stricataris, belonged to this class of instrument, inflated by the mouth, but it is not certain that they had double drones. The drones, inflated by means of a small bellows worked by the arm, has as prototype the musette (see fig. 1 (3)), which is said to have been evolved during the 15th century from the end of the 15th century there were always musette players.\(^3\) They were distinguished by inflating the bag; for the long cumber-some drones was substituted a short barrel drone, containing the necessary lengths of tubing for four or five drones, reduced to the smallest and most compact form. The bores were pierced longitudinally down their length, and end with a series of holes, each of which had keys, giving a compass of twelve notes from F to C. This number of notes was not invariable. After Mersenne's time, Jean Hotteterre (d. 1737), a court musician, belonging to the band known as the Musique de la Grande Écurie, in which he played the desseus de hautbois, introduced certain improvements in the drones of the musette.\(^4\) His son Martin Hotteterre (d. 1712) added a second drone to the musette, and it was inserted instead of being inserted into the stock. The Hotteterre chalumeau, known as le petit chalumeau, had six keys, whereas the grand chalumeau had seven, besides eight finger-holes and a vent-hole. All the drones had a little finger of the left hand and the thumb of the right hand, which were not required to stop holes on the large chalumeau. The grand et petit chalumeau are figured in detail with keys and holes in a rare and anonymous work by Borjon (or Bourgoine),\(^5\) who gives much information on the instrument and its history. The bellows, he states, borrowed from the organ, were added to the musette about forty or fifty years before he wrote his treatise. The compass of the improved musette of Hotteterre was as shown:

<table>

The four or five drones were usually tuned thus:

- the eight holes of the grand chalumeau
- the seven keys of the grand chalumeau
- the six keys of the petit chalumeau
- the four or five drones were usually tunned thus:

The chalumeau and drones were pierced with a very narrow cylindrical bore, and double reeds were used throughout, causing them to speak when closed pipes; this accounts for the deep pitch of these relatively short pipes (see Aulus). Martin Hotteterre was the first to introduce the second drone for the bag-pipe, since

\(^3\) See E. Thiénon, Les Hotteterre et les Chalumeaux, célèbres facteurs de flûtes, hautbois, bassons et musettes (Paris, 1894), p. 23. It is probable, however, that M. Thiénon, who makes this statement, has not considered the possibility of the word musette applying to this case to the small rustic hautbois or desseus de bombe, also written mus, musette, musette, which occurs in many ballads of the 13th, 14th and 15th centuries. See Fr. Godfrey, Dictionnaire de l'ancien langage de la France du XIXe au XVIIIe siècle (Paris, 1888).

\(^4\) Musette de Poitou; probably the cornemuses used in concert with the Hautbois de Poitou.

\(^6\) See Ernest Thiénon, op. cit. pp. 15 et seq. (cf. Jules Ecorcheville, "Traité de la musique avec une nouvelle méthode, &c. (Lyons, 1672), pp. 25-27 and plate. A copy of this work is in the British Museum."
BAG-PIPE

205

Praetorius in 1618 figures and describes the Magdeburg sack-pipefeet with two chanuts, but without keys and with a conical bore.

The *surdulina* or *sambahna* is described and illustrated by Merseme 1 as the *musette* de Naples; its construction was very complicated, and from this that the instrument was invented by Jean Baptiste Kva (who was living in Paris in 1620), Dom Julio and Vincenzo; but Merseme seems to have made alterations himself in the original instrument, which are not very clearly explained. There are two chanuts with a conical bore and having both finger-holes and keys; and two drones each having two keys. The four pipes were fixed in the same stock, and double reeds were used throughout; the bag was inflated by means of *bagpipes* with finger-holes and keys, or the usual kind for the zampogna in 1628, under the title of *Canora Zampogna*.

The modern *Lowland bag-pipe* differs from the Highland bag-pipe mainly in that it is blown by bellows instead of by the mouth.

The Northumbrian or Border bag-pipe, also blown by means of bellows, is distinguished by having a chanter stopped at the lower end so that when all the holes are closed, the pipe is silent. There are seven finger-holes, one for the thumb, and a varying number of keys. The four drones are fixed in one stock and are stopped by means of stoppers, so that, as in the musette, any one of them may be silenced. A fine Northumbrian bag-pipe from the collection of Rev. W. F. Galpin is illustrated (fig. 1 (5)).

The union pipes of the 18th century, or modern Irish bag-pipe, were blown by means of bellows (see fig. 1). The seven finger-holes, one thumb-hole and eight keys, which together gave the chromatic scale in two octaves. The drones were tuned to Λ in different octaves, and three regulators or drones with keys, played by the bellows, were supported by bellows, and the slides correspond to the sliders on the drone-barrel of the musette.

**History of the Bag-pipe.**—There is reason to believe that the origin of the bag-pipe must be sought in remote antiquity. No instrument in any degree similar to it is represented on any of the monuments of Egypt or Assyria known at the present day; we are, nevertheless, able to trace it in ancient Persia and by inference in Egypt, in Chaldæa and in ancient Greece.

The most characteristic feature of the bag-pipe is not the obvious bag or air-reservoir from which the instrument derives its name in most languages, but the fixed harmony of the buzzing drones. The principle of the drone, i.e. the beating-reed sunk some three inches down the pipe, was known to the ancient Egyptians. In a pipe discovered in a mound-case and now in the museum at Turin, was found a straw beating-rod in position. The arghoul (q.v.), a modern Egyptian instrument, possesses the characteristic feature of drone and chanter without the bag. The same instrument occurs once in the hieroglyphs, being sounded as-*li*, and once on a mural painting preserved in the Musée Guimet and reproduced by Victor Loret. 2 During Jacques de Morgan’s excavations in Persia some terra-cotta figures of musicians, dating from the 8th century B.C., were discovered in a *tell* (mound) at Susa, 4 two of which appear to be playing bag-pipes; the chanter, curved in the shape of a hook from the stock, is clearly visible, the bag under the arm is indicated, and the lips are pursed as if in the act of blowing, but the insuffluation tube is absent; a round hole in one of the figures suggests its presence formerly.

Among the names of musical instruments in Daniel iii. 5 and 15, the sixth, generally but wrongly rendered "dulcimer," is thought by many scholars to signify a kind of bag-pipe (see commentaries on Daniel and the theological encyc.).

The belief is based on the supposition that the Aramaic *sumpony* is a loan-word from the Greek *σύμφωνα* (see Daniel 3:5). 6 This supposition is based on the modern pronunciation of *sympoia*. The argument is, however, exceedingly weak.

In the first place, the date of the book of Daniel is matter of controversy, hinging partly on precisely such questions as the true significance and derivation of *sumpony*.

Second, it is possible that the word *sumpony* is a late interpolation. Third, its exact form is uncertain; in verse 10, *罂.fromCharCode(9960)* is used of the same instrument, suggesting a derivation from the Gr. *δύσφων* (tube or pipe).

Fourth, even if *sympoia* is the source of the word, there is very little evidence that it was used for any particular instrument. The original natural sense of *sympoia* is "a concord of sound," "a concordant interval," and the evidence of its use for a particular instrument is of the 2nd century B.C., and, even so, very slight. Only one passage (Polyb. xxvi. 10. 5) really bears on the question, and there the translation of the word depends on a context the reading of which is uncertain (see SYMPHONA). It is, however, curious that the bag-pipe was known in Italy and Spain during the middle ages, the two countries through which Eastern culture was introduced into Europe, by the name of *sambahna* or *sampaona*, which strongly recall the Chaldæan *sumpony*; and further that in the same countries the word *sinfonia* should be co-existent with *sambahna* and have the original meaning attached to the classical *sympoia*, "a concord of sound." A single passage only in Dion Chrysostom (see Askaules) is enough to prove that the instrument was known in Greece in A.D. 100. 7 The Greeks had undoubtedly received some kind of bag-pipe from Egypt (in the form of the as-*li*), or from Chaldæa, but it remained a rustic instrument used only by shepherds and peasants. This conclusion is supported by allusions in Aristophanes and in Plato, which unfortunately refer to the *singe*, "This, dear Crito, is the voice of my pipes." I seem to hear murmuring in my ears like the sound of the flute (ulas) in the ears of the mystic; that voice, I say, is humming in my ears." 8 Aristophanes, in his play *The Acharnians*, indulges in a flight of satire at the expense of the musical Boetians, by making a band of Theban pipers play a Boetian merchant and his slave into town. The musicians are dubbed "bumblebee pipers" (*βουβαδιλον*, l. 866) by the exasperated inhabitants.

The verb used here for "blowing" is *φωνα*, the very word applied to blowing or inflating the bellows (*φωνα*), and not the usual verb *αθέλω*, to play the *ulas*. Another instrument, mentioned by Aristophanes in *Lysistrata* (l. 1242 and 1245), which was probably a kind of bag-pipe, is also derived from *φωνα*, i.e. *physallis*, the "concrete," 9 and *physstera*, the "collective" form of instrument. We leave the realm of inference for that of certainty when we reach the reign of Nero, who had a passion for the *Hydraulus* (see Organ: History) and the *tibia utricularis*. 10 That the bag-pipe was introduced by the Romans into the British Isles is a conclusion supported by the discovery in the foundations of the praetorian camp at Richborough of a small bronze figure of a Roman soldier playing the tibia utricularis.

The Rev. Stephen Westman, who made a communication on the subject to *Archaeologia*, 11 points out further the interesting fact in connexion with the instrument, that the Romans had instituted colleges for training pipers on the bag-pipe, a practice followed in the Highlands in the 18th century and notably in Skye.

Gruterus 12 mentions among the fraternities a *Corpus et Collegium Utriculariorum*, and Spon 3 also quotes the *Collegio Utricular*.

The bag-pipe in question appears to have two drones in front pointing towards the right shoulder, and although no chanter is shown in the design, both hands are held in correct positions over the spot where it ought to be; it may have been broken off. The bronze figure has been reproduced from drawings by Edward King in three positions. 13 The statement made by several writers on music that a bag-pipe is represented on a terracotta from Richborough, as a verification of certain references will show. 14 The error is due in the first place to 6 Dion Chrysostom, ed. Adolphus Empeiros (Brunswick, 1864), p. 728 or bxxi. (R) 381. See Pauly-Wissowa, Realencyclopädie, s. v. Askaules.

7 The suggestion the writer owes to Mr. G. Barwick of the British Museum.

15 Miscell. eruditi, antiquitatis.

17 See Montefaucon, Suppl. de l'antique, expliquée, vol. iii. pl. xlvii., Nos. 1 and 2, and explanation p. 189; Francesco Bianchini, de
Montfaucon, who misunderstood the explanation of Bianchini's drawing which he reproduced. The cornetiere referred to is one containing the hydraulic organ, and the legend *Lutem Lucem Aug.*, but no bag-pipe. Bianchini gives a drawing of a bag-pipe with two long drones, which, he says, was copied from a marble relief over the gateway of the palace of the prince of Santa Croce in Rome, near the church of San Carlo ad Catinari. If the drawing be accurate and the sculpture of classical Roman period, it would corroborate the details of the instrument held by the little bronze figure of the Roman soldier.

From England the bag-pipe spread to Caledonia and Ireland, where it took root, identifying itself with the life of the people, as a military instrument held in great esteem by the Celtic races. The bag-pipe was used at weddings and funerals, and at all festivals; to lighten labour, during the 18th century, as for instance in Skye, in 1786, when the inhabitants were engaged in roadmaking, and each party of labourers had its bag-piper. It was used in old mysteries at Coventry in 1534. Readers who wish to follow closely the history of the bag-pipe in the British Isles should consult Sir John Graham Dalzell's *Musical Memoirs of Scotland* (London, 1849, with illustrative plates).

On the downfall of the Roman empire, the bag-pipe, sharing the fate of other instruments, probably lingered for a time among itinerant musicians, actors, jugglers, &c., reappearing later in primitive guise with the stamp of naivete which characterizes the productions of the early middle ages, and with a new name, *chois* (q.v.). An illustration of a Persian bag-pipe dating from the 6th century A.D. (reign of Chosroes II) is to be found on the great arch at Takht-i-Bostan (see fig. 2). This very crude representation of the bag-pipe can only be useful as evidence that during the fourteen centuries which elapsed between the moulding of the figure found in the *tell* at Susa, mentioned above, and the carving in the rock at Takht-i-Bostan, the instrument had survived. The reign of Chosroes was noted for its high standard of musical culture. The fault probably lies with the draughtsman, who drew the sculptures on the arch for the book. Nothing more is heard henceforth of the tibia utricularis. If the drawings of the early medieval bag-pipes, which are by no means rare in MSS. and monuments of the 9th to the 13th century, are to be trusted, it seems hard to understand the raison d'être of the instrument shown of its drones, to see how it justified its existence except as an ill-understood reminiscence. What could be the object of laboriously inflating a bag for the purpose of making a single clang upon a reed, which could be done so much more satisfactorily by taking the reed itself into the mouth, as was the practice of the Greeks and Romans? There is a fine psalter in the library of University Court, Glasgow, belonging to the Hunterian collection, in which King David is represented, as usual in the 12th century, playing or rather tuning a harp, surrounded by musicians playing bells, rebec, guitar fiddle (in *cello* position), quadruple pipes or *gianistra*, and a bag-pipe with long chanter having a well-defined stock. The insufflation tube appears to have been left out, and there are no drones to be seen.

There are interesting specimens of bag-pipes in Spanish illuminated MSS. such as the magnificent volume of the *Contigas di Santa Maria*, in the Escorial, compiled for King Alphonso the Wise (13th century). There are fifty-one separate figures of instrumentalists forming a kind of introduction to the canticles, and among the instruments are three bag-pipes, one of which is a remarkable instrument having no less than four long drones and two chanters which by an error of the draughtsmen are represented as being blown from the player's mouth. The fifty-six musicians have been reproduced in black and white by Juan F. Ruiz, and also by Don F. Aznar. Another fine Spanish MS. in the British Museum, Add. MS. 18,851, of the end of the 15th century, illustrated by Flemish artists for presentation to Queen Isabella, displays a profusion of musical instruments in innumerable concert scenes; there are bag-pipes on f. 13,412 & 410; one of these has two drones, one conical, the other cylindrical, bound together, and a curved chanter.

The most trustworthy evidence we have of the medieval bag-pipe is the fine Highland bag-pipe dated 1409, and belonging to Messrs. J. & R. Glen, described above. Edward Buhle points out that from the 13th century the bag-pipe became a court instrument played by minnesingers and troubadours, as seen in literature and in the MSS. and monuments. It was about 1250 that the human or animals' heads were used as stocks and bells for the chanters. The opinion advanced that the bellows were first added to the bag-pipe in Ireland seems untenable and is quite unsupported by facts; the bellows were in all probability added to the union-pipes in imitation of the musette. In the *Image of Ireland and Discoverie of Woodkarne*, by John Derrick, 1551, the Irish insurgents are portrayed in pictures full of life and character, as led to rebellion and pillage by a piper armed with a bag-pipe, similar to the Highland bag-pipe. The cradle of the musette is inconceivable anywhere but in France, among the courtiers and soldiers who used the same pipe and flageolet for courtly life and an artificial admiration and cult of Nature, idealized to harmonize with silks and satins. The cornemuse of shepherds and rustic swains became the fashionable instrument, but as inflating the bag by the breath distorted the performer's face, the bellows were substituted, and the whole instrument was refined in appearance and tone-quality to fit it for its more exalted position. The Hotteterre family and that of Chédeville were past masters of the art of making the musette and of playing upon it; they counted among their pupils the highest and noblest in the land. The cult of the musette continued throughout the 17th and 18th centuries until the 'seventies, when its popularity was on the wane and musettes figured largely in sales. Lully introduced the musette into his operas, and in 1768 the list of instruments forming the orchestra at the Opéra includes one musette. 

Illustrations of bag-pipes are found in the following MSS. in the British Museum:—2 B. VII. f. 192 and 197; 3 B. VII. f. 235 (the *Sforza* Book), f. 62; Add. MS. 272, f. 715; Add. MS. 17,280, f. 238; Add. MS. 24,686 (Tennison Psalter), f. 17; Add. MS. 17,280, f. 82; Add. MS. 24,687, f. 44; Add. MS. 32,454; Add. MS. 11,657, f. 38; &c. &c.

**BAGRATION, PETER, PRINCE** (1765–1812), Russian general descended from the noble Georgian family of the Bagratides, was born in 1765. He entered the Russian army in 1789, and served for some years in the Caucasus. He was engaged in the siege of Ochakov (1788), and in the Polish campaign of 1794, being present at the taking of Praga and Warsaw. His merits were recognized by Suvorov, whom he accompanied in the Italian and Swiss campaigns of 1799, winning peculiar distinction by the capture of the town of Brescia. In the wars of 1805 his achievements were even more brilliant. With a small rearguard he successfully resisted the repeated attacks of forces five times his own numbers (Hollabrunn), and though half his men fell, the retreat of the main army under Kutusov was thereby secured. At Austerlitz he was engaged against the left wing of the French army, under Murat and Lannes, and at Eylau, Heilsberg and Friedland he fought with the most resolute and stubborn courage. In 1808 by a daring march across the frozen Gulf of Finland he captured the Åland Islands, and in 1809 he commanded against the Turks at the battles of Rassowa and Tatarita. In 1812 he

commanded the 2nd army of the West, and though defeated at Mogilev (23rd July), rejoined the main army under Barclay, and during the retreat was at Borodino (7th Sept.), where he received a mortal wound. A monument was erected in his honour by the tsar Nicholas I. on the battlefield of Borodino.

**BAGSHOT BEDS**, in geology, a series of sands and clays of shallow-water origin, some being fresh-water, some marine. They belong to the upper Eocene formation of the London and Hampshire basins (England), and derive their name from Bagshot Heath in Surrey; but they are also well developed in Hampshire and the Isle of Wight. The following divisions are generally accepted:

- **Upper Bagshot Beds**: Barton sand, and Barton clay.
- **Middle**: Bracklesham beds.
- **Lower**: Bourneham beds, Alum Bay beds, and Bovey Tracey beds (?).

The lower division consists of pale-yellow, current-bedded sand and loam, with layers of pipeclay and occasional beds of flint pebbles. In the London basin, wherever the junction of the Bagshot beds with the London clay is exposed, it is clear that no sharp line can be drawn between these formations. The Lower Bagshot beds may be observed at Brentwood, Billericay and Highbeech in Essex; outliers, capping hills of London clay, occur at Hampstead, Highgate and Harrow. In Surrey considerable tracts of London clay are covered by heath-bearing Lower Bagshot beds, as at Weybridge, Aldershot, Woking, &c. The "Ramsdell clay," N.W. of Basingstoke, belongs to this formation. In the Isle of Wight the lower division is well exposed at Alum Bay (60 ft.) and White Cliff Bay (140 ft.); here it consists of unfossiliferous sands (white, yellow, brown, crimson and every intermediate shade), and clays with layers of lignite and ferruginous sandstone. Similar beds are visible at Bournemouth, and in the neighbourhood of Poole, Wareham, Corfe and Studland.

The leaf-bearing clays of Alum Bay and Bournemouth are well known, and have yielded a large and interesting series of plant remains, including *Eucalyptus*, *Caesalpinia*, *Populus*, *Platanus*, *Sequoia*, *Aralia*, *Polyodium*, *Osmunda*, *Nipadites* and many others. The sands and clays of Bovey Tracey (see Bovey Beds) are probably of the same age. The clays of this formation are of great value for pottery manufacture; they are extensively mined in the vicinity of Wareham and Corfe, whence they are shipped from Poole and are consequently known as "Poole clays"; similarly, "Teignmouth clay" is obtained from the Bovey beds. Alum was formerly obtained from the clays of Alum Bay; and the lignites have been used as fuel near Corfe and at Bovey.

The Bracklesham beds (q.v.) are sometimes classed with the overlying Barton clay as Middle Bagshot. In the London basin the Barton beds are unknown. In Surrey and Berkshire the Bracklesham beds are from 20 to 50 ft. thick; in Alum Bay they are 100 ft., with beds of lignite in the lower portion; and about here they are sharply marked off from the Barton clay by a bed of conglomerate formed of flint pebbles. The Upper Bagshot beds, Barton sand and Barton clay, are from 140 to 200 ft. thick in the Isle of Wight.

The Aggleston (or Haggerston) rock and Pokuckstone rock, near Studland in Dorsetshire, are formed of large indurated masses of the Lower Bagshot beds that have resisted the weather; Creechbarrow near Corfe is another striking feature due to the same beds. Many of the sarsen stones or greywethers of S.E. England have been derived from Bagshot strata.

**BAHADUR KHEL**, an Indian salt-mine in the Kohat district of the North-West Frontier Province, in the range of hills south of the village of Bahadur Khel between Kohat and Bannu. For a space of 4 m. in length by a quarter of a mile in breadth there exists an exposed mass of rock-salt with several large hillocks of salt on either side. The quarries extend over an area 1 m. long by half a mile broad, and the salt is hewn out in large blocks with picks and wedges. The Indian government formerly maintained a large preventive establishment for the preservation of the revenue, but it was withdrawn in 1808. Consumption of Kohat salt is restricted, on account of its paying less duty, to the tracts lying to the north of the Indus and to the frontier tribes. In 1903 the rate was fixed at R.1 per maund, against R.2 for the rest of India. The mines are under the control of the Northern India Salt Department.

**BAHADUR SHAH I.**, a Mogul emperor of Hindustan, A.D. 1707–1712, the son and successor of Aurangzeb. At the time of the latter's death his eldest surviving son, Prince Muizam, was governor of Kabul, and in his absence the next brother, Azam Shah, assumed the functions of royalty. Muizam came down from Kabul, and with characteristic magnanimity offered to share the empire with his brother. Azam would not accept the proposal and was defeated and slain on the plains of Agra. Muizam then ascended the throne under the title of Bahadur Shah. He was a man of 64 and died five years later. During his lifetime the empire was already falling to pieces before the intruders of the Sikhs and Mahrattas, and through internal dissensions.

**BAHADUR SHAH II.**, the last of the Mogul emperors of Hindustan, 1837–1857. He was a titular emperor only, since from the time of the defeat of Shah Alam at Buxar in 1764 all real power had resided with the East India Company; but all proclamations were still worded under "The King's Realm and the Company's rule." His sole importance is due to the use made of his name during the Mutiny of 1857. Always feeble in character, he was at that time old, and, from the first, was wholly at the mercy of the mutinous soldiery in Delhi, who were controlled by a council called the Barah Topi, or Twelve Heads. His papers, seized after the fall of Delhi, are full of senile complaint of the disrespect and discourtesy which he suffered from them. At the time of the assault he fled to the Tomb of Humayun, 6 m. from Delhi, where he was captured by Major Hodson. In January 1858 he was brought to trial for rebellion and for complicity in the murder of Europeans. The trial lasted more than two months. The substance of the king's defence was that he had been a mere instrument in the hands of the mutineers. On the 29th of March he was found guilty and sentenced to imprisonment for life. He was transported to Rangoon, and died there on the 7th of November 1862.

**BAHAMAS (Lucayos)**, an archipelago of the British West Indies. It is estimated to consist of 29 islands, 661 cays and 2387 rocks, and extends along a line from Florida on the northwest to Haiti on the southeast, between Cuba and the open Atlantic, over a distance of about 630 m., from 80° 50' to 72° 50' W., and 28° 25' to 26° 40' N. The total land area is estimated at 5450 sq. m., of which the main islands occupy 4424 sq. m., and the population was 43,521 in 1881 and 53,735 in 1901. Some 12,000 of these are whites, the remainder coloured. The main islands and groups, beginning from the northwest, are as follows: Little and Great Abaco, with Great Bahama to the west; Eleuthera (a name probably corrupted from the Spanish *Isla de Tierra*), Cat, Watling, or Guanahani, and Rum Cay on the outer line towards the open ocean, with New Providence, the Exuma chain and Long Island forming an inner line to the west. Further off to the west are the islands of Andros, governor of Massachusetts, &c., at the close of the 17th century; often spoken of as one island, but actually divided into several by narrow straits; and finally the Crooked Islands, Mayaguana and Inagua. The Turks and Caicos islands continue the outer line, and belong geographically to the archipelago, but not politically. The surrounding seas are shallow for the most part, but there are three well-defined channels—the Florida or New Bahama channel, between the north-western islands and Florida, followed by the Gulf Stream, the Providence channels (north-east and north-west) from which a depression known as the Tongue of Ocean extends southward along the east side of Andros, and the Old Bahama channel, between the archipelago and Cuba. The Andros islands have a length of 95 m. and an area of 1600 sq. m.; Great Abaco is 70 m. long and its area is 680 sq. m.; Great Inagua is 34 m. long with an area of 530 sq. m.
and Grand Bahama 66 m., with an area of 430 sq. m. But the most important island, as containing the capital, Nassau, is New Providence, which is only 108 m. in length, with 33 and 85 sq. m. This island supported a population in 1901 of 12,534. 

In point of population the next most important island is Eleuthera (87,332), followed by the Andros Islands (53,479) and Cat Island (46,580). The Abaco and Exuma groups and Long Island each support populations exceeding 3,000, and there are smaller populations on Grand Bahama, the Crooked Islands, Inagua, Mayaguana, Watling, Rum Cay and the Biminis, though these last, which are two very small north-western islands, are relatively densely populated with 545 persons.

Physical Geography.—The islands are of coral formation and low-lying. The rock on the surface is as hard as flint, but underneath it gradually softens and furnishes an admirable stone for building which can be sawn into blocks of any size, hardening on exposure to the atmosphere. The highest hill in the whole range of the islands (cat Island) is only 400 ft. high. It is a remarkable fact that, except in the island of Andros, no streams of running water are to be found in the whole group. The inhabitants derive their water supply from wells. As a result of the porosity of the rock, many of the wells feel the influence of the tides. There is a brackish lagoon in Eleuthera, the water of which is fresh or nearly so; and brackish lagoons also occur, as in Watling Island. An artificial lake in New Providence, constructed for the use of the turtle-catchers, is noted as exhibiting an extraordinary degree of phosphorescence. A remarkable natural phenomenon is that of the so-called "banana holes," which frequently occur in the limestone. Their formation has been attributed to the effect of rotting vegetation on the rock, but without certainty. These holes are of various depths up to about 40 ft., and of curiously regular form. The Mermaid's Pool in New Providence, which is deeper still, is partly filled with water.

Geology.—The Bahamas consist almost entirely of aeolian deposits (cf. BERMUDAS) and coral reefs. The aeolian deposits, which form the greater part of the islands, frequently rise in rounded hills and ridges to a height of 100 or 200 ft., and in Cat Island nearly 400 ft. They vary in texture from a fine-grained compact oolite to a coarse-grained rock composed of angular or rounded fragments, and they commonly exhibit strongly marked false stratification. This material is largely calcareous, and has probably been derived from the disintegration of the rock, and from the shells of animals living in the shallows. When freshly exposed the rock is soft, but by the action of rain and sea it becomes covered with a hard crust. The surface is often remarkably honeycombed, and the rock weathers into pinnacles, pillars and arches of extraordinary shapes. On the island of Andros there is an extremely fine white marl almost resembling a chalky ooze. The coral reefs are of especial interest from their bearing on the general question of the formation of coral reefs.

Nassau.—The scenery of the islands is picturesque, gaining beauty from the fine colouring of the sea and the rich vegetation. Nassau is a winter health-resort for many visitors from the United States and Canada. The town lies on a safe harbour on the north shore of New Providence, sheltered by the small Hog Island. There is a depth of 14 ft. at low-water spring-tide on the bar. The town extends along the shore, and up a slightly elevated ridge behind it. It contains the principal public buildings, and some interesting old forts, dating from the middle and close of the 18th century, though the subterranean works below Fort Charlotte belong to a earlier period. For the same century dates the octagonal building which, formerly a gaol, now contains a good public library. The sea-bathing is excellent. The months of February and March are the principal season for visitors. There is direct connexion with New York by steamers, which make the journey in about four days; and there is also connexion with Miami in Florida.

Climate, Flora, Fauna.—The climate of the Bahamas adds to their attractions. The mean temperature of the hottest months (June to September) is 88° F., and that of the coldest (January to March) 66°. In a series of observations of winds about one half have been found to indicate a direction from north-east or east. Hurricanes occur from July to October, and May to October are reckoned as the rainy months. The rainfall recorded in 1901 at Nassau amounted to 65·32 in. Where a mantle of soil covers the rock it is generally thin but very fertile. A well-defined area in New Providence is known as the "pine barrens," from the tree which principally grows in this rocky soil. Elsewhere three types of soil are distinguished—a black soil, of decayed vegetable matter, where the land is under forest, a reddish clay, and a white soil occurring along the shores. Andros Island and the Abaco Islands may be specially noted for their profusion of large timber, including mahogany, mastic, lignum vitae, iron and bullet woods, and many others. Unfortunately the want both of labour and of roads renders it impossible to turn much of this valuable timber to useful account, although attempts have been made to work it in Abaco. The fruits and spices of the Bahamas are very numerous, the fruit equaling any in the world. The produce of the islands includes tamarinds, olives, oranges, lemons, limes, citrons, pomegranates, pine-apples, figs, sapodillas, bananas, sour-sops, melons, yams, potatoes, gourds, cucumbers, pepper, cassava, prickly pears, sugar-cane, ginger, coffee, indigo, Guinea corn and pease. The caribou and cassarilla bark also furnish; and cotton is indigenous and grown on a limited scale. But although oranges, pine-apples and some other fruits form important articles of commerce, it is only rarely that systematic and thorough methods of cultivation are prosecuted. Cotton has been found to suffer much from insect pests. Sisal is grown in increasing quantity. The Bahamas are far poorer in their fauna than in their flora. It is said that the aborigines had a breed of dogs which did not bark, and a small coney is also mentioned. The guana also is indigenous to the islands. Ozen, sheep, horses and other live-stock introduced from Europe thrive well, but little attention is paid to stock-rearing. There are many varieties of birds to be found in the woods of the Bahamas; they include flamingoes and the beautiful hummingbird, as well as wild geese, ducks, pigeons, hawks, green parrots and doves. The waters of the Bahamas swarm with fish; the turtle procured there is particularly fine, and the sponge fishery is of importance. In some islands there are rich salt ponds, but their working has decreased. The portion of Nassau harbour known as the Sea Gardens exhibits an extraordinarily beautiful development of marine life.

Government, Trade, &c.—The colony of the Bahamas is under a British governor, who is assisted by an executive council of nine members, partly official, partly unofficial; and by a legislative council of nine members nominated by the crown. There is also a legislative assembly of 29 members, representing 15 electoral districts; the franchise being extended to white and coloured men of 21 years of age at least, resident in the colony for not less than twelve months, and possessing land of a value of £5 or more, or being householders for six months at a rental not less than £2 : 18s. in New Providence, or £1 : 4s. in other islands. The members' qualification is the possession of real or personal estate to the value of £200. The average annual revenue and expenditure may be set down at about £15,000, expenditure somewhat exceeding revenue. There is a public debt of about £105,000. The average annual value of imports is somewhat over £300,000, and of exports £500,000. The average annual tonnage of shipping, entering and clearing, exceeds 1,000,000. The government supports elementary free schools, controlled by a nominated board of education, while connexion partly of engineering development. There are higher schools and a Queen's College in Nassau. Nassau is the seat of a bishopric of the Church of England created in 1861. The Bahamas are without railways, but there are good roads in New Providence, and a few elsewhere. A cable connects Nassau with West Jupiter in Florida.

History.—The story of the Bahamas is a singular one, and bears principally upon the fortunes of New Providence, which, from the fact that it alone possesses a perfectly safe harbour for vessels drawing more than 9 ft., has always been the seat of
government when it was not the head-quarters of lawlessness. San Salvador, however, claims historical precedence of the land-fall of Columbus on his memorable voyage. The Cot Island, was long supposed to be the island first reached by Columbus (12th October 1492) and named him San Salvador. Then the distinction was successively transferred to the neighbouring Watling, Great Turk, and Marigua; but in 1880 the American marine surveyor, G. V. Fox, identified San Salvador, on seemingly good grounds, with Samana (Atwood Cay), which lies about midway between Watling and Marigua.

The chief difficulty is its size, for, if Samana is the true San Salvador, it must have been considerably larger than now. Watling Island is generally accepted as the land-fall. Columbus passed through the islands, and in one of his letters to Ferdinand and Isabella he said, "This country excels all others as far as the day surpasses the night in splendour; the natives love their neighbours as themselves; their conversation is the sweetest imaginable; their faces always smiling; and so gentle and so affectionate are they, that I swear to your highness there is not a better people in the world." But the natives, innocent as they appeared, were doomed to utter destruction. Ovando, the governor of Hispaniola (Haïti), who had exhausted the labours of that island, turned his thoughts to the Bahamas, and in 1505 Ferdinand authorized him to procure labourers from these islands. It is said that reverence and love for their departed relatives was a marked feature in the character of the aborigines, and some Spaniards made use of this as a bait to trap the unhappy natives. They promised to convey the ignorant savages in their ships to the "heavenly shores" where their departed friends now dwelt, and about 40,000 were transported to Hispaniola to perish miserably in the mines. From that date, until after the colonization of New Providence by the British, there is no record of a Spanish visit to the Bahamas, with the exception of the extraordinary cruise of Juan Ponce de Leon, the conqueror of Porto Rico, who passed months searching the islands for Bimini, which was reported to contain the miraculous "Fountain of Youth." This is in South Bimini, and has still a local reputation for healing powers.

It is commonly stated that in 1629 the British formed a settlement in New Providence, which they held till 1641, when the Spaniards expelled them. This, however, refers to the Providence Island off the Mosquito Coast; it was only in 1646 that Eleuthera was colonized, and in 1666 New Providence, by settlers from the Bermudas. In 1670 Charles II. made a grant of the islands to Christopher, duke of Albemarle, and others. Governors were appointed by the lords proprietors, and there are copious records in the state papers of the later years, to develop the resources of the territory. But the buccaneers of pirate islands, who had made their retreat here offered heavy opposition; in 1686 there was an attack by the Spaniards, and in July 1703 the French and Spaniards made a descent on New Providence, blew up the fort, spiked the guns, burnt the church and carried off the governor, with the principal inhabitants, to Havana. In October the Spaniards made a second descent and completed the work of destruction. It is said that when the last of the governors appointed by the lords proprietors, in ignorance of the Spanish raid, arrived in New Providence, he found the island without an inhabitant. It again, however, became the resort of pirates, and the names of many of the worst of these ruffians are associated with New Providence; the notorious Edward Teach, called Blackbeard, who was afterwards killed in action against two American ships in 1718, being chief among the number.

At last matters became so intolerable that the merchants of London and Bristol petitioned the crown to take possession and restore order, and Captain Woods Rogers was sent out as the first crown governor and arrived at New Providence in 1718. Many families of good character now settled at the Bahama group and some progress was made in developing the resources of the colony, although this was interrupted by the tyrannical conduct of some of the governors who succeeded Captain Woods Rogers. At this time the pine-apple was introduced as an article of cultivation at Eleuthera: and a few years subsequently, during the American war of independence, colonists arrived in great numbers, bringing with them wealth and also slave labour. Cotton cultivation was now attempted on a large scale. In 1783, at Long Island, 800 slaves were at work, and nearly 4,000 acres of land under cultivation. But the usual bad luck of the Bahamas prevailed; the red bug destroyed the cotton crops in 1788 and again in 1794, and by the year 1800 cotton cultivation was almost abandoned. There were also other causes that tended to retard the progress of the colony. In 1776 Commodore Hopkins, of the American navy, took the island of New Providence; he soon, however, abandoned it as untenable, but in 1781 it was retaken by the Spanish governor of Cuba. The Spaniards retained nominal possession of the Bahamas until 1783, but before peace was notified New Providence was recaptured by a loyalist, Lieutenant-Colonel Deveaux, of the South Carolina militia, in June 1783.

In 1784 and 1786 sums were voted in parliament to indemnify the descendants of the old lords proprietors, and the islands were formally reconveyed to the crown. The Bahamas began again to make a little progress, until the separation of Turks and Caicos Islands in 1848, which had been hitherto the most productive of the salt-producing islands, unfavourably affected the finances. Probably the abolition of the slave-trade in 1834 was not without its effect upon the formation of the Bahama Islands. The development of the sugar industry in the Bahamas was the rise of the blockade-running trade, consequent on the closing of the southern ports of America by the Federais in 1861. At the commencement of 1865 this trade was at its highest point. In January and February 1865 no less than 20 steamers arrived at Nassau, importing 14,182 bales of cotton, valued at £5,454,675. The extraordinary difference between the normal trade of the islands and that due to blockade-running will be seen by comparing the imports and exports before the closing of the southern ports in 1860 with those of 1864. In the first year the imports were £234,029, and the exports £157,350, while in the second year the imports were £5,346,112, and the exports £1,672,398. The excitement, extravagance and waste existing at Nassau during the days of blockade-running exceeded belief. Individuals may have profited largely, but the Bahamas probably benefited little. The government managed to pay its debt amounting to £43,786, but crime increased and sickness became very prevalent. The cessation of the trade was marked, however, by hardly any disturbance; there were no local failures, and in a few months the steamers and their crews departed, and New Providence subsided into its usual routine of trade. This, however, lasted only short time; for in October 1866 a most violent hurricane passed over the island, injuring the orchards, destroying the fruit-trees, and damaging the sponges, which had proved hitherto a source of profit. The hurricane, too, was followed by repeated droughts, and the inhabitants of the out-islands were reduced to indigence and want, a condition which is still, in some measure, in evidence.

BAHAWALPUR, or BHAWALPUR, a native state of India, within the Punjab, stretching for more than 300 m. along the left bank of the Sutlej, the Punjund and the Indus. It is bounded on the N. and E. by Sind and the Punjab, and on the S. by the Rajputana desert. It is the principal Mahomedan state in the Punjab, ranking second only to Patiala. Edward Thornton thus described the general aspect of the state:—

"Bahawalpur is a remarkably level country, there being no considerable eminence within its limits, as the occasional sand-hills, seldom exceeding 30 or 60 ft. in height, cannot be considered exceptions. The cultivated part extends along the river line for a distance of about 10 m. in breadth from the left or eastern bank. In the
sandy part of the desert beyond this strip of fertility both men and beasts, leaving the beaten path, sink as if in loose snow. Here, too, the sand is raised into ever-changing hills by the force of the wind sweeping over it. In those parts of the desert which have a hard level soil of clay, a few stunted mimusas, acacias and other shrubs are produced, together with rue, various bitter and aromatic plants, and occasionally tufts of grass. Much of the soil of the desert appears to be alluvial; there are numerous traces of streams having formerly passed over it, and still there is irrigation at all practicable, fertility in the clayey tract follows: but the rains are scanty, the wells few and generally 100 ft. deep or more.

The area covers 15,918 sq. m.; pop. (1901) 720,877, showing an increase of 11% on the previous decade; estimated gross revenue, £146,700; there is no tribute. The chief, whose title is nawab, is a Mahomedan of the Daudputra family from Sind, and claims descent from Abbas, uncle of the Prophet. The dynasty established its independence of the Afghans towards the end of the 18th century, and made a treaty with the British in 1838 to which it has always been loyal. The benefits of canal irrigation were introduced in the seventies, and the revenue thus doubled. The territory is traversed throughout its length by the North-Western and Southern Bengal railways. There are also numerous native and Muhammadan schools.

The town of Bawalpur is situated near the left bank of the Sutlej, and has a railway station 65 m. from Mooltan. It has a magnificent palace, which is visible from far across the Bikaner desert; it was built in 1882 by Nawab Sadik Mahommed Khan. Pop. (1901) 18,546.

BAHIA, an Atlantic state of Brazil, bounded N. by the states of Piauí, Pernambuco and Sergipe, E. by Sergipe and the Atlantic, S. by Espirito Santo and Minas Gerais, and W. by Minas Geraes and Goiay. Its area is 164,650 sq. m., a great part of which is an arid barren chapada (plateau), traversed from S. to N. and E. by the drainage basin of the São Francisco river, and having a general elevation of 1000 to 1700 ft. above that river, or 2300 to 3000 ft. above sea-level. On the W. the chapada, with an elevation of 2300 ft. and a breadth of 60 m., forms the western boundary of the state and the water-parting between the São Francisco and the Tocantins. East of the São Francisco it may be divided into three distinct regions: a rough limestone plateau rising gradually to the culminating ridges of the Serra da Chapada; a gently sloping plateau showing extensive exposure of bare rock dipping slightly toward the coast; and a narrower plateau covered with a compact sandy soil descending to the coastal plain. The first two have a breadth of about 200 m. each, and are arid, barren and inhospitable, except at the dividing ridges where the clouds from the sea are deprived of some of their moisture. The third zone loses its arid character as it approaches the coast, and is better clothed with vegetation. The coastal plain varies in width and character: in some places low and sandy, or swampy, filled with lagoons and intersecting canals; in others more elevated, rolling and very fertile. The climate corresponds closely to these surface features, being hot and dry throughout the interior, hot and humid, in places unhealthy, along the coast. Cattle-raising was once the principal industry in the interior, but has been almost extinguished by the devastating droughts and increasing aridity caused by the custom of annually burning over the campos to improve the grass. In the agricultural regions sugar, cotton, tobacco, cacao, coffee, mandioca and tropical fruits are produced. The exports also include hides, mangabeira rubber, piaussa fibre, diamonds, cabinet woods, and tobacco. The population is largely of a mixed and unprogressive character, and numbered 1,910,892 in 1890. There is but little immigration and the vegetative increase is low.

The capital, São Salvador or Bahia (q.v.), which is one of the principal cities and ports of Brazil, is the export town for the Recôncavo, as the fertile agricultural district surrounding the bay is called. The principal cities of the state are Alagoinas and Bom Fim (formerly Villa Nova da Rainha) on the main railway line running N. to the São Francisco, Caçoeira and Santo Amaro near the capital in the Recôncavo, Caravelas and Ilheos on the southern coast, with tolerably good harbours, the former being the port for the Bahia & Minas railway, Feira de Santa Anna on the border of the serró and long celebrated for its cattle fair, and Jacobina, an inland town N.W. of the capital, on the slopes of the Serra da Chapada, and noted for its mining industries, cotton and tobacco. The state of Bahia includes four of the original captaincies granted by the Portuguese crown—Bahia, Paraguassu, Ilheos and Porto Seguro, all of which reverted to the direct control of that government in 1549. During the war with Holland several efforts were made to conquer this captaincy, but without success. In 1823 Bahia became a province of the empire, and in 1889 a state in the republic. Its government consists of a governor elected for four years, and a general assembly of two chambers, the senators being elected for six years and the deputies for two years.

BAHIA, or SÃO SALVADOR, a maritime city of Brazil and capital of the state of Bahia, situated on the Bay of All Saints (Bahia de Todos os Santos), and on the western side of the peninsula separating that bay from the Atlantic, in 13° S. lat. and 38° 30' W. long. Pop. (1890) 174,412; (est. 1900) 200,000. The commercial section of the city occupies a long, narrow beach between the water-line and bluffs, and contains the arsenal, exchange, custom-house, post-office, railway station, market and principal public buildings. It has numerous hotels, churches and other buildings and made still more dirty and offensive by the surface drainage of the upper town. Communication with the upper town is effected by means of two elevators, a circular tramway, and steep zigzag roads. The upper town is built on the western slope of a low ridge, the backbone of the peninsula, and rises from the edge of the bluffs to altitudes of 200 to 260 ft. above the sea-level, affording magnificent views of the bay and its islands. There are wider streets, comfortable residences, and attractive gardens in this part of the city. Here also are to be found the churches, schools, theatres, asylums, and hospitals, academies of law and medicine, governor's palace, public library, and museum, and an interesting public garden on the edge of the bluff, overlooking the bay. The city is served by four street-car lines, connecting the suburbs with both the upper and lower towns. In 1906 contracts were made to reconstruct some of these lines for electric traction. The railways radiating from the city to inland points are the Bahia & Alagoinas which is under construction to Joaçatuba, the São Francisco river, a short line to Santo Amaro, and a long line to a deep well-sheltered bay extending inland from points on the opposite side of the bay.

The port of Bahia, which has one of the best and most accessible harbours on the east coast of South America, has a large coastwise and foreign trade, and is also used as a port of call by most of the steamship lines trading between Europe and that continent. Bahia was founded in 1549 by Thomé de Souza, the first Portuguese governor-general of Brazil, and was the seat of colonial administration down to 1763. It was made the seat of a bishopric in 1551, and of an archbishopric in 1676, and until 1905 was the metropolis of the Roman Catholic Church in Brazil. The city was captured in 1624 by the Dutch, who held it only a few months. Always conservative in character, the city hesitated in adhering to the declaration of independence in 1822, and also to the declaration of the republic in 1889. Much of its commercial and political importance has been lost, also, through the decay of industrial activity in the state, and through the more vigorous competition of the agricultural states of the south.

BAHIA BLANCA, a city and port of Argentina, on the Necochea Railway, 80 m. from the outlet into a deep well-sheltered bay of the same name. Pop. (est. 1903) 11,500. It is situated in the extreme southern part of the province of Buenos Aires and is 447 m. by rail S.W. of the national capital. The opening to settlement of the national territories of La pampa and Neuquén has contributed largely to the growth and importance of Bahia Blanca. It is the natural shipping-port for these territories and for the southern districts of the province of Buenos Aires, from which great quantities of wheat and wool are exported. The bay has long been recognized as one of the best on the Argentine coast, and when the channel is properly dredged, will admit steamers of 30 ft. draught at low-water. The Argentine government has located its principal naval station here, at the
Puerto Militar, between the city and the entrance to the bay. The port, whose trade is increasing rapidly, is connected with the neighbouring and interior producing districts by five or six lines of railway and their branches. Bahia Blanca dates from 1828, when a fort and trading post were located here, but its development as a commercial centre began only in 1885, when its first railway line was opened. In 1908 direct railway communication was opened with Mendoza and San Juan. Though situated near the mountains, the vicinity of the city is low and swampy, it has been decided unhealthily; but water supply from the Sauce Grande, 50 m. distant, was projected in 1906, and this, with better drainage and street paving, was expected to improve matters. The mean annual temperature is 60°, and the average annual rainfall is 19 in. The city has street cars, electric-lights and telephone service, and the port has a shipping pier 1640 ft. long, with spacious warehouses and several miles of railway sidings.

BAHR, the Arabic for "sea," with the diminutive bahr. Bahar also signifies a river, especially one with a large body of water, e.g. the Nile, and is sometimes used to designate the dry bed of a river.

BAHRAICh or BHARAICh, a town and district of British India, situated in the Fyzabad division of the United Provinces. The town is on the river Sarju. Since the opening of the railway the place has begun to flourish. It contains the most popular place of pilgrimage in Oudh, the tomb of Masaud, a champion of Islam, slain in battle by the confederate Rajputs in 1033, which is resorted to by Mahomedans and Hindus alike. There is also a Mussulman monastery, and the ruined palace of a nawab of Oudh. The American Methodists have a mission here. Pop. (1901) 27,304.

The district of Bahraich contains an area of 2647 sq. m. It consists of three tracts: (1) in the centre, an elevated triangular plateau, projecting from the base of the Himalayas for about 50 m. in a south-easterly direction—average breadth, 13 m., area, 670 sq. m.; (2) the great plain of the Gogra, on the west, about 40 ft. below the level of the plateau; and (3) on the east, another lesser area of depression, comprising the basin of the Rapti. The 'tara', or the forest and marshy tracts along the southern slopes of the Himalayas, gradually merge within the district into drier land, the beds of the streams become deeper and more marked, the marshes disappear, and the country assumes the ordinary appearance of the plain of the Ganges. The Gogra skirts the district for 114 m. and the Rapti, with its branch the Bhalka, drains the high grounds. In 1901 the population was 1,051,347, showing an increase of 5% in the decade. A considerable trade is conducted with Nepal, chiefly in timber. A line of railway has been opened through the district to Nepalganj on the frontier. As there are no canals in the district, irrigation is obtained solely from wells, tanks and rivers. The district is purely agricultural in character, and is one of large estates, 75% being held by taluqdars, of whom the four chief are the rajahs of Karupathala, the maharaja of Balrampur, the raja of Nanpara and the raja of Payagpur. Little is known of the history of the district before the Mahomedans. In 1033 Bahraich was defeated and slain by the nobles of Bahraich in 1033, and the Mahomedans did not establish their authority over the country till the middle of the 13th century. About 1250 the Kalwalks, or Rajput adventurers, made themselves masters of the western portion of the district, which they retain to this day. In 1816 by the treaty of Sagarul the Nepal tarai was ceded to the British, but was given back in 1860. During the Mutiny the district was the scene of considerable fighting, and after its close a large portion was distributed in jagirs to loyal chiefs, thus originating the taluqdari estates of the present day.

BAHRAM (Varahrān, in Gr. O δραγον Oδραγον, the younger form of the old Vērēhrānu, the name of a Persian god, "the killer of the dragon Verethra"), the name of five Sassanian kings. 1. BAHRAM I. (A.D. 274–277). From a Pahlavi inscription we learn that he was the son (not, as the Greek authors and Tabari say, the grandson) of Shapur I., and succeeded his brother Hormizd (Ormizd) I., who had only reigned a year. Bahram I. is the king who, by the instigation of the magians, put to a cruel death the prophet Mani, the founder of Manichaeism. Nothing else is known of his reign.

2. BAHRAM II. (277–294), son of Bahram I. During his reign the emperor Caurus attacked the Persians and conquered Ctesiphon (283), but died by the plague. Of Bahram II.'s reign some theological inscriptions exist (F. Stolze and J. C. Andreas, Persepolis (Berlin, 1882), and E. W. West, "Pahlavi Literature" in Grundriss d. iranischen Philologie, ii. pp. 75-120).

3. BAHRAM III., son of Bahram II., under whose rule he had been governing Sejistan (therefore called Saganshah, Agathias iv. 24, Tabari). He reigned only four months (294), and was succeeded by the pretender Narses.

4. BAHRAM IV. (385–399), son and successor of Shapur III., under whom he had been governor of Kirmān; therefore he was called Kirmanshah (Agathias iv. 26, Tabari). Under him or his predecessor Armenia was divided between the Roman and the Persian empire. Bahram IV. was killed by some mounted lancers.

5. BAHRAM V. (420–439), son of Yazdegord I., after whose sudden death (or assassination) he gained the crown against the opposition of the grandees by the help of al-Mondhir, the Arabic dynast of Hira. He promised to rule otherwise than his father, who had been very energetic and at the same time tolerant in religion. So Bahram V. began a systematic persecution of the Christians, which led to a war with the Roman empire. But he had little success, and soon concluded a treaty by which both empires promised toleration to the worshippers of the two rival religions, Christianity and Zoroastrianism. Bahram disposed the vassal king of the Persian part of Armenia and made it a province. He is a great favourite in Persian tradition, which relates many stories of his valour and beauty, of his victories over the Romans, Turks, Indians and Negroes, and of his adventures in hunting and in love; he is called Bahram Gor, "the wild ass," on account of his strength and courage. In reality he seems to have been rather a weak monarch, after the heart of the grandees and the priests. He is said to have built many great fire-temples, with large gardens and villages (Tabari).

BAHRDT, KARL FRIEDRICH (1741–1792). German theologian and adventurer, was born on the 25th of August 1741 at Bischofswerda, where his father, afterwards professor, canon and general superintendent at Leipzig, was pastor. At the age of sixteen young Bahrdt, a precocious lad whose training had been grossly neglected, began to study theology under the orthodox mystic, Christian August Crusius (1715–1775), who in 1757 had become first professor in the theological faculty. The boy varied the monotony of his studies by pranks which revealed his unbalanced character, including an attempt to raise spirits with the aid of Dr Faust's Hollenwoang. His orthodoxy was, however, unimpeachable, his talent conspicuous, and in 1761 he was appointed lecturer on biblical exegesis, and preacher (Katholik) at the church of St Peter. His eloquence soon gave him a reputation, and in 1766 he was appointed professor extraordinary of biblical philology. Two years later, however, the scandals of his private life led to his dismissal. In spite of this he succeeded in obtaining the chair of biblical antiquities in the philosophical faculty at Erfurt. The post was unpaid, and Bahrdt, who had now married, lived by taking pupils and keeping an inn. He had meanwhile obtained the degree of doctor of theology from Erlangen, and was clever enough to persuade the Erfurt authorities to appoint him professor designate of theology. His financial troubles and coarse and truculent character, however, soon made the town too hot to hold him; and in 1771 he was glad to accept the offer of the post of professor of theology and preacher at Giessen.

Thus far Bahrdt's orthodoxy had counterbalanced his character; but at Giessen, where his behaviour was no less objectionable than elsewhere, he gave a handle to his enemies by a change
in his public attitude towards religion. The climax came with the publication of his Neueste Oeffnung Gottes in Briefen und Erkluungen (1773-1775), purporting to be a "model version" of the New Testament, rendered, with due regard to enlightenment, into modern German. The book is remembered solely through Goethe's scornful attack on its want of taste; its immediate effect was to produce Bahrdt's expulsion from Giessen. He was lucky enough at once to find a post as principal of the educational institution established in his chateau at Marschlin by the Swiss statesman Ulysses von Salis (1728-1800). The school had languished since the death of its founder and first head, Martin Planta (1727-1772), and von Salis hoped to revive it by reconstituting it as a "Philanthropin" under Bahrdt's management. The experiment was a failure; Bahrdt, never at ease under the strict discipline maintained by von Salis, resigned in 1777, and the school was closed. At the invitation of the count of Leiningen-Dachsburg, Bahrdt now went as general superintendent to Dürkheim on the Härdt; his luckless translation of the Testament, however, pursued him, and in 1778 he was suspended by a decision of the high court of the Empire. In dire poverty he fled, in 1779, to Halle, where in spite of the opposition of the senate and the theologians, he obtained through the interest of the Prussian minister, von Zedlitz, permission to lecture on subjects other than theology. Forced to earn a living by writing, he developed an astounding literary activity. His orthodoxy had now quite gone by the board, and all his efforts were directed to the propaganda of a "moral system" which should replace supernatural Christianity.

By such means Bahrdt succeeded in maintaining himself until, on the death of Frederick the Great, the religious reaction set in at the Berlin court. The strain of writing had forced him to give up his lectures, and he had again opened an inn on the Weinberg near Halle. Here he lived with his mistress and his daughters—he had repudiated his wife—in disreputable peace until 1789, when he was condemned to a year's imprisonment for a lampoon on the Prussian religious edict of 1788. His year's enforced leisure he spent in writing indecent stories, coarse polemics, and an autobiography which is described as "a mixture of lies, hypocrisy and self-prostitution." He died on the 23rd of April 1792.

*See life, with detailed bibliography, by Paul Tschakert in Herzog-Haus, vol. 4 (1851), a more facsimile account is given in J. M. Robertson's Short History of Freethought, il. 278.*

**BAHREIN ISLANDS.** A group of islands situated about 20 m. east of the coast of El Hasa, in the Persian Gulf, a little to the south of the port of El Katif, which, if rightly identified with the ancient Gerrha, has been celebrated throughout history as the mart of Indian trade, the starting-point of caravans across Arabia. The largest of the group is called Bahrein. It is about 27 m. long from north to south and about 10 wide—a low flat space of sandy waste with cultivated oases and palm groves of great luxuriance and beauty. The rocky hill of Jebel Dukhan (the "mountain of the mist") rises in the midst of it to a height of 400 ft. The rest of the group are of coral formation. The next island in size to Bahrein is Moharik, curved in shape, and about 5 m. long by ½ m. in breadth. It lies 1 m. to the north of Bahrein. Sitrak (4 m. long) Nebbi, Saleh, Sayeh, Kasheieh and Arad (1 m. long) complete the group. Of these minor islands Arad alone retains its classical name.

The climate is mild, but humid, and rather unhealthy. The soil is the most part fertile, and produces rice, pot herbs and fruit of various kinds. Water is abundantly. Fish of all kinds abound off the coast, and are widely used in the markets. The inhabitants are a mixed race of Arab, Omanite and Persian blood, slender and small in their physical appearance; they possess great activity and intelligence, and are known in all the ports of the Persian Gulf for their commercial and industrial ability.

The sea around the Bahrein islands is shallow, so shallow as to admit only of the approach of native craft, and the harbour is closely shut in by reefs. There is very little doubt that it was from these islands that the Puni, or Phoenicians, emigrated northwards to the Mediterranean. Bahrein has always been the centre of the pearl fishing industry of the Persian Gulf. There are about 500 boats now employed in the pearl fisheries, each of them paying a tax to the Sheik. The pearl export from Linja is valued at about £30,000 to £35,000 per annum.

The capital town of Bahrein is Manameh, a long, straggling, narrow town of about 8000 inhabitants, chiefly of the Wahabi sect. Manameh is adjacent to the most northern point of the island, and looks across the narrow strait to Moharik.

Fish and sea-weed form the staple food of the islanders. The water-supply of Moharik is probably unique. It is derived from springs which burst through the beds below sea-level with such force as to retain their freshness in the midst of the surrounding salt water. Scattered through the islands are some fifty villages, each possessing its own date groves and cultivation, forming features in the landscape of great fertility and beauty. Most of these villages are walled in for protection.

The Portuguese obtained possession of the islands in 1507, but were driven from their settlements in that quarter by Shah Abbas in 1622. The islands afterwards became an object of contention between the Persians and Arabs, and at last the Arabian tribe of the Athubis made themselves masters of them in 1764.

The present Sheik of Bahrein (who lives chiefly at Moharik) is of the family of El Kalifa. This ruling race was driven from the mainland (where they held great possessions) by the Turks about 1850. In the year 1867 the Persians threatened Bahrein, and in 1875 the Turks laid their hands on it. British interference in both cases was successful in maintaining the integrity of Arab rule, and the Bahrein islands are now under British protection.

To the south-west of the picturesque belts of palm trees which stretch inland from the northern coast of Bahrein, is a wide space of open sandy plain filled with gigantic tumuli or earth mounds, of which the outer layers of gravel and clay have been hardened by the weather action of centuries to the consistency of conglomerate. Within these mounds are two-chambered sepulchres, built of huge slabs of limestone, several of which have been opened and examined by Durand, Bent and others, and found to contain relics of undoubted Phoenician design. Scattered here and there throughout the islands are isolated mounds, or smaller groups, all of which are of the same appearance, and probably of similar origin.

**BAHR-EL-GHAZAL,** the chief western affluent of the river Nile, is in Africa, which it joins in 9° 30' N., 30° 25' E. The Bahr-el-Gazal (Gazelle river) is a deep stream formed by the junction of many rivers which rise in the mountains of the Mozambique and is the most important. The basin of the Gha katıl is a large one, extending north-west to Darfur, and south-west to the Congo watershed. The main northern feeder from the Gha想知道 is a large river, whose waters are in the country west of 24° E. where the Nile, Congo and Shari watersheds meet. Reinforced by intermittent streams from the hills of Darfur and by considerable rivers flowing north from Dar Ferti, this river after reaching as far north as about 10° 30' pursues a general south-eastern direction until it joins the Gha想知道 87 m. above the Deleb confluence (see below). This main northern feeder passes through the country of the Homr Arabs and Bahr-el-Homr may be adopted as its name. On many maps it is marked as the Bahr-el-Arab, a designation also used as an alternative name for the Lol 4 another tributary of the Gha想知道, which eventually unites with the Bahr-el-Homr. The Bahr-el-Homr in its lower reaches was in 1906 completely blocked by sodd (q.v.), and then brought no water into the Bahr-el-Gazal. The Sudan government, however, sent engineering parties to remove the sodd blocks and open out a continuous waterway. This Bahr-el-Homr is the only affluent of importance.

The Lol is also called the Kir, a name given likewise to the lower course of the Bahr-el-Homr. The confusion of names is partly attributable to the fact that each tribe has a different name for the same stream. It is also due in part to the belief that there was a large river flowing between the Bahr-el-Homr and the Lol. This third river, generally called the Kir, has proved to be only the lower course of the Lol or Bahr-el-Arab.
importance which has tributaries coming from north of the main stream; the rest of the very numerous affluents have their rise in the hilly country which stretches from Albert Nyanza in a general north-west direction as far as 25° E., and forms the watershed between the Nile basin and that of the Congo.

The most westerly is the Lol or Bahr-el-Arab. It rises, as the Boror or Telgona, in Dar Fertit, and receives from the south and south-west the Rags, Sopo, Chel and Bongo. Domo Zobeir, formerly the chief station of Zobeir Rahama (q.v.), is near the Birii tributary of the Chel, in 7° 40' N., 26° 10 E. The Lol maintains a fairly straight course east to about 28° E., when it turns north-east, and in about 28° 9' E., 9° 35' N., joins the Bahr-el-Hom. The chief of the southern affluents, and that tributary of the Ghazal which contributes the largest volume of water, is the Jur, known in its upper course as the Sue, Sve or Souch. The Sue rises north of 4° N. in about 26° E., within three or four days' journey of the navigable waters of the Mboomu, a northern sub-tributary of the Congo. After flowing north for several hundred miles the Sue, now the Jur, is joined on the left bank, in about 7° 30' N., 28° E., by the Wau, a considerable river whose headwaters are west of those of the Sue. The united stream now turns east and joins the Ghazal through a lake-like expansion (see below). The town of Wau (7° 42' N., 28° 3' E.), on the Jur, is the capital of the Bahr-el-Ghazal province of the Anglo-Egyptian Sudan. Meshraer-Rek, the chief station and trading centre of the first European visitors to the country, is on a backwater south of this lake. Between the Jur and the Nile, and following a course generally parallel with these rivers, several streams run north from the Congo-Nile watershed and join the Bahr-el-Ghazal. The Tonji, the most westerly of these rivers, joins the Jur a little above its confluence with the Ghazal. The Rohi (or Yalo), farther east, empties into a wide channel known as Khor Deleb, which joins the Ghazal some 9 m. above Lake No, and from the confluence the stream is known as the Deleb. Lake No is little more than a depression into which the waters of the Ghazal system pass near the point of junction with the Bahr-el-Jebel. The lake is about 7 m. long from west to east, and the Bahr-el-Jebel, after passing through its eastern corner, changes its name to Bahr-el-Ahmad or White Nile.

In their upper courses all the southern affluents of the Ghazal flow across a plateau of ferruginous laterite, their valleys having steep banks. North of 7° 25' N. (where rapids interrupt the currents) the valleys open out and the rivers wind in tortuous channels often choked by sandbanks. This alluvial region, flooded in the rainy season, gives place about 9° N. to a sea of swamps, forming in fact part of the huge swamp region of the Nile (q.v.). Through these swamps it is almost impossible to trace the course of the various rivers. The Bahr-el-Ghazal itself is described as a drainage channel rather than a true river. From the confluence of the Lol with the Jur, above which point none of the rivers is called Bahr-el-Ghazal, to the junction with the Nile at Lake No, is a distance of about 200 m. Just above the Lol confluence the Jur broadens out and forms a lake (Ambadi) 10 m. long and over a mile broad at low water and very much larger in flood time. This lake is the home of many huge swifts of the "swimming" variety—papous and ambach are absent. The Balanocetes res, elsewhere rare, is found here in large numbers. At first the Ghazal flows north with lagoon-like expansions having great breadth and little depth—nowhere more than 20 ft. Turning north-east the channel becomes narrower and deeper, and is characterized by occasional reaches of papyrus. Finally, the Ghazal turns east and again becomes broader until Lake No is reached. As a rule the banks in this section are marked by anthills and scrub. The anthills in one valley are so close together "that they somewhat resemble a gigantic graveyard" (Sir William Garstin). The rise of the Ghazal river in flood time is barely 3 ft., a depth sufficient, however, to place an enormous area of country under water.

**Exploration of the River.**—Rumours of the existence of the Bahr-el-Ghazal led some of the Greek geographers to imagine that the source of the Nile was westward in the direction of Lake Chad. The first map on which the course of the Ghazal is indicated with anything like accuracy is that of the French cartographer d'Anville, published in 1772. The exploration of the river followed the ascent of the White Nile and the Egyptian expeditions of 1830-1842. For a considerable portion of the period between 1853 and 1865 John Petherick, a Welshman, originally a mining engineer, explored the Ghazal region, particularly the main stream and the Jur. In 1859 a Venetian, Giovanni Miani, penetrated the southern regions of the Ghazal basin and was the first to bring back reports of a great river (the Welle) flowing west beyond the Nile watershed. In 1862 a Frenchman named Lejean surveyed the main river, of which he published a map. In 1863 Miss Alexandrine Tinné (q.v.) with a large party of friends and scientists ascended the Ghazal with the intention of seeing how far west the basin of the Nile extended. The chief scientists of the party were the Germans, Theodor von Heuglin and Hermann Steudner. Considerable additions to the knowledge of the region were made by this expedition, five out of the nine white members of which died from blackwater fever.1

Ghazal (q.v.) between 1869 and 1871 traversed the whole of the southern district, and crossing the watershed discovered the Nile. We are indebted to them for the first effort to destroy the slave trade in the Ghazal province led (1871-1873) by Colonel Gossens. In the further exploration of the river and its tributaries by Gossens, F. G. Gordon, the Italian governor under General C. G. Gordon. Wilhelm Junker (q.v.) about the same period also explored the southern tributaries of the Ghazal. These were carefully surveyed, and the Jur (Sue) followed throughout its course by Lieutenant A. H. Dyé and other members of the French mission under Colonel (then Captain) J. B. Marchand, which crossing from the Congo (Oct. 1897) reached Fashoda on the White Nile in July 1898.

Like the Bahr-el-Jebel the Bahr-el-Ghazal is liable to be choked by sudd. Gossens was imprisoned in it for some six weeks. The river became almost blocked by the accumulation of this obstruction during the rule of the Mahdists. In 1901 and following years the sudd was removed by British officers from the Bahr-el-Ghazal, the Jur and other rivers. Uninterrupted steamboat communication was thus established during the flood season between Khartoum and Wau, a distance of some 900 m. In 1895-1905 K. C. Bayldon, a British naval officer, Capt. C. Percival and Lieut. D. Comyn explored the northern and western affluents of the Ghazal, and threw some light on the puzzling hydrography and nomenclature of those tributaries.

See *Nile* and the authorities there quoted, especially Sir William Garstin's *Report upon the Basin of the Upper Nile, Egypt, No. 2* (1904), and Capt. H. G. Lyon's *The Physiography of the River Nile and its Basin* (Cairo, 1906); also *The Geographical Journal*, vol. xxx. (1907).

**BAHUT—BAHYA**

1 Including Miss Tinné's mother and aunt and Dr Steudner.
BAIAE—BAÏF

The Law, in the rabbinical sense, was revered by Babya, and he converted it into part and parcel of the Jew’s inner life. The book is divided into ten parts—the Unity of God; Contemplation; Worship; Trust; Consecration; Humility; Repentance; Self-Examination; the Ascetic Life; the Love of God. Some selections from Babya’s work have been rendered into English by E. Collins.

G. B. de Rossi in Notizia degli scavi, 1888, 709.) At Babai, Pompey and Hortensius possessed villas, the former on the hills, while that of the latter, on the shores of the Lacus Lucrinus, was remarkable for its tame lampreys and as the scene of the dialogue in the second book of Cicero’s Academia Priora; it afterwards became imperial property and was the scene of Agrippina’s murder by Nero. It was from Bauli to Puteoli that Caligula built his bridge of boats.

Of the once splendid villas and baths of Bauli and its district, the foundations of which were often thrown far out into the sea, considerable, though fragmentary, remains exist. It is not, as a rule, possible to identify the various buildings, and the names which have been applied to the ruins are not authenticated. At Bauli itself there exist three large and lofty domed buildings, two octagonal, one circular, and all circular in the interior, of opus reticulatum and brick, which, though popularly called temples, are remains of baths or nymphaeum. The Punta dell’ Epitaflìo also is covered with remains, while at Bauli are several ruins—north of the village a small theatre, called the tomb of Agrippina; under the village the remains of a large villa; and to the E. the remains of a large water reservoir, the so-called Cento Camerelle; to the S. another with a vaulted ceiling, known as the piscina mirabilis, measuring 230 by 85 ft. The villa of Marius, which was bought by Lucullus, and afterwards came into the possession of the imperial house, was the scene of the death of Tiberius. It is sometimes spoken of as Babai, sometimes as Misenumis, and is perhaps to be sought at Bauli (Th. Mommsen in Corp. Inscrip. Latin., x., Berlin, 1883, 1748), though Beloch inclines to place it on the promontory S. of Misenum, and this perhaps agrees better with the description given by Phaedrus.

Baïf, Jean Antoine de (1532–1589), French poet and member of the Pléiade, was born at Venice in 1532. He was the natural son of the scholar Lazare de Baïf, who was at that time French ambassador at Venice. Thanks, perhaps, to the surroundings of his childhood, he grew up an enthusiast for the fine arts, and surpassed in zeal all the leaders of the Renaissance in France. His father spared no pains to secure the best possible education for his son. The boy was taught Latin by Charles Estienne, and Greek by Ange Vergèce, the Cretan scholar and calligraphist who designed Greek types for Francis I. When he was eleven years old he was put under the care of the famous Jean Daurat (q.v.). Ronsard, who was eight years his senior, now began to share his studies. Claude Binet tells how young Baïf, fond on Latin and Greek, showed out the tiresome beginnings of the Greek language for Ronsard, who in return initiated his companions into the mysteries of French versification. Baïf possessed an extraordinary facility, and the mass of his work has injured his reputation. Besides a number of volumes of short poems of an amorous or congratulatory kind, he translated or paraphrased various pieces from Bion, Moschus, Theocritus, Anacreon, Catullus and Martial. He resided in Paris, and enjoyed the continued favour of the court. He founded in 1567 an académie de musique et de poésie,1 with the idea of establishing a closer union between music and poetry; his house became famous for the charming concerts which he gave, to amuse entertainments at which Charles IX. and Henry III. frequently flattered him with their presence. Baïf elaborated a system for regulating French versification by quantity. In this he was not a pioneer. Jacques de la Taille had written in 1560 the Menestriers de faire des vers francais commode en grec et en latin (printed 1573), and other poets had made experiments in the same direction. The 16th-century poets did not realize the

1 For an account of this academy see Édouard Frémy, Les Origines de l’Académie Française (1887).
incompatibility of the system of quantity with French rhythm. Balf's innovations included a line of 15 syllables known as the vers baïf. He also mediated reforms in French spelling. His theories are exemplified in *Étrennes de poésie Françoise au vers mesures* (1514). His works were published in 4 volumes, entitled *Œuvres en rime* (1553), consisting of Amours, Jeux, Passétemps, et Poèmes, containing, among much that is now hardly readable, some pieces of infinite grace and delicacy. His sonnet on the *Roman de la Rose* was said to contain the whole argument of that celebrated work, and Colletet says it was on everybody's lips. He also wrote a celebrated sonnet in praise of the massacre of Saint Bartholomew. Balf was the author of two comedies, *L'Enuange*, 1565 (published 1573), a free translation of Terence, and *Le Brave* (1567), an imitation of the *Miles Gloriosus*, in which the characters of Plautus are turned into Frenchmen, the action taking place at Orleans. Balf published a collection of Latin verse in 1577, and in 1576 a popular volume of *Mimes, enseignemens et proverbes*. He died in 1589. His father, Lazare de Balf,1 published a translation of the *Electra* of Sophocles in 1537, and afterwards a version of the *Icuba*; he was also the author of Latin verse, and is commended by Joachim Passetemps, as having introduced certain valuable words into the French language.

**BAIKAL** (known to the Mongols as Dalai-nor, and to the Turkish tribes as Bai-kul), a lake of East Siberia, the sixth in size of all the lakes of the world and the largest fresh-water basin of Eurasia. It stretches from S.W. to N.E. (51° 29' to 55° 50' N. lat. and 105° 42' to 107° 42' E. long.), separating the government of Irkutsk from that of Transbaikalia, and has a length of 386 m. and a width of from 20 m. to 50 m. Its southern extremity penetrates into the high plateau of Asia, and the lake lies entirely in the Alpine zone which fringes that plateau on the north-west. Its area is 13,200 sq. m., i.e. nearly as great as Switzerland. The length of its coast-line is 525 m. along the western, and 640 m. along the eastern shore. Its altitude has been estimated at 1587 ft. (Chersky) and at 1679 ft. (Sues)—118 ft. above the level of the Angara at Irkuts (Zapiiski Russ. Geog. Soc. xxv., 1885); but 1500 ft. would seem to be a more correct altitude (Izvestia Est Sib. Branch, xxvii. 1, 1897). Its level is subject to slight oscillations, and after a heavy five weeks' rain in 1869 it rose 7 ft., an immense territory at the mouth of the Selenga being submerged.

A hydrographic survey of this lake was made by Drizenko in 1897–1902. The elongated hilly island of Olkhon, and the peninsula of Svaytol Nos, which forms its continuation on the opposite eastern shore, divide the lake into two basins. The deepest part is in the south-east, at the foot of the Khamar-daban border-range of the high plateau. An elongated trough, 66 m. long, reaches there a depth of over 600 fathoms, with a maximum depth of 880 fathoms, i.e. about 5280 ft. below the level of the ocean. As a rule the bottom of the lake has very steep slopes: the 100-fathom and even the 250-fathom lines run close to the shores, that is to say, the steepness of the surrounding mountains (4600 to 6000 ft.) continues beneath the surface. At the mouth of the Selenga, however, which enters from the south-east, pouring into it the waters and the alluvial deposits from a drainage area of 373,500 sq. m., a wide delta is thrust out into the lake, reducing its width to 20 m. and spreading under its waters, so as to leave only a narrow channel, 230 to 247 fathoms deep, along the opposite coast. The depth of the middle portion of the lake has not yet been measured, but must exceed 500 fathoms. It was expected that an underground ridge would be found connecting Olkhon with Svaytol Nos; but depths exceeding 622 fathoms have been sounded even along that line. As to the northern basin, the configuration of its bottom is in accordance with the high mountains which surround it, and most of its area has a depth exceeding 400 fathoms, the maximum depths along three lines of soundings taken across it being 491, 485, and 476 fathoms respectively.

The water is beautifully clear.

**Temperature.**—The surface-layers of this immense basin are heated in the summer up to temperatures of 55° to 56° F., both close to the shores and at some distance from the mouth of the Selenga; but these warmer layers are not deep, and a uniform temperature of nearly 38° F. is generally found at a depth of 20 fathoms, as also on the surface in the middle of the lake. At a depth of 500 fathoms there is a nearly uniform temperature of 38°. At various places round the shores, e.g. the mouth of the Barguzin, hot springs exist. The lake freezes usually at the end of December, or in the beginning of January, so solidly that a temporary post-horse station is erected on the ice in the middle of the lake, and it remains frozen till the second half of May. The evaporation from this large basin exercises a certain influence on the climate of the surrounding country, while the absorption of heat for the thawing of the ice has a notable cooling effect in early summer.

**Rivers.**—Lake Baikal receives over 300 streams, mostly short mountain torrents, besides the Upper Angara, which enters the lake through its south-west extremity. The Barguzin, on the east, and the Selenga on the south-east, are the only outlets. This latter, flowing through Angara, which issues through a rocky cleft on the west shore, the Irkut no longer reaches the Baikal, though it once did so. After approaching its south-west extremity it abandons the broad valley which leads to the lake, and makes its way northwards through a narrow gap in the mountains and joins the Angara at Irkutsk.

**Mountains.**—With the exception of the delta of the Selenga, Lake Baikal is surrounded by lofty mountains. The Khamar-daban border-ridge (the summit of a mountain of the same name is 5300 ft. above the lake), falling with steep cliffs towards the lake, fringes it on the south; a massive, deeply-ravinied highland occupies the space between the Irkut and the Angara; the Onot and Baikal ridges (also Primorsky) run along its north-west shore, striking it diagonally; an Alpine complex of yet unexplored mountains rises on its north-east shore; the Barguzin range impinges upon it obliquely in the east; and the Ulan-burgas mountains intrude into the delta of the Selenga.

**Geology.**—It is certain that in previous geological ages Lake Baikal must have had a much greater and a much shallower expanse, with a greater surface area and a greater depth. The Angara delta and the Barguzin were then part of the Selenga delta. All these were built up on the bottom of the lake, and the surface of the lake was much lower than it is now. The geological activity of the lake is supposed to have been great in the Tertiary period, and the many sharp-sided islands and islets, which are seen in the lake, are supposed to be due to the action of the lake's waves and the currents created by the waves. These have been at work in the lake for many years.

**Fauna.**—The fauna, explored by Dybowsky and Godlewski, and in 1900–2 by Korotnev, is much richer than it was supposed to be, and has quite an original character; but hypotheses as to a direct communication having existed between Lake Baikal and the Arctic Ocean during the Post-Tertiary or Tertiary ages are not proved. Still, Lake Baikal has a seal (*Phoca vitulina, Phoca baikalensis* of Dybowsky) quite akin to the seals of Spitsbergen, marine sponges, polychaetae, a marine mollusc (*ancilodoris*), and some marine gammarids. The waters of the lake swarm with fish (sturgeons and salmonidae), and its hering (*Salmo omul*) is the chief product of the fisheries, though notably fewer have been taken within the last forty or fifty years. The lake is very abundant. The little Lake Frolitka, situated close to the northern extremity of Lake Baikal and communicating with it by means of a river of the same name, contains a peculiar species of trout, *Salmo erythrolepis*, which is not known elsewhere. Generally, while there is a relative poverty of zoological groups, there is a great wealth of species within the group. Of gammarids, there are as many as 300 species, and those living at great depths (330 to 380 fathoms) tend to assume abyssal characters similar to those displayed by the deep-sea fauna of the ocean.

**Navigation.**—Navigation of the lake is rendered difficult both by sudden storms and by the absence of good bays and ports.

---

1 See L. Pinvert, *L'Asie et le monde* (1900).
The principal port on the western shore, Listvinichnoe, near the outflow of the Angara, is an open roadstead at the foot of steep mountains. Steamers ply from it weekly to Misovaya (Posolok), on the opposite shore, a few times a year to Verkhne-Angarsk, at the northern extremity of the lake, and frequently to the mouth of the Selenga. Steamers ascend this river as far as Bilyutuy, near the Mongolian frontier, and bring back tea, imported via Kiahtka, while grain, cedar nuts, salt, soda, wool and timber are shipped on rafts down the Khilok, Chikoi and Uda (tributaries of the Selenga), and manufactured goods are taken up the river for export to China. Attempts are being made to render the Angara navigable below Irkutsk down to the Yenisei. In winter, when the lake is covered with ice 3 ft. to 4 ft. thick, it is crossed on sledges from Listvinichnoe to Misovaya. But a highway, available all the year round, was made in 1863–1864 around its southern shore, partly by blasting the cliffs, and it is still (since 1905) followed by the trans-Siberian railway. Further, a powerful ice-breaker is used to ferry trains across from Listvinichnoe to Misovaya.

BAIKIE, WILLIAM BALFOUR (1824–1864), Scottish explorer, naturalist and philologist, eldest son of Captain John Baikie, R.N., was born at Kirkwall, Orkney, on the 21st of August 1824. He studied medicine at Edinburgh, and, on obtaining his M.D. degree, joined the royal navy in 1843. He early attracted the notice of Sir Roderick Murchison, through whom he was appointed surgeon and naturalist to the Niger expedition sent out in 1854 by Macgregor Laird with government support. The death of the senior officer (Consul Cecroft) occurring at Fernando Po, Baikie succeeded to the command. Ascending the lower course of the river, he arrived at Surua on the 11th July, 1855. He then left the service and, about 248 m. beyond the point reached by the British, he established a settlement and began the exploration of the river. The expedition had been instructed to endeavour to afford assistance to Heinrich Barth (q.v.), who had in 1853 crossed the Benue in its upper course, but Baikie was unable to gain any trustworthy information concerning him. Returning to England, Baikie gave an account of his work in his Narrative of an Exploring Voyage up the Rivers Kwora and Bine.. . . (London, 1856). In March 1857 Baikie—

1 In English common law, the freeing or setting at liberty of one arrested or imprisoned upon any action, either civil or criminal, on surety taken for his appearance on a certain day and at a place named. The surety is termed bail, because the person arrested or imprisoned is placed in the custody of the person giving the surety, who is bound to appear and to keep the prisoner in safe keeping when required. So he may be released by them if they suspect that he is about to escape and surrendered to the court, when they are discharged from further liability. The sureties must be sufficient in the opinion of the court, and, as a rule, only housekeepers are accepted; in criminal cases the solicitor or an accomplice of the person to be bailed, a married woman or an infant will not be accepted. Bail is obligatory in all summary cases. It is also obligatory in all misdemeanours, except such as have been placed on the level of felonies, viz. obtaining or attempting to obtain property on false pretences, receiving property so obtained or stolen, perjury or subornation of perjury, conciliation of birth, willful or indecent exposure of the person, riot, assault in pursuance of a conspiracy to raise wages, assault upon a peace-officer in the execution of his duty or upon any one assisting him, neglect or breach of duty as a peace-officer, any prosecution of which the costs are payable out of the county or borough rate or fund. In cases of treason, bail can only be granted by a secretary of state or the king's bench division. A person charged with a felony cannot be entitled as of right to be bailed on bail. The power of admitting a prisoner to bail is discretionary and not ministerial, and the chief consideration in the exercise of that discretion must be the likelihood of the prisoner failing to appear at the trial. This must be gauged from the nature of the evidence in support of the accusation, the position of the accused and the severity of the punishment which his conviction will entail, as well as the independence of the sureties. The Bail Act 1869 gives a magistrat power, where a person is charged with felony or certain misdemeanours, or where he is committed for trial for any indictable offence, to dispense with sureties, if in his opinion the so dispensing will not tend to defeat the ends of justice. A surety may be examined on oath as to his means, while the court may also require notice to be given to the plaintiff, prosecutor or police. A person who has been taken into custody for an offence without a warrant, and cannot be brought before a court of summary jurisdiction within twenty-four hours, may be admitted to bail by a superintendent or inspector of police; and in a borough, if a person is arrested for a petty misdemeanour, he may be bailed by the constable in charge of the police-station. Bail in civil matters, since the abolition of arrest on mesne process, is virtually extinct. It took the form of an instrument termed a

2 The ultimate origin of this and cognate words is the Lat. "bailare," meaning to dance, and hence a bailler, also a baile, the bailiff or guardian, and hence a governor or custodian, from which comes "bailiff"; from bailare is derived the French baillier, to take charge of, or to place in charge of, and "bail " thus means "customary service," and is applied to the person who gives securit for the appearance of the prisoner, the security given, or the release of the prisoner on such security.
bail-bond, which was prepared in the sheriff's office after arrest, and executed by two sufficient sureties and the person arrested.

In admiralty proceedings *in rem*, bail is often required for procuring the release of arrested ships or cargo. It is also given without the arrest of the ship, as a substitution of personal security for that of the *res*, generally in an amount to cover the claim and costs.

In the United States, bail (in a sum fixed by the committing magistrate) is a matter of right in all cases where a sentence of death cannot be inflicted (Rev. Stat. § 1015). In those where such a sentence can be inflicted, it may be allowed by one of the judges of the United States courts at his discretion (ibid. § 1016).

BAILEY, of BAILEY, a town of southern Spain, in the province of Jaén; 21 m. by road N. of the city of Jaén. Pop. (1900) 7420. Bailey is probably the ancient Baecula, where the Romans, under P. Cornelius Scipio the elder, signalized the Carthaginians in 209 and 206 B.C. In its neighbourhood, also, in 1212, was fought the great battle of Las Navas de Tolosa, in which, according to the ancient chroniclers, the Castilians under Alphonso VIII, slew 200,000 Moors, and themselves only lost 25 men. Although this estimate is absurd, the victory of the Christians was complete. The capitalization of Bailey, signed at Andújar by the French general Dupont, on the 23rd of July 1808 after several days' hard fighting, involved the surrender of 17,000 men to the Spaniards, and was the first severe blow suffered by the French in the Peninsular War.

BAILEY, GAMALIEL (1807-1839), American journalist, was born at Mount Holly, New Jersey, on the 3rd of December 1807. He graduated at the Jefferson Medical College in Philadelphia in 1827. After editing for a short time a religious journal, the *Methodist Protestant*, at Baltimore, he removed in 1831 to Cincinnati, Ohio, where at first he devoted himself almost exclusively to the practice of medicine. He was also a lecturer on physiology at the Lane Theological Seminary, and at the time of the Lane Seminary debates (February 1834) between the pro-slavery and the anti-slavery students, and the subsequent withdrawal of the latter, he became an ardent abolitionist. In 1836 he joined James G. Birney in the editorial control of the *Philanthropist*; in the following year he succeeded Birney as editor, and conducted the paper in spite of threats and acts of violence—the printing-office being thrice wrecked by a mob—until 1847. From 1843 also he edited a daily paper, the *Herald*. In 1847 he assumed control of the new abolitionist organ, the *National Era*, at Washington, D.C. Here also his paper was the object of attack by pro-slavery mobs, at one time in 1848 the editor and printers being besieged in their office for three days. This paper had a considerable circulation, and in it, in 1851-1852, Mrs. H. B. Stowe's *Uncle Tom's Cabin* was first published. Bailey died at sea in the course of a trip to Europe on the 4th of June 1859.

BAILEY, NATHAN or NATHANIEL (d. 1742), English philologist and lexicographer. He compiled a *Dictionarium Britannicum: a more compleat universal etymological English dictionary than ever was before published*. It was first published in 1730 but supposed to have been published in 1721. This was a great improvement on all previous attempts, and formed the basis of Dr Johnson's great work. Bailey, who was a Seventh-day Baptist (admitted 1691), had a school at Stepney, near London, and was the author of *Dictionarium Domesticum* and several other educational works. He died on the 27th of June 1742.

BAILEY, PHILIP JAMES (1816-1902), English poet, author of *Festus*, was born at Nottingham on the 22nd of April 1816. His father, who himself published both prose and verse, owned and edited from 1845 to 1852 the *Nottingham Mercury*, one of the chief journals in his native town. Philip James Bailey received a local education until his sixteenth year, when he matriculated at Glasgow University. He did not, however, take his degree, but moved in 1835 to London and entered Lincoln's Inn. Without making serious practice of the law he settled at Barnsford, and for three years was occupied with the composition of *Festus*, which appeared anonymously in 1839.

Its success, both in England and America, was immediate. It passed through a dozen editions in the course of its birth, and nearly three times as many in the United States; and when in 1890 its author was able to publish a "Junii'eer Edition," he could feel that it was one of the few poems of its time which was known to both the older and the younger generations. Its author is known almost exclusively by his one volumnous poem, for though Bailey published other verses he is essentially a man of one book. *Festus* has undergone many changes and incorporations, but it remains a singular example of a piece of work virtually completed in youth, and never supplanted or reinforced by later achievements of its author. It is a vast pageant of theology and philosophy, comprising in some twelve divisions an attempt to represent the relation of God to man and of man to God, to emphasize the benignity of Providence, to preach the immortality of the soul, and to postulate "a gospel of faith and reason combined." It contains fine lines and dignified thought, but its ambitious theme, and a certain incoherency in the manner in which it is worked out, prevent it from being easily readable by any but the most sympathetic student. Bailey died on the 6th of September 1892.
facts or phenomena of consciousness. He criticizes very severely the habitual use of metaphorical language in describing mental operations. (2) His doctrine of perception, which is, in brief, that "the perception of external things through the organs of sense is a direct phenomenon; consciousness not being resolved into anything else," and the reality of which can be neither proved nor disproved, is not worked out in detail, but is supported by elaborate and sometimes subtle criticisms of all other theories. (3) With regard to general and abstract ideas and general propositions, his opinions are those of the empirical school, but his analysis frequently puts the matter in a new light. (4) In the theory of morals, Bailey is an advocate of utilitarianism (though he objects to the term utility "as being narrow a view of the thinking of sordid content"), and works out with great skill the steps in the formation of the "complex" mental facts involved in the recognition of duty, obligation, right. He bases all moral phenomena on five facts:—(1) Man is susceptible to pleasure (and pain) as a "some-thing"; (2) Man desires to reciprocate pleasure and pain received; (3) he expects such reciprocation from others; (5) he feels more or less sympathy with the same feelings in his fellows (Letters, 3rd series).

BAILEY—said to be a corruption of Ballium by some, and derived by others from the Fr. baille, a corruption of bataille, because they were drilled in battle array), the open space between the inner and outer lines of a fortification. Sometimes there were more than one, as the Inner and Outer Bailey; there are in England the Old Bailey at London and at York, and the Upper and Nether Bailes at Colchester.

Bailiff and Bailie (from Late Lat. bajulatus, adjetival form of bajulus, a governor or custodian; cf. Bail), a legal officer to whom some degree of authority, care or jurisdiction is committed. Bailiffs are of various kinds and their offices and duties vary greatly.

The term was first applied in England to the king's officers generally, such as sheriffs, mayors, &c., and more particularly to the chief officer of a hundred. The county within which the sheriff superintended with his jurisdiction is still called his bailiwick, while the term bailiff is retained as a title by the chief magistrates of various towns and the keepers of royal castles, as the high bailiff of Westminster, the bailiff of Dover Castle, &c. Under the manorial system, the bailiff, the steward and the reeve were important officers; the bailiff managed the property of the manor and superintended its cultivation (see Walter of Henley, Husbandry, R. Hist. Soc., 1890).

The bailiff of a franchise or liberty is the officer who executes writs and processes, and impanels juries within the franchise. He is appointed by the lord of such franchise (who, in the Sheriffs Act 1887, § 34, is referred to as the bailiff of the franchise).

The bailiff of a sheriff is an under-officer employed by a sheriff within a county for the purpose of executing writs, processes, and arrests. As a sheriff is liable for the acts of his officers acting under his warrant, his bailiffs are annually bound to him in an obligation with sureties for the faithful discharge of their office, and hence are called bound bailiffs. They are also sometimes called hum-bailiffs, or, shortly, hums. The origin of this word is uncertain; the New English Dictionary suggests that it is in allusion to the mode of catching the offender. Special bailiffs are officers appointed by the sheriff at the request of a plaintiff for the purpose of executing a particular process. The appointment of a special bailiff relieves the sheriff from all responsibility until the party is arrested and delivered into the sheriff's actual custody.

By the County Courts Act 1888, it is provided that there shall be one or more high-bailiffs appointed by the judge and removable by the lord-chancellor; and every person discharging the duties of high-bailiff is empowered to appoint a sufficient number of able and fit persons as bailiffs to assist him, whom he can dismiss at his pleasure. The duty of the high-bailiff is to serve all summonses and orders, and execute all the warrants, precepts and writs issued out of the court. The high bailiff is responsible for all the acts and defaults of himself, and of the bailiffs appointed to assist him, in the same way as a sheriff of a county is responsible for the acts and defaults of himself and his officers. By the same act (§ 49) bailiffs are answerable for any connivance, omission or neglect to levy any such execution. No action can be brought against a bailiff acting under order of the court without six days' notice (§ 55). Any warrant to a bailiff to give possession of a tenement justifies him in entering upon the premises named in the warrant, and giving possession, provided the entry be made between the hours of 9 A.M. and 4 P.M. (§ 142). The Law of Distress Amendment Act 1888 enacts that no person may act as a bailiff to levy any distress for rent, unless he is authorized by a county-court judge to act as a bailiff.

In the Channel Islands the bailiff is the first civil officer in each parish. He is appointed by the crown, and generally holds office for life. He presides at the royal court, and takes the opinions of the jurors; he also presides over the states, and represents the crown in all civil matters. Though he need not necessarily have had legal training, he is usually selected from among those who have held some appointment at the island bar.

In the United States the word bailiff has no special significance. It is sometimes applied to the officer who takes charge of juries and waits upon the court. The officer who corresponds to the English sheriff's bailiff is termed a deputy or under-sheriff.

Bailie—In Scotland the word bailiff has taken the form of "bailie," signifying a superior officer or magistrate of a municipal corporation. Bailies, by virtue of their office, are invested with certain judicial and administrative powers within the burgh for which they are appointed. They sit as police-court magistrates, being assisted usually by a paid legal adviser, called an "assessor," and, in the larger burghs, as a licensing court.

It is usually said that a bailie is analogous to the English alderman, but this is only in so far as he is a person of superior dignity in the council, for, unlike an alderman, he continues to sit for the ward for which he has been elected after selection as a bailie. He is always appointed from within the council, and his term of office is only that of an ordinary councillor, that is, for not more than three years. Bailie to give assise was the person who appeared for the superior at the ceremony of giving assise. This ceremony was abolished in 1845. "The Bailie of Holyrood, or Bailie of the Abbey," was the official who had jurisdiction in all civil debts contracted within the precincts of the sanctuary (g.v.).

Bailiff—In France the bailiff (bailiff), or seneschal in feudal days, was the principal officer of any noble importance. He was who held the feudal court of assizes when the lord was not present himself. A great noble often also had a prévôt, where small matters were settled, and the preparatory steps taken relative to the more important cases reserved for the assises. Among the great officers of the crown of France a grand-senechal formerly figured until the reign of Philip Augustus, when the last holder of the office was not replaced by a successor. It is also under Philip Augustus that local bailiffs first make a definite appearance. In the ordinance of 1190, by which the king, about to set forth on the crusade, arranged for the administration of the kingdom during his absence, they founded a system of royal bailiffs or seneschals. Some of these royal bailiffs or seneschals were the seigniorial bailiffs of certain great fiefs that had been reunited to the crown, their functions still continuing after the annexation. Their essential function was at first the surveillance of the royal provots (prévôt), who until then had had the sole administration of the various parts of the domain. They concentrated in their own hands the produce of the provostships, and they organized and led the men who by feudal rules owed military service to the king. They had also judicial functions, which, at first narrowly restricted in application, became much enlarged as time went on, and they held periodical assizes in the principal centres of their districts. When the right of appeal was instituted, it was they who heard the appeals from sentences pronounced by inferior royal judges and by the seigniorial justices. Royal cases, and cases in which a noble was defendant, were also reserved for them. The royal bailiff or seneschal (no real difference existed between the two offices, the names merely changing according to the district), was for long the king's principal representative in the provinces,
and the "bailliage or the sénéchaussée" was then as important administratively as judicially. But the political power of the bailiffs was greatly lessened when the provincial governors were created. They had already lost their financial powers, and their judicial functions now passed from them to their lieutenants.

By his origin the bailiff had a military character; he was an officer of the "short robe" and not of the "long robe," which in those days was no obstacle to his being well versed in precedents. But when, under the influence of Roman and canon law, the legal procedure of the civil courts became learned, the bailiff often availed himself of a right granted him by ancient public law: that of delegating the exercise of his functions to whomsoever he thought fit. He delegated his judicial functions to lieutenants, whom he selected and discharged at will. But as this delegation became habitual, the position of the lieutenants was strengthened; in the 16th century they became royal officers by title, and even dispossessed the bailiffs of their judiciary prerogatives. The tribunal of the "bailliage or sénéchaussée" underwent yet another transformation, becoming a stationary court of justice, the seat of which was fixed at the chief town. During the 15th and 16th centuries ambulatory assizes diminished in both frequency and importance. In the 17th and 18th centuries they were no more than a survival, the lieutenant of such a bailiff having preserved the right to hold one assize each year at a certain locality in his district. The ancient bailiff or bailli d'épée still existed, however; the judgments in the tribunal of the bailiages were delivered in his name, and he was responsible for their execution. So long as the military service of the ban and arrière ban, due to the king from all fief-holders, was maintained (and it was still in force at the end of the 17th century), it was the bailiffs who organized it. Finally the "bailliage" became in principle the electoral district for the states-general, the unit represented therein by its three estates. The judiciary nobles retained their judges, often called bailiffs, until the Revolution. These judges, who were competent to decide questions as to the payment of seigniorial dues, could not, legally at all events, themselves farm those revenues.

See Dupont Ferrier, Les Officiers royaux des bailiages et sénéchaussées et les institutions monarchiques locales en France à la fin du moyen âge (1902); Armand Beppe, Recueil de documents relatifs à la convocation des états-généraux de 1678 (3 vols. 1904) (vol. iii. gives the condition of the bailiages and sénéchaussées in 1789).

BAILLET, ADRIEN (1649-1706), French scholar and critic, was born on the 15th of June 1649, at the village of Neuville near Beauvais, in Picardy. His parents could only afford to send him to a small school in the village, but he picked up some Latin from the friars of a neighbouring convent, who brought him under the notice of the bishop of Beauvais. By his kindness Baillet received a thorough education at the theological seminary, and was afterwards appointed to a post as teacher in the college of Beauvais. In 1676 he was ordained priest and was presented to a small vicarage. He accepted in 1680 the appointment of librarian to M. de Lamoignon, advocate-general to the parlement of Paris, of whose library he made a catalogue raisonné (35 vols.), all written with his own hand. The remainder of his life was spent in incessant, unremitting labour; so keen was his devotion to study that he allowed himself only five hours a day for rest. He died on the 21st of January 1706. Of his numerous works the most conspicuous are: (1) Histoire de Hollande depuis la trève de 1609 jusqu'à 1690 (4 vols. 1693), a continuation of Grotius, and published under the name of La Neuville, (2) Les Vies des saïns . . . (4 vols. 1701), (3) Des Satires personnelles, traité historique et critique de celles qui portent le titre d'Ant (2 vols. 1689), (4) Vie de Descartes (2 vols. 1691), (5) Auteur des déguisés sous les noms étrangers, emprunté, &c. (1690), (6) Jugemens des savans sur les principaux ouvrages des auteurs (9 vols. 1681-1686). The last is the most celebrated and useful of all his works. At the time of his death he was engaged on a Dictionnaire universelle ecclesiastique. The praise bestowed on the Jansenists in the Jugemens des savans brought down on Baillet the hatred of the Jesuits, and his Vie des saïns, in which he brought his critical mind to bear on the question of miracles, caused some scandal. His Vie de Descartes is a mine of information on the philosopher and his work, derived from numerous unimpeachable authorities.

See the edition by M. de la Monnaye of the Jugemens des saïns (Amsterdam, 4 vols. 1725), which contains the Anti-Baillet of Gilles Ménage and an Abrégé de la vie de Mr Baillet.

BAILLIE, LADY GRIZEL (1665-1746), Scottish song-writer, eldest daughter of Sir Patrick Hume or Home of Polwarth, afterwards earl of Marchmont, was born at Redbraes Castle, Berwickshire, on the 25th of December 1665. When she was twelve years old she carried letters from her father to the Scottish patriot, Robert Baillie of Jerviswood, who was then in prison. Home's friendship for Bailie made him a suspected man, and the king's troops occupied Redbraes Castle. He remained in hiding for some time in a churchyard, where his daughter kept him supplied with food, but on hearing of the execution of Bailie (1684) he fled to Holland, where his family soon after joined him. They returned to Scotland at the Revolution. Lady Grizel married in 1702 George Baillie, son of the patriot. She died on the 6th of December 1746. She had two daughters, Grizel, who married Sir Alexander Murray of Stanhope, and Rachel, Lady Binning. Lady Murray had in her possession a MS. of her mother's in prose and verse. Some of the songs had been printed in Allan Ramsay's Tea-Table Miscellany. "And were my heart light I wed thee," the most famous of Lady Grizel's songs, originally appeared in Orpheus Caledonius (1725).

Memoirs of the Lives and Characters of the Right Hon. George Baillie of Jerviswood and Lady Grisell Baillie, by their daughter, Lady Murray of Stanhope, were printed in 1822. George Baillie's Correspondence (1702-1708) was edited by Lord Minto for the Bannatyne Club in 1842. The Legend of Lady Grizelda Bailie" forms one of Joanna Bailie's Metrical Legends of Exalted Character.

BAILLIE, JOANNA (1762-1851), British poet and dramatist, was born at the manse of Bothwell, on the banks of the Clyde, on the 11th of September 1762. She belonged to an old Scottish family, which claimed among its ancestors Sir William Wallace. At an early period she moved with her sister Agnes to London, where her brother, Dr Matthew Baillie, was settled. The two sisters inherited a small competence from their uncle, Dr William Hunter, and took up their residence at Hampstead, then on the outskirts of London, where they passed the remainder of their lives. Joanna Baillie had received an excellent education, and began very early to write poetry. She published anonymously in 1790 a volume called Fugitive Verses; but it was not till 1798 that she produced the first volume of her "plays on the passions" under the title of A Series of Plays. Her design was to illustrate each of the deepest and strongest passions of the human mind, such as hate, jealousy, fear, love, by a tragedy and a comedy, in each of which should be exhibited the actions of an individual under the influence of these passions. The first volume was published anonymously, but the authorship, though at first attributed to Sir Walter Scott, was soon discovered. The book had considerable success and was followed by a second volume in 1802, a third in 1812 and three volumes of Dramas in 1836. Miscellaneous Plays appeared in 1804, and the Family Legend in 1810. Miss Baillie herself intended her plays not for the closet but for the stage. The Family Legend, brought out in 1810 at Edinburgh, under the enthusiastic patronage of Sir Walter Scott, had a brief though brilliant success; De Montfou had a short run in London almost mainly through the acting of John Kemble and Mrs Siddons. Household Plots and The Separation were coldly received. With very few exceptions, Joanna Baillie's plays are unsuited for stage exhibition. Not only is there a flaw in the fundamental idea, viz. that of an individual who is the embodiment of a single passion, but the want of incident and the direction of the attention to a single point, present insuperable obstacles to their success as acting pieces. At the same time they show remarkable powers of analysis and acute observation and are written in a pure and vigorous style. Joanna Baillie's reputation does not rest entirely on her dramas; she was the author of some poems and songs of great beauty. The best of them are the Lines to Agnes Baillie on her Birthday, The Kitten, To a Child and some of her adaptations of Scottish songs, such as Wool'd and Married an' a'. Scattered throughout the dramas are also some lively and
beautiful songs, The Cough and the Crow in Orra, and the lover's song in the Phaenix. Miss Baillie died on the 23rd of February 1857, at the advanced age of 89, her faculties remaining unimpaired to the last. Her gentleness and sweetness of disposition made her a universal favourite, and her little cottage at Hambstead was the centre of a brilliant literary society.

See Joanna Baillie's Dramatic and Poetical Works (London, 1851).

BAILLIE, ROBERT (1602-1662), Scottish divine, was born at Glasgow. Having graduated there in 1620, he gave himself to the study of divinity. In 1631, after he had been ordained and had acted for some years as regent in the university, he was appointed to the living of Kilwinning in Ayrshire. In 1638 he was a member of the famous Glasgow Assembly, and soon after he accompanied Leslie and the Scottish army as chaplain or preacher. In 1642 he was made professor of divinity at Glasgow, and in the following year was selected as one of the five Scottish clergymen who were sent to the Westminster Assembly. In 1649 he was one of the commissioners sent to Holland for the purpose of inviting Charles II. to Scotland, and of settling the terms of his admission to the government. He continued to take an active part in all the minor disputes of the church, and in 1661 he was called the principal of the University of Edinburgh. In August of the following year, his death being probably hastened by his mortification at the apparently firm establishment of episcopacy in Scotland. Baillie was a man of learning and ability; his views were not extreme, and he played but a secondary part in the stirring events of the time. His Letters, by which he is now chiefly remembered, are of first-rate historical importance, and give a very lively picture of the period. A complete memoir and a full notice of all his writings will be found in D. Laing's edition of the Letters and Journals of Robert Baillie (1637-1662), Bannatyne Club, 3 vols. (Edinburgh, 1843-1845). Among his works are Lademium adoro, a psalm, Lamentations, an attack on Laud and his system, in reply to a publication which charged the Covenanters with Jesuirty; Apanationum of the Covenanters or the true nature of the Famiuisse, &c., a sermon; An Historical Vindication of the Government of the Church of Scotland; The Life of William (Laud) now Lord Archbishop of Canterbury Examined (London, 1643); A Parallel of the Liturgy with the Mass Book, the Breviary, the Ceremonial and other Romish Rituals (London, 1661).

BAILLIE, ROBERT (d. 1684), Scottish conspirator, known as BAILLIE OF JERVISWOOD, was the son of George Baillie of St. John's Kirk, Lanarkshire. He incurred the resentment of the Scottish government by rescuing, in June 1676, his brother-in-law Kirkton, a Presbyterian minister who had illegally been seized and confined in a house by Carstairs, an informer. He was fined £500, remaining in prison for four months and then being liberated on paying one-half of the fine to Carstairs. In despair at the state of his country he determined in 1683 to emigrate to South Carolina, but the plan came to nothing. The same year Baillie, with some of his friends, went to London and entered into communication with Monmouth, Russell and their party in order to obtain redress; and on the discovery of the Rye House Plot he was arrested. Questioned by the king himself he repudiated any knowledge of the conspiracy, but with striking truthfulness would not deny that he had been consulted by the vendors of the plot in Scotland. He was subsequently loaded with iron and sent back a prisoner to Scotland. Though there was no evidence whatever to support his connexion with the plot, he was fined £6000 and kept in close confinement. He was already in a languishing state when on the 23rd of December 1684 he was brought up again before the high court on the charge of treason. He was pronounced guilty on the following day and hanged the same afternoon at the market cross at Edinburgh with all the usual barbarities. His shocking treatment was long remembered as one of the worst crimes committed by the Stuart administration in Scotland. Bishop Burnet, who was his cousin, describes him as "in the presbyterian principles but ... a man of great piety and virtue, learned in the law, in mathematics and in languages." He married a sister of Sir Archibald Johnston, Lord Warriston, and left a son, George, who took refuge in Holland, afterwards returning with William III. and being restored to his estates.

BAILLY, JEAN SYLVAIN (1736-1793), French astronomer and orator, was born at Paris on the 9th of September 1736. Originally intended for the profession of a painter, he preferred writing tragedies until attracted to science by the influence of Nicolas de LaCaille. He calculated an orbit for the comet of 1759 (Halley's), reduced Lacaille's observations of 515 zodiacal stars, and was, in 1763, elected a member of the Academy of Sciences. His Essai sur la théorie des satellites de Jupiter (1766), an expansion of a memoir presented to the Academy in 1763, showed much original power; and it was followed up in 1771 by a noteworthy dissertation Sur les inégalités de la lumière des satelites de Jupiter. Meantime, he had gained a high literary reputation by his Éloges of Charles V., LaCaille, Molière, Corneille and Leibnitz, which were issued in a collected form in 1770 and 1790; he was admitted to the French Academy (February 26, 1784), and to the Académie des Inscriptions in 1785, when Fontenelle's simultaneous membership of all three Academies was renewed in him. Thenceforth, he devoted himself to the history of science, publishing successively:—Histoire de l'astronomie ancienne (1775); Histoire de l'astronomie moderne (3 vols. 1770-1782); Lettres sur l'origine des sciences (1777); Lettres sur l'origine des sciences (1779); and Traité de l'astronomie indienne et orientale (1787). This erudition was, however, marred by speculative extravaganzas.

The catalacmy of the French Revolution interrupted his studies. Elected deputy from Paris to the states-general, he was chosen president of the Third Estate (May 5, 1789), led the famous proceedings in the Tennis Court (June 20), and acted as mayor of Paris (July 15, 1789, to November 16, 1791). The dispersal by the National Guard, under his orders, of the riotous assembly in the Champ de Mars (July 17, 1791) rendered him obnoxious to the infuriated populace, and he retired to Nantes, where he composed his Mémoires d'un témoin (published in 3 vols. by MM. Berville and Barrière, 1821-1822), an incomplete narrative of the extraordinary events of his public life. Late in 1793, Bailly quitted Nantes to join his friend Pierre Simon Laplace at Melun; but was there recognized, arrested and brought (November 10) before the Revolutionary Tribunal at Paris. On the 12th of November he was guillotined amid the insults of a howling mob. He met his death with patient dignity, hearing, indeed, momentary shared the enthusiasm of his age, but taken no share in its crimes.

Notices of his life are contained in the Éloges by Ménard de Saint Just, Delisle de Salles, Lalande and Lacretelle; in a memoir by Arago, read the 26th of February 1844 before the Académie des Sciences, and published in the Annales de l'Observatoire, t. i. (1822). See also Delambre, Histoire de l'astronomie au 18me siècle, p. 725, and Lalande, Bibliographie astronomique, p. 730.

BAILMENT (from fr. bailler, to place in charge of, cf. bail), in law, a delivery of goods from one person called the bailor, to another person called the bailee, for some purpose, upon a contract, express or implied, that after the purpose has been fulfilled they shall be redelivered to the bailor, or otherwise dealt with according to his direction, or kept till he reclaims them. The following is Chief Justice Holt's classification of bailments in Cogges v. Board, 1704, 1 Sm. L.C. 167, which is generally adopted: (1) depositum, or delivery of goods to the bailee for a certain reward, in order that the bailor may keep the goods for the bailor. In this case, the bailee has no right to use the thing entrusted to him, and is liable for gross negligence, but not for ordinary negligence. Thus, where a customer had deposited some securities with his banker (who received nothing for his services) and they were stolen by a cashier, it was held that as there was no proof of gross negligence the banker was not liable (Giblin v. McMillen, 1868, L.R. 2 P.C. 317). (2) Commodatum, or loan, where goods or chattels that are useful are lent to the bailee gratis, to be used by him. The bailee may be justly considered as representing himself to the bailor to be a person of competent skill to take care of the thing lent (Wilson v. Brett, 1843, 17 M. & W. 173), and the transaction being a gratuitous loan, and one for the advantage of the bailer solely, he is bound to use great diligence in the protection of the thing bailed and will be responsible even for slight negligence. Thus, where a
horse was lent to the defendant to ride, it was held that it did not warrant him in allowing his servant to do so (Bringley v. Morris, 1765, 4 Mod. 270). But where a horse was for sale and the vendor allowed the defendant to have the horse for the purpose of trying it; it was held that he had a right to allow a competent person upon the horse to try it (Camos v. Scour, 1840, 9 C. & P. 383). (3) Locatio rei, or lending for hire. In the case of hiring the bailee is bound to use such diligence as a prudent man would exercise towards his own property. Thus, where the defendant hired a horse, and it had fallen ill, prescribed for it himself instead of calling in a veterinary surgeon, he was held liable for the loss (Dean v. Keate, 1811, 3 Camp. 4).

(4) Vadium, pawn or pledge; a bailment of personal property as a security for a debt. In this case the pledgee is bound to use ordinary diligence in guarding the thing pledged. (5) Locatio operis faciendi, where goods are delivered to be carried, or something is to be done about them for a reward to be paid to the bailee. In this case, the bailee is bound to use ordinary diligence in preserving the property entrusted to him. (6) Mandatum, a delivery of goods to somebody, who is to carry them, or do something in respect of them. The liabilities of a mandator and a depository are exactly the same; neither is liable for anything short of gross negligence.

See further under Banks and Banking; Carrier; Diligence; Factor; Hiring; Insns and Inkeepers; Lien; Negligence; Pledge; Pawnbroking; Principal and Agent &c.

BAILY, EDWARD HODGES (1788–1887), British sculptor, was born at Bristol on the 10th of March 1878. His father, who was a celebrated carver of figureheads for ships, destined him for a commercial life, but even at school the boy showed his natural taste and remarkable talents by producing numerous wax models and busts of his schoolfellows, and afterwards, when placed in a mercantile house, still carried on his favourite employment. Two Homeric studies, executed for a friend, were shown to J. Flaxman, who bestowed on them such high commendation that in 1807 Baily came to London and placed himself as a pupil under the great sculptor. In 1809 he entered the academy schools. In 1811 he gained the academy gold medal for a model of “Hercules restoring Alcestis to Admetus,” and soon after exhibited “Apollo discharging his Arrows against the Greeks,” and “Hercules casting Lichas into the Sea.” In 1821 he was elected R.A., and exhibited one of his best pieces, “Eve at the Fountain.” He was entrusted with the carving of the bas-reliefs on the south side of the Marble Arch in Hyde Park, and executed numerous busts and statues, such as those of Nelson in Trafalgar Square, of Earl Grey, of Lord Mansfield and others. Baily died at Holloway on the 22nd of May 1867.

BAILY, FRANCIS (1774–1844), English astronomer, was born at Newbury in Berkshire, on the 28th of April 1774. After a tour in the unsettled parts of North America in 1796–1797, his journal of which was edited by Augustus de Morgan in 1856, he entered the London Stock Exchange in 1799. The successive publication of Tables for the Purchasing and Renewing of Leases (1802), of The Doctrine of Interest and Annuities (1808), and The Doctrine of Life-Annuities and Assurances (1810), earned him a high reputation as a writer on life-contingencies; he amassed a fortune through diligence and integrity and retired from business in 1815, to devote himself wholly to astronomy. He had already, in 1820, taken a leading part in the foundation of the Royal Astronomical Society; and its gold medal was awarded him, in 1827, for his preparation of the Astronomical Society’s Catalogue of 2881 stars (Memoirs R. Astr. Soc. ii.).

The reform of the Nautical Almanac in 1829 was set on foot by his protests; he recommended to the British Association in 1837, and in great part executed, the reduction of Joseph de Lalande’s and Nicolas de Lacaille’s catalogues containing about 57,000 stars; he superintended the publication of the British Association’s Catalogue of 8377 stars (published 1845); and revised the catalogues of Tobias Mayer, Ptolemy, Ulugh Beg, Tycho Brahe, Edmund Halley and Hevelius (Memoirs R. Astr. Soc. iv., xiii.).

His notice of “Baily’s Beads,” during an annular eclipse of the sun on the 15th of May 1836, at Inch Bonney in Roxburghshire, started the modern series of eclipse-expeditions. The phenomenon, which depends upon the inequalities of the moon’s limb, was so vividly described by him as to attract an unprecedented amount of attention to the totality of the 8th of July 1842, observed by Baily himself at Pavia. He completed and discussed H. Foster’s pendulum-experiments, deducing from them an ellipticity for the earth of $\frac{1}{2}$ (Memoirs R. Astr. Soc. viii.); corrected for the length of the seconds-pendulum by introducing a neglected element of reduction; and was entrusted, in 1843, with the reconstruction of the standards of length. His laborious operations for determining the mean density of the earth, carried on by Henry Cavendish’s method (1838–1842), yielded for it the authoritative value of 5.66. He died in London, on the 30th of August 1844. Baily’s Account of the Rev. John Flamsteed (1835) is of fundamental importance to the scientific history of that time. It included a republication of the British Catalogue.

See J. Herschel’s Memoir of F. Baily, Esq. (1843), also prefixed to Baily’s Own Journal of a Tour, with a list of his writings; Month. Not. R. Astr. Soc. xiv. 1844.

BAILY, WILLIAM HELLIER (1809–1888), English palaeontologist, nephew of E. H. Baily the sculptor, was born at Bristol on the 7th of July 1819. From 1837 to 1844 he was Assistant Curator in the Bristol Museum, a post he relinquished to join the staff of the Geological Survey in London. In 1854 he became assistant naturalist, under Edward Forbes and afterwards under Huxley. In 1875 he was transferred to the Irish branch of the Geological Survey, as acting palaeontologist, and retained this post until the end of his life. He was the author of many papers on palaeontological subjects, and of notes on fossils in the explanatory memoirs of the Geological Survey of Ireland. He published (1867–1875) a useful work entitled Figures of Characteristic British Fossils, with Descriptive Remarks, of which only the first volume, dealing with palaeozoic species, was issued. The figures were all drawn on stone by himself. He died at Rathmies near Dublin on the 6th of August 1888.

BAIN, ALEXANDER (1818–1863), Scottish philosopher and educationalist, was born on the 11th of June 1818 at Aboyne, where he received his first schooling. In early life he was a weaver, hence the punning description of him as W.evir, rex philosophorum. In 1836 he entered Marischal College, and came under the influence of John Cruickshank, professor of mathematics, Thomas Clark, professor of chemistry, and William Knight, professor of natural philosophy. His college career was distinguished, especially in mental philosophy, mathematics and physics. Towards the end of his arts course he became a contributor to the Westminster Review (first article “Electrotey and Daguerreotype,” September 1840). This was the beginning of his connexion with John Stuart Mill, which led to a life-long friendship. In 1841 he became substitute for Dr Glennie, the professor of moral philosophy, who, through ill-health, was unable to discharge the active duties of the chair. This post he occupied for three successive sessions, during which he continued writing for the Westminster, and also in 1842 helped Mill with the revision of the MS. of his System of Logic. In 1843 he contributed the first review of the book to the London and Westminster. In 1845 he was appointed professor of mathematics and natural philosophy in the Andersonian University of Glasgow. A year later, preferring a wider field, he resigned the position and devoted himself to literary work. In 1848 he removed to London to fill a post in the board of health, under Edwin Chadwick, and became a prominent member of the brilliant circle which included George Grove and John Stuart Mill. In 1855 he published his first large work, The Senses and the Intellectual, followed in 1850 by The Emotions and the Will. These treatises won for him a position among independent thinkers. He was examiner in logical and moral philosophy (1857–1862 and 1864–1869) to the university of London, and in moral science in the Indian Civil Service examinations.

In 1860 he was appointed by the crown to the new chair of
logic and English in the university of Aberdeen (created on the amalgamation of the two colleges, King's and Marischal, by the Scottish Universities Commission of 1858). Up to this date neither logic nor English had received adequate attention in Aberdeen, and Bain devoted himself to supplying these deficiencies. He succeeded not only in raising the standard of education generally in the north of Scotland, but also in forming a school of philosophy and in widely influencing the teaching of English grammar and composition. His efforts were first directed to the preparation of English textbooks: Higher English Grammar (1863), followed in 1866 by the Manual of Rhetoric, in 1872 by A First English Grammar, and in 1874 by the Companion to the Higher Grammar. These works covered a large field and their original views and methods met with wide acceptance. But the other subject of his chair also called for attention. His own philosophical writings already published, especially The Senses and the Intelect (to which was added, in 1864, The Study of Character, including an Estimate of Phrenology), were too large for effective use in the class-room. Accordingly in 1868, he published his Manual of Mental and Moral Science, mainly a condensed form of his treatises, with the doctrines re-stated, and in many instances freshly illustrated, and with many important additions. The year 1870 saw the publication of the Logic. This, too, was a work designed for the use of students; it was based on J. S. Mill, but differed from him in many particulars, and had as distinctive features the treatment of the doctrine of the conservation of energy in connexion with causation and the detailed application of the principles of logic to the various sciences. His services to education in Scotland were now recognized by the conferment of the honorary degree of doctor of laws by the university of Edinburgh in 1871. Next came two publications in "The International Scientific Series," namely, Mind and Body (1872), and Education as a Science (1879).

All these works, from the Higher English Grammar downwards, were written by Bain during his twenty years' professorate at Aberdeen. To the same period belongs his institution of the philosophical journal Mind; the first number appeared in January 1876, under the editorship of a former pupil, G. Croom Robertson, of University College, London. To this journal Bain contributed many important articles and discussions; and in fact he bore the whole expenses of it till Robertson, owing to ill-health, resigned the editorship in 1891, when it passed into other hands. Bain resigned his professorship in 1880 and was succeeded by William Minto, one of his most brilliant pupils. Nevertheless his interest in thought, and his desire to complete the scheme of work mapped out in earlier years, remained as keen as ever. Accordingly, in 1882 appeared the Biography of James Mill, and accompanying it John Stuart Mill: a Criticism, with Personal Recollections. Next came (1884) a collection of articles and papers, most of which had appeared in magazines, under the title of Practical Essays. This was succeeded (1887, 1888) by a new edition of the Rhetoric, and along with it, a book On Teaching English, being an exhaustive application of the principles of rhetoric to the criticism of style, for the use of schools and instructors. In 1888 appeared the second edition of The Senses and the Intelect, which contains his last word on psychology. In 1894 also appeared his last contribution to Mind. His last years were spent in privacy at Aberdeen, where he died on the 18th of September 1903. He married twice but left no children.

Bain's life was mainly that of a thinker and a man of letters. But he also took a keen interest and frequently an active part in the political and social movements of the day; and so highly did the students of Aberdeen rate his practical ability, that, after his retirement from the chair of logic, they twice in succession elected him lord rector of the university, each term of office extending over three years. He was a strenuous advocate of reform, especially in the teaching of sciences, and supported the claims of modern languages to a place in the curriculum. A marble bust of him stands in the public library and his portrait hangs in the Marischal College.

Wide as Bain's influence has been as a logician, a grammarian and a writer on rhetoric, his reputation rests on his psychology. At one with Johannes Müller in the conviction psychologe nemo niss physiologe, he was the first in Great Britain during the 19th century to approach psychology in a thoroughly scientific fashion to the elucidation of mental states. He was the originator of the theory of psycho-physical parallelism, which is used so widely as a working basis by modern psychologists. His idea of applying the natural history method of classification to psychological phenomena gave scientific character to his work, the value of which was enhanced by his methodical exposition and his command of illustration. In line with this, too, is his demand that psychology shall be cleared of metaphysics; and to his lead is no doubt due in great measure the position that psychology has now acquired as a distinct positive science.

Prof. Wm. James calls his work the "last word" of the earlier stage of psychology, but he was in reality the pioneer of the new. Subsequent psycho-physical investigations have all been in the spirit of his work; and although he consistently advocated the inductive method in psychological investigation, he was among the first to appreciate the help that may be given to it by animal and social and infant psychology. He may justly claim the merit of having guided the awakened psychological interest of British thinkers of the second half of the 19th century into fruitful channels. He emphasized the importance of our active experiences of movement and effort, and though his theory of a central innervation sense is no longer held as he propounded it, its value as a suggestion to later psychologists is great. His autobiography, published in 1904, contains a full list of his works, and also the history of the last thirteen years of his life by W. L. Davidson of Aberdeen University, who further contributed to Mind (April 1904) a review of Bain's services to philosophy.

Works (beside the above)—Edition with notes of Paley's Moral Philosophy (1842); Education as a Science (1879); Dissertations on leading physiological topics (1882), mainly reprints of papers in Mind; he collaborated with J. S. Mill and Grote in editing James Mill's Analysis of the Phenomena of the Human Mind (1869), and assisted in editing Grote's Aristotle and Minor Works; he also wrote a memoir prefixed to G. Croom Robertson's Philosophical Remains (1864). (See Psychology and Association of Ideas.)

BAIN, ANDREW GEDDES (1797–1864), British geologist, was a native of Scotland. In 1820 he emigrated to Cape Colony, and carried on for some years the business of a saddler at Graaf Reinet. During the Kaffir War in 1833–34 he took command of a provisional battalion raised for the defence of the frontier. Later he was engaged to construct a military road through the Ecca Pass, and displayed engineering talents which led to his being permanently employed as engineer of military roads under the corps of Royal Engineers. This occupation created an interest in geology, which was fostered in 1837 by the loan of Lyell's Elements. He discovered the remains of many reptilia, including the Dicyodon, which was obtained from the Karroo Beds near Fort Beaufort and described by Owen. Devoting all his spare energies to geological studies, Bain prepared in 1832 the first comprehensive geological map of South Africa, a work of great merit, which was published by the Geological Society of London in 1852. He died in 1864.

BAINBRIDGE, JOHN (1582–1643), English astronomer, was born at Ashby-de-la-Zouch, in Leicestershire. He started as a physician and practised for some years, kept a school and studied astronomy. Having removed to London, he was admitted (November 6, 1618) a licentiate of the college of physicians, and attracted notice by a publication concerning the comet of 1618. Sir Henry Savile (1549–1622) thereupon appointed him in 1619 to the Savilian chair of astronomy just founded by him at Oxford; Bainbridge was incorporated of Merton College and became, in 1631 and 1635 respectively, junior and senior reader of Linacre's lectures. He died at Oxford on the 3rd of November 1643. He wrote An Astronomical Description of the late Comet (1616); Canonicalia (1648); and translated Proclus' De Sphaera, and Ptolomy's De Planetarum Hypothesibus (1620). Several
BAINBRIDGE, WILLIAM (1774–1833), commodore in the United States navy, was born on the 7th of May 1774 in Princeton, New Jersey. At the age of fourteen he went to sea in the merchant service, and was in command of a trading schooner at an early age. The American trading vessels of that period were supposed to be excluded by the navigation laws from commerce with the British West Indian Islands, though with the concealed or very slightly disguised assistance of the planters, they engaged in a good deal of contraband commerce. The war between France and Great Britain tended further to make the carrying trade of neutrals difficult. Bainbridge had therefore to expect, and when he could to elude or beat off, much interference on the part of French and British cruisers alike. He is said to have forced a British schooner, probably a privateer, which attacked him when on his way from Bordeaux to St Thomas, to strike, but he did not take possession. On another occasion he is said to have taken a man out of a British ship in retaliation for the impressment of an American seaman by H.M.S. "Indefatigable," then commanded by Sir Edward Pellew. When the United States navy was organized in 1798 it was included in the corps of naval officers, and he was ordered a "Schooner Retaliation." He was on one occasion seized by the French but afterwards released. As captain of the brig "Norfolk" of 18 guns, he was employed in cruising against the French, who were as aggressive against American commerce as the English. He was also sent to carry the tribute which the United States still condescended to pay to the sultan of Algiers, in order to secure exemption from capture for its merchant ships in the Mediterranean—a service which he performed punctually, though with great discretion. When the United States found that bribing the pirate Barbary states did not secure exemption from their outrages, and was constrained at last to use force, he served against Algiers and Tunis. His ship, the "Philadelphia," ran aground on the Tunisian coast, and he was for a time imprisoned. On his release he returned for a time to the merchant service in order to make good the pecuniary loss caused by his captivity. When the war of 1812 broke out between Great Britain and the United States, Bainbridge was appointed to command the United States frigate "Constitution" (44), in succession to Captain Isaac Hull (q.v.). The "Constitution" was a very fine ship of 1532 tons, and captured the "Guerrière." Under Bainbridge she was sent to cruise in the South Atlantic. On the 26th of December 1812 he fell in with H.M.S. "Java," a vessel of 1073 tons, formerly the French frigate "Renommée" (40). She was on her way to the East Indies, carrying the newly appointed lieutenant-governor of Bombay. She had a very raw crew, including very few real seamen, and her men had only had one day's gunnery drill. The United States navy paid great attention to its gunnery, which the British navy, misled by its easy victories over the French, had greatly neglected. In these conditions the fate of the "Java" was soon sealed. She was cut to pieces and forced to surrender, after suffering heavy loss, and inflicting very little on the "Constitution." After the conclusion of the war with Great Britain, Bainbridge served against the Barbary pirates once more. During his later years he served on the board of navy commissioners. He died on the 28th of July 1833. (D. H.)

BAINDIR (anc. Casvitra), a town in Asiatic Turkey in the Aïdin vilayet, situated in the valley of the Kuchuk Menderes. Pop. under 10,000, nearly half Christian. It is connected with Smyrna by a branch of the Aïdin railway, and has a trade in cotton, figs, raisins and tobacco.

BAINES, EDWARD (1774–1848), English newspaper-proprietor and politician, was born in 1774 at Walton-le-Dale, near Preston, Lancashire. He was educated at the grammar schools of Hawshead and Preston, and at the age of sixteen was apprenticed to a prin'ter in the latter town. After remaining there four years and a half he removed to Leeds, finished his apprenticeship, and at once started in business for himself. He was always a most assiduous student, and quickly became known as a man of great practical shrewdness and ability, who took a keen interest in political and social movements. His political opinions led him to sympathize with nonconformity and he soon joined the Independent Church. In 1801 the assistance of party friends enabled him to buy the Leeds Mercury. Provincial newspapers did not at that time possess much influence; it was no part of the editor's duty to supply what are now called "leading articles," and the system of reporting was defective. In both respects Baines made a complete change in the Mercury. His able political articles gradually made the paper the organ of Liberal opinion in Leeds, and the connexion of the Baines family with the paper made their influence powerful for many years in this direction. Baines soon began to take a prominent part in politics; he was an ardent advocate of parliamentary reform, and it was mainly by his influence that Macaulay was returned for Leeds in 1832; and in 1834 he succeeded Macaulay as member. He was re-elected in 1835 and 1837, but resigned in 1841. In parliament he supported the Liberal party, but with independent views. Like his son Edward after him, he strongly advocated the separation of church and state, and opposed government interference in national education. His letters to Lord John Russell on the latter question (1840) had a powerful influence in determining the opinion of the government. He died in 1848. His best-known writings are The History, Directory and Gazetteer of the County of York; History, Directory and Gazetteer of the County of Lancaster; History of the County Palatine and Duchy of Lancaster. He was also the author of A History of the Wars of Napoleon, which was continued under the title of A History of the Reign of George III.

His Life (1801) has been written by his son, Sir Edward Baines (1800–1890), who was editor and afterwards proprietor of the Leeds Mercury, M.P. for Leeds (1859–1874), and was knighted in 1880; his History of the Cotton Manufacture (1835) was long a standard authority. An elder son, Matthew Talbot Baines (1799–1860), went to the bar, and became recorder of Hull (1837). He became M.P. for Hull in 1847, and in 1849 president of the Poor Law Board. In 1852 he was returned for Leeds, and again became president of the Poor Law Board (till 1853). In 1856 he entered the cabinet as chancellor of the duchy of Lancaster.

BAINI, GIUSEPPE (1775–1844), Italian priest, musical critic and composer of church music, was born at Rome on the 21st of October 1775. He was instructed in composition by his uncle, Luigi Bardi, and afterwards by G. Jannacci. In 1814 he was appointed musical director to the choir of the Papal chapel, to which he had as early as 1802 gained admission in virtue of his fine bass voice. His compositions, of which very few have been published, were very favourable specimens of the severe ecclesiastical style; one in particular, a ten-part Missere, composed for Holy Week in 1821 by order of Pope Pius VII., has taken a permanent place in the services of the Sistine chapel during Passion Week. Baini held a higher place, however, as a musical critic and historian than as a composer, and his Life of Palestrina (Memorie storico-critiche della vita e delle opere di Giovanni Pierluigi da Palestrina, 1828) ranks as one of the best works of its class. The phrase Il Principe della Music, which has become finally associated with the name of Palestrina, originates with this biography. Giuseppe Baini died on the 21st of May 1844 in Rome.

BAIRAM, a Perso-Turkish word meaning "festival," applied in Turkish to the two principal festivals of Islam. The first of these, according to the calendar, is the "Lesser Festival," meaning the Turks Kûshîh Bâirâm ("Lesser Bairam"), or Sheker Bâirâm ("Summer Bairam"), a festival observed by the Arabic-speaking Moslems I'd al-Fitr ("Festival of Fast-breaking"), or al-lid ar-âshâgîr ("Lesser Festival"). It follows immediately the ninth or the fasting-month, Ramadân, occupying the first three days of the tenth month, Shawwâl. It is, therefore, also called by Turks Ramâzan Bâirâm, and exhibits more outward signs of rejoicing than the technically "Greater Festival." Official receptions are held on it, and private visits paid; friends congratulate one another, and presents are given; new clothes...
BAIRD, SIR DAVID (1757–1820), British general, was born at Newbury in Aberdeenshire in December 1777. He entered the British army in 1773, and was sent to India in 1779 with the 73rd (afterwards 71st) Highlanders, in which he was a captain. Immediately on his arrival, Baird was attached to the force commanded by Sir Hector Munro, which was sent forward to assist the detachment of doubtful spirit which had left the Cavalry, and which followed the whole force was destroyed, and Baird, severely wounded, fell into the hands of the Mysore chief. The prisoners, who were most barbarously treated, remained captive for over four years. Baird’s mother, on hearing that her son and other prisoners were in fetters, is said to have remarked, “God help the chief chained to our Davie.” The bullet was not extracted from Baird’s wound until his release. He became major in 1787, visited England in 1789, and purchased a lieutenant-colonelcy in 1790, returning to India in the following year. He held a brigade command in the war against Tipoo, and served under Cornwallis in the Seringapatam operations of 1792, being promoted colonel in 1795. Baird served also at the Cape of Good Hope as a brigadier-general, and he returned to India as a major-general in 1798. In the last war against Tipoo in 1799 Baird was appointed to the senior brigade command in the army. At the successful assault of Seringapatam Baird led the storming party, and was soon a master of the stronghold in which he had long been a prisoner. He had been disappointed at the command of the large contingent of the nizam which was given to Colonel Arpe, and, after the capture of the fortress the same officer obtained the governorship, Baird judged himself to have been treated with injustice and disrespect. He afterwards received the thanks of parliament and of the East India Company for his gallant bearing on that important day, and a pension was offered to him by the Company, which he declined, apparently from the hope of receiving the order of the Bath from the government. General Baird commanded the Indian army which was sent in 1801 to co-operate with Abercromby in the expulsion of the French from Egypt. Wellesley was appointed second in command, but owing to ill-health did not accompany the expedition. Baird landed at Kosseir, conducted his army across the desert to Kena on the Nile, and thence to Cairo. He arrived before Alexandria in time for the final operations. On his return to India in 1802, he was employed against Sindiah, but being irritated at another appointment given to Wellesley he relinquished his command and returned to Europe. In 1804 he was knighted, and in 1805–1806, being by now a lieutenant-general, he commanded the expedition against the Cape of Good Hope with complete success, capturing Cape Town, and the Dutch East India Company’s forts. But here again his usual ill luck attended him. Commodore Sir Home Popham persuaded Sir David to lend him troops for an expedition against Buenos Aires; the successive failures of operations against this place involved the recall of Baird, though on his return home he was quickly re-employed as a divisional general in the Copenhagen expedition of 1807. During the bombardment of Copenhagen Baird was wounded. Shortly after his return, he was sent out to the Peninsula War in command of a considerable force which was sent to Spain to co-operate with Sir John Moore, to whom he was appointed second in command. It was Baird’s misfortune that he was junior by a few days both to Moore and to Lord Cavan, under whom he had served at Alexandria, and thus never had an opportunity of a chief command in the field. At the battle of Corunna he succeeded to the supreme command after Moore’s fall, but shortly afterwards his left arm was shattered, and the command passed to Sir John Hope. He again obtained the thanks of parliament for his gallant services, and was made a K.B. and a baronet. Sir David married Miss Campbell-Preston, a Perthshire heiress, in 1810. He was not employed again in the field, and personal and political enmities caused him to be neglected and rather passed over. He was not given the full rank of general until 1814, and his governorship of Kinsale was given five years later. In 1820 he was appointed commander-in-chief in Ireland, but the command was soon reduced, and he resigned in 1822. He died on the 18th of August 1829.

See Theodore Hook’s Life of Sir David Baird.

BAIRD, HENRY MARTYN (1832–1906), American historian and educationalist, a son of Robert Baird (1798–1863), a Presbyterian preacher and author who worked earnestly both in the United States and in Europe for the cause of temperance, was born in Philadelphia, Pennsylvania, on the 17th of January 1832. He spent eight years of his early youth with his father in Paris and Geneva, and in 1850 graduated at New York University. He then lived for two years in Italy and Greece, was a student in the Union Theological Seminary in New York city from 1853 to 1855, and in 1856 graduated at the Princeton Theological Seminary. He was a tutor for four years in the College of New Jersey (now Princeton University), and from 1859 until his death was professor of Greek language and literature in New York University. He is best known, however, as a historian of the Huguenots. His work, which appeared in three parts, entitled respectively History of the Rise of the Huguenots of France (2 vols., 1879), The Huguenots and Henry of Navarre (2 vols., 1886), and The Huguenots and the Revocation of the Edict of Nantes (2 vols., 1895), is characterized by painstaking thoroughness, by a judicial temper, and by scholarship of a high order. He also published Modern Greece, A Narrative of a Residence and Travels in that Country (1856); a biography of his father, The Life of the Rev. Robert Baird, D.D. (1886); and Theodore Robert Baird’s Reminiscences (1899). He died in New York city on the 11th of November 1906.

His brother, CHARLES WASHINGTON BAIRD (1828–1887), a graduate of New York University (1848) and of the Union Theological Seminary (1852), and the minister in turn of a Dutch Reformed church at Brooklyn, New York, and of a Presbyterian church at Rye, New York, also was deeply interested in the history of the Huguenots, and published a scholarly work entitled The History of the Huguenot Emigration to America (2 vols., 1885), left unfinished at his death.

BAIRD, JAMES (1802–1870) Scottish iron-master, was born at Kirkwood, Lanarkshire, on the 4th of December 1802, the son of a coal-master. In 1816 his father, two brothers and himself leased coalfields at Gartsherrie and in the vicinity, and in 1828 iron mines near by, and in 1830 built blast furnaces. In this year the father retired, the firm of William Baird & Co. was organized; and James Baird assumed active control. His improvements in machinery largely increased the output of his furnaces, which by 1864 had grown in number to nearly fifty, producing 300,000 tons annually and employing 10,000 hands. The brothers became great landowners, and James bequeathed his estates to his son, Robert, in 1867. He died at his estate near Ayr on the 20th of June 1876, leaving property valued at three million pounds. He had been during his life a great public benefactor, founding schools and the Baird Lectures (1871) for the defence of orthodox theology, and in 1873 the Baird Trust of £500,000 to enable the Established Church of Scotland to cope with the spiritual needs of the masses. He was twice married but left no children.

BAIRD, SPENCER FULLERTON (1827–1887), American naturalist. was born in Reading, Pennsylvania, on the 3rd of
February 1823. He graduated at Dickinson College, Carlisle, Pennsylvania in 1840, and next year made an ornithological excursion through the mountains of Pennsylvania, walking, says one of his biographers, "400 m. in twenty-one days, and the last day 60 m." In 1838 he met J. J. Audubon, and thenceforward his studies were largely ornithological, Audubon giving him a part of his own collection of birds. After studying medicine for a time, Baird became professor of natural history in Dickinson College in 1845, assuming also the duties of the chair of chemistry, and giving instruction in physiology and mathematics. This variety of duties in a small college tended to give him that breadth of scientific interest which characterized him through life, and made him perhaps the most representative general man of science in America. For the long period between 1850 and 1876 he was assistant-secretary of the Smithsonian Institution, Washington, and on the death of Joseph Henry he became secretary. From 1871 till his death he was U.S. Commissioner of Fish and Fisheries. While an officer of the Smithsonian, Baird's duties included the superintendence of the labour of workers in a wide different lines. Thus, apart from his assistance to others, his own studies and published writings cover a broad range: iconography, geology, mineralogy, botany, anthropology, general zoology, and, in particular, ornithology; while for a series of years he edited an annual volume summarizing progress in all scientific lines of investigation. He gave general superintendence, between 1850 and 1860, to several government expeditions for scientific exploration of the western territories of the United States, preparing for them a manual of Instructions to Collectors. Of his own publications, the bibliography by G. Brown Goode, from 1843 to the close of 1882, includes 1663 entries, of which 775 were short articles in his *Annual Record*. His most important volumes, on the whole, were Birds, in the series of reports of explorations and surveys for a railway route from the Mississippi river to the Pacific ocean (1858), of which Dr Elliott Coues says (as quoted in the *Popular Science Monthly*, xxxiii. 553) that it "exerted an influence perhaps stronger and more widely felt than that of any of its predecessors, Audubon's and Wilson's not excepted," and marked an epoch in the history of American ornithology; *Mammals of North America: Descriptions based on Collections in the Smithsonian Institution* (Philadelphia, 1859); and the monumental work (with Thomas Mayo Brewer and Robert Ridgway) *History of North American Birds* (Boston, 1875-1884; "Land Birds," 3 vols., "Water Birds," 2 vols.) He died on the 10th of August 1887 at the great marine biological laboratory at Woods Hole, Massachusetts, an institution which was largely the result of his own efforts, and which has exercised a wide effect upon both scientific and economic ichthyology.

**BAIRNSDALE—BAJOCIAN**

225

Bairdsdale, a town of Tanjil county, Victoria, Australia, on the Mitchell river, 171 m. by rail E. of Melbourne. Pop. (1901) 3074. It lies near the head of a lagoon called Lake King, which is open to the sea, and affords regular communication by water with Melbourne. In the district, which is chiefly pastoral, there are several goldfields, with both alluvial and reef mining. The town has tanneries, and cheese and butter factories. There is an active shipping trade with Melbourne in maize and other grain, hides and wool, and dairy produce.

**BAITER, JOHANN GEORG** (1801-1877), Swiss philologist and textual critic, was born at Zürich on the 31st of May 1801. Having received his early education in his native place, he went (1818) to the university of Tübingen, but from want of funds was obliged to return to Zürich, where for several years he was a private tutor. From 1824 to 1829 he studied at Munich under Friedrich Thiersch; at Göttingen, under Georg Diissen; at Königsberg, under Christian Lobek. From 1833 to 1876 he was Oberlehrer at the gymnasium in Zürich, where he died on the 10th of October 1877. Baiter's strong point was textual criticism, applied chiefly to Cicero and the Attic orators; he was very successful in hunting up the best MS. authorities, and his collations were made with the greatest accuracy. Most of his works were produced in collaboration with other scholars, such as Orelli, who regarded him as his right-hand man. He edited Isocrates. *Panegyricus* (1831); with Saupe, Lycurgus, *Leocratea* (1834) and *Oratore Attici* (1835-1836); with Orelli and Winckelmann, the critical edition of Plato (1839-1842), which marked a distinct advance in the text; two large MSS. being laid under contribution; with Orelli, Bähr, *Fossilia Jambicae super reperta* (1845); Isocrates, in the Didot collection of classics (1846). He had for some time been associated with Orelli in his great work on Cicero, and assisted in *Ciceronis Scholastiae* (1853) and *Onomasticon Tullianum* (1856-1858). For the *Posti Consularis* and *Triumphales* he was alone responsible. With Orelli and (after his death) Halm, he assisted in the second edition of the Cicero, and, with Kayser, edited the same author for the *Taurinunti series* (1860-1869). New editions of Orelli's *Tacitus* and Horace were also due to him. It is worth noting that, with Saupe, he translated Leake's *Topography of Athens*.

**BAIUS, or DE BAY, MICHAEL** (1513-1586), Belgian theologian, was born at Melun in Hainault in 1513. Educated at Louvain University, he studied philosophy and theology with distinguished success, and was rewarded by a series of academic appointments. In 1552 Charles V. appointed him professor of scriptural interpretation in the university. In 1563 he was nominated one of the Belgian representatives at the council of Trent, but arrived too late to take an active part in its deliberations. At Louvain, however, he obtained a great name as a leader in the anti-scholastic reaction of the 16th century. The champions of this reaction fought under the banner of St Augustine; and Baius' Augustinian predictions brought him into conflict with Rome on questions of grace, free-will and the like. In 1567 Pius V. condemned seventy-nine propositions from his writings in the *Ex omnibus afflictionibus*. To this Baius submitted; though certain indirect utterances on the part of himself and his supporters led to a renewal of the condemnation in 1570 by Gregory XIII. Baius, however, was not disturbed in the tenure of his professorship, and even became chancellor of Louvain in 1575. He died, still in the enjoyment of these two dignities, in 1589. Baius is chiefly interesting as a forerunner of the more celebrated Cornelius Jansen (see Jansen). His writings are described by Harnack as a curious mixture of Catholic orthodoxy and unconscious tendencies to Protestantism; the moral point of great importance they attach to the fact of sin, both original and actual.

His principal works were published in a collected form at Tübingen, 1616, i. vols. 1603-1604. Most of his treatises have not been published. There is an excellent study of both books and author by Lissenmann, Michael Baius, und die Grundlegung des Jansenismus, published at Tübingen in 1867.

**BAIZE (16th century Fr. baies, cf. English "bay"), a material probably named from its original colour, though a derivation is also suggested from the Fr. baie, as the cloth is said to have been originally dyed with Avignon berries. It is generally a coarse, woolen cloth with a long nap and is commonly dyed green or red. It is now also made of cotton. The manufacture is said to have been introduced into England in the 16th century by refugees from France and the Netherlands. It is used chiefly for curtains, linings, &c., and sometimes, in the lighter makes, for chair seats. *Table baize* is a kind of oilcloth used as a cheap and easily-cleaned covering for tables.

**BAJOCIAN, in geology, the name proposed in 1849 by d'Orbigny for the rocks of Middle Jurassic age which are well developed in the neighbourhood of Bayeux, Calvados. The Bajocian stage is practically equivalent to the Inferior Oolite of British geologists. It corresponds fairly closely with the Lower and Middle Brown Jura of Quenstedt, and with the Dogger of Oppel. By means of the fossil ammonites the Bajocia strata have been subdivided into the following zones, in descending order:—

<table>

It should be remarked that some European geologists prefer
to include the Parkinsonia zone in the base of the overlying Bahonian (q.v.).

The Bajocian rocks of Europe are mostly limestones of various kinds, very frequently oolitic. At Bayeux, the type district, they are ferruginous oolites; in the Jura and Lorraine a coral limestone overlies a crinoidal variety; calcareous sandy and marly beds occur in Maine and Anjou; in Poitou the limestone is dolomitic and bears nodules of chert. Rocks of the same age, as recognized by their fossil contents, have a wide range; they are found in north Africa, Goa, Somaliland, German East Africa, and north-west Madagascar; through southern Europe they may be followed into Turkestan, and the Kotal-Maleri beds of the Upper Gondwana series of India may possibly belong to this stage. In South America they appear in Bolivia, Chile and Argentina; in North America, in British Columbia, Dakota, Mexico, Oregon and California. The Bajocian sea also included parts of New South Wales, New Zealand (Flag Hills beds?), Borneo and Japan, and it extended into the polar region of eastern Greenland and Franz Josef Land.

In addition to the ammonites already mentioned, the large belemnites (Megaleuthis giganteus) and terebratulas (T. perovalis) are worthy of notice; crinoids and corals were abundant, and so also were certain forms of Trigonia (T. costata), Pleurotomaria and Cidaris.

BAJOUR, or BAJZA, a small district peopled by Pathan races of Afghan origin, in the North-West Frontier Province of India. It is about 45 m. long by 20 broad, and lies at a high level to the east of the Kunar valley, from which it is separated by a continuous line of rugged frontier hills, forming a barrier easily passable at one or two points. Across this barrier the old road from Kabul to India ran before the Khyber Pass was adopted as the main route. Bajour is inhabited almost exclusively by Turkana (Tarkalanri) Pathans, sub-divided into Mamunds, Isazai, and Ismailzai, numbering together with a few Mohmands, about 100,000. To the south of Bajour is the wild mountain district of the Mohmands, a Pathan race. To the east, beyond the Panjkora river, are the hills of Swat, dominated by another Pathan race. To the north is an intervening watershed between Bajour and the small state of Dir; and it is over this watershed and through the valley of Dir that the new road from Malakand and the Punjab runs to Chitral. The drainage of Bajour flows eastwards, starting from the eastern slopes of the dividing ridge which overlooks the Kunar and terminating in the Panjkora river, so that the district lies on a slope tilting gradually downwards from the Kunar ridge to the Panjkora. In Bajour the chief town is Bajour, and the khan of Nawagai is under British protection for the safeguarding of the Chitral road. Jandol, one of the northern valleys of Bajour, has ceased to be of political importance since the failure of its chief, Umra Khan, to appropriate to himself Bajour, Dir, and a great part of the Kunar valley. It was the active hostility between the amir of Kabul (who claimed sovereignty of the same districts) and Umra Khan that led, firstly to the demarcation agreement of 1893 which fixed the boundary of Afghanistan in Kunar; and, secondly, to the invasion of Chitral by Umra Khan (who was no party to the settlement of the border) and the siege of the Chitral fort in 1895.

An interesting feature in Bajour topography is a mountain spur from the Kunar range, which curving eastwards culminates in the well-known peak of Koh-i-Mor, which is visible from the Peshawar valley. It was here, at the foot of the mountain, that Alexander found the ancient city of Nysa and the Nysaean colony, traditionally said to have been founded by Dionysus. The Koh-i-Mor has been identified as the Meros of Arrian's history—the three-peaked mountain from which the god issued. It is also supposed to mark that a section of the Kafir community of Kandesh still claim the same Greek origin as did the Nysaeans; still chant hymns to the god who sprang from Gir Nysa (the mountain of Nysa); whilst they maintain that they originally migrated from the Swat country to their present habitat in the Koh-i-Mor. Long after Buddhism had spread to Chitral, Gilgit, Dir and Swat, the Ningihar was still full of monasteries and temples, and the Peshawar valley was recognized as the seat of Buddhist learning, the Kafs or Nysaeans held their own in Bajour and in the lower Kunar valley, where Buddhism apparently never prevailed. It is probable that the invader Baber (who has much to say about Bajour) fought them there in the early years of the 16th century, when on his way to found the Mogul dynasty of India centuries after Buddhism has been crushed in northern India by the destroyer Mahmud.

The Gazetteers and Reports of the Indian government contain nearly all the modern information available about Bajour. The autobiography of Baber (by Leyden and Erskine) gives interesting details about the country in the 16th century. For the connexion between the Kafs and the ancient Nysaeans of Swat, see R. G. S. Journal, vol. vii., 1896.

BAJZA, JOSEPH (1804-1858), Hungarian poet and critic, was born at Szécsény in 1804. His earliest contributions were made to Kisfaludy's Aurora, a literary paper of which he was editor from 1830 to 1837. He also wrote largely in the Kritische Blätter, the Athenaeum, and the Pigvelmező or Observer. His criticisms on dramatic art were considered the best of these miscellaneous writings. In 1830 he published translations of some foreign dramas, Ausländische Bühnen, and in 1835 a collection of his own poems. In 1837 he was made director of the newly established national theatre at Pest. He then, for some years, devoted himself to his literary work, and published in succession the Historical Library (Történeti Könyvek), 6 vols., 1842-1845; the Modern Plutarch (Új Plutarch), 1845-1847; and the Universal History (Világörténet), 1847. These works are to some extent translations from German authors. In 1847 Bajza edited the journal of the opposition, Ellenör, at Leipzig, and in March 1848 Kossuth made him editor of his paper, Kossuth Hírlapja. In 1850 he was attacked with brain disease and died in 1858.

BAKALAI (BAKÁIÉ, BANGOUNÉ), a Bantu negroid tribe inhabiting a wide tract of French Congo between the river Ogowé and 2° S. They appear to be immigrants from the south-east, and have been supposed to be connected racially with the Galoa, one of the Mpongwe tribes and the chief river-people of the Ogowé. The Bakalai have suffered much from the incursions of their neighbours the Fang, also arrivals from the south-east, and it may be that they migrated to their present abode under pressure from this people at an earlier date. They are keen hunters and were traders in slaves and rubber; the slave traffic has been prohibited by the French authorities. Their women display considerable ingenuity in dressing their hair, often taking a whole day to arrange a coiffure; the hair is built up on a substructure of clay and a good deal of false hair is used. A coat of 26th of M of yellow pigment often completes the effect. The same colours are used to decorate the hut doors. The villages, some of which are fortified with palisades, are usually very dirty; chiefs and rich men own plantations which are situated at some distance from the village and to which their womenfolk are sent in times of war. The Bakalai of Lake Isanga cremate their dead; those of the Upper Ogowé throw the bodies into the river, with the exception of those killed in war. The body of a chief is placed secretly in a hut erected in the depths of the forest, and the village is deserted for that night, in some cases altogether; the slaves of the deceased are (or were) sacrificed, and his wives scourged and secluded in huts for a week. "Natural" deaths are attributed to the machinations of a sorcerer, and the poison-ordeal is often practised. Of their social organization little is known, but it appears that nearly all individuals refrain from eating the flesh of some particular animal.

BAKE, JAN (1787-1864), Dutch philologist and critic, was born at Leiden on the 1st of September 1787, and from 1817 to 1854 he was professor of Greek and Roman literature at the university. He died on the 26th of March 1864. His principal works are:—Posidonti Rhodii Reliquiae Doctrinae (1855); Chronices Circularis Doctrinae de Sublimitate (1820); Bibliotheca
Critica Nova (1825–1831) and Scholica Hypomnemata (1837–1862), a collection of essays dealing mainly with Cicero and the Attic orators; Cicero, De Legibus (1842) and De Oratore (1856); the Rhetorica of Apines and Longinus (1849).

His biography was written (in Dutch) by his pupil Bakhuizen van der Brink (1865); for an appreciation of his services to classical literature see L. Müller, Geschichte der klassischen Philologie in den Niederlanden (1869).

BAKER, SIR BENJAMIN (1840–1907), English engineer, was born near Bath in 1840, and, after receiving his early training in a South Wales ironworks, became associated with Sir John Fowler in London. He took part in the construction of the Metropolitan railway (London), and in designing the cylindrical vessel in which Cleopatra’s Needle, now standing on the Thames Embankment, London, was brought over from Egypt to England in 1877–1878. By this time he had already made himself an authority on bridge-construction, and shortly afterwards he was engaged on the work which made his reputation with the general public—the design and erection of the Forth Bridge. On the completion of this undertaking in 1890 he was made K.C.M.G., and, in the same year the Royal Society recognized his scientific attainments by electing him one of its fellows. Twelve years later at the formal opening of the Assan dam, for which he was consulting-engineer, he was created K.C.B. Sir Benjamin Baker, who also had a large share in the introduction of the system widely adopted in London of constructing intra-urban railways in deep tubular tunnels built up of cast iron segments, obtained an extremely large professional practice, ranging over almost every branch of civil engineering, and was more or less directly concerned with most of the great engineering achievements of his day. He was also the author of many papers on engineering subjects. He died at Pangbourne, Berks, on the 10th of May 1907.

BAKER, HENRY (1605–1774), English naturalist, was born in London on the 8th of May 1608. After serving an apprenticeship with a bookseller, he devised a system of instructing the deaf and dumb, by the practice of which he made a considerable fortune. It brought him to the notice of Daniel Defoe, whose youngest daughter Sophia he married in 1729. A year before, under the name of Henry Stonecastle, he was associated with Defoe in starting the Universal Spectator and Weekly Journal. In 1740 he was elected fellow of the Society of Antiquaries and of the Royal Society. He contributed many memoirs to the Transactions of the latter society, and in 1744 received the Copley gold medal for microscopic observations on the crystalization of saline particles. He was one of the founders of the Society of Arts in 1754, and for some time acted as its secretary. He died in London on the 25th of November 1774. Among his publications were The Microscope made Easy (1743), Employment for the Microscope (1753), and several volumes of verse, original and translated, including The Universe, a Poem intended to restrain the Pride of Man (1737). His name is perpetuated by the Bakerian lecture of the Royal Society, for the foundation of which he left by will the sum of £100.

BAKER, SIR RICHARD (1568–1644/5), author of the Chronicle of the Kings of England and other works, was probably born at Sissinghurst in Kent, and entered Hart Hall, Oxford, as a commoner in 1584. He left the university without taking a degree, studied law in London and afterwards travelled in Europe. In 1593 he was chosen member of parliament for Arundel, in 1594 his university conferred upon him the degree of M.A., and in 1597 he was elected to parliament as the representative of East Grinstead. In 1603 he was knighted by King James I, in 1620 he acted as high sheriff of Oxfordshire where he owned some property, and soon afterwards he married Margaret, daughter of Sir George Mainwaring, of Ightfield, Shropshire. By making himself responsible for some debts of his wife’s family, he was reduced to great poverty, which led to the seizure of his Oxfordshire property in 1625. Quite penniless, he took refuge in the Fleet prison in 1635, and was still in confinement when he died on the 18th of February 1644 (1645). He was buried in the church of St Bride, Fleet Street, London.

During his imprisonment Baker spent his time mainly in writing. His chief work is the Chronicle of the Kings of England from the Time of the Romans’ Government unto the Death of King James I (1643; and many subsequent editions). It was translated into Dutch in 1649, and was continued down to 1658 by Edward Philips, a nephew of John Milton. For many years the Chronicle was extremely popular, but owing to numerous inaccuracies its historical value is very slight. Baker also wrote Cato Variegeticus or Cato’s Moral Distichs, Translated and Paraphrased by Sir Richard Baker, Knight (London, 1636); Meditations on the Lord’s Prayer (1637); Translation of New Epistles by Monssieur D’Balzac (1638); Apology for Laymen’s Writing in Divinity, with a Short Meditation upon the Fall of Lucifer (1641); Motives for Prayer upon the seven days of ye weke (1642); a translation of Malvezi’s Discourses upon Cornelius Tacitus (1642), and Theatrum Redivivum, or The Theatre Vindicated, a reply to the Histo-Ristis of William Prynne (1642). He also wrote Meditations upon several of the psalms of David, which have been collected and edited by A. B. Grosart (London, 1882).

BAKER, SIR SAMUEL WHITE (1821–1893), English explorer, was born in London on the 8th of June 1821. He was educated partly in England and partly in Germany. His father, a West India merchant, destined him for a commercial career, but a short experience of office proved to him to be entirely unsuited to such a life. On the 3rd of August 1843 he married Henrietta Biddulph Martin, daughter of the rector of Maisemore, Gloucestershire, and after two years in Mauritius the desire for travel took him in 1846 to Ceylon, where in the following year he founded an agricultural settlement at Nuwara Eliya, a mountain health-resort. Aided by his brother, he brought emigrants thither from England, together with choice breeds of cattle, and before long the new settlement was a success. During his residence in Ceylon he published, as a result of many adventurous hunting expeditions, The Rifle and the Hound in Ceylon (1853), and two years later Eight Years’ Wanderings in Ceylon (1855). After a journey to Constantinople and the Crimea in 1856, he found an outlet for his restless energy by undertaking the supervision of the construction of a railway across the Dobrudja, connecting the Danube with the Black Sea. After its completion he spent some months in a tour in south-eastern Asia and Asia Minor. It was during this time that he met in Hungary the lady who (in 1860) became his second wife, Florence, daughter of Finnan von Sass, his first wife having died in 1855. In March 1861 he started upon his first tour of exploration in central Africa. This, in his own words, was undertaken “to discover the sources of the Nile, with the hope of meeting the East African expedition under Captains Speke and Grant somewhere about the Victoria Lake.” After a year spent on the Sudan-Abyssinian border, during which time he learnt Arabic, explored the Atbara and other Nile tributaries, and proved that the Nile sediment came from Abyssinia, he arrived at Khartum, leaving that city in December 1862 to follow up the course of the White Nile. Two months later at Gondokoro he met Speke and Grant, who, after discovering the source of the Nile, were following the river to Egypt. Their success made him fear that there was nothing left for his own expedition to accomplish; but the two explorers generously gave him information which enabled him, after separating from them, to achieve the discovery of Albert Nyanza, of whose existence credible assurance had already been given to Speke and Grant. Baker first sighted the lake on the 14th of March 1864. After some time spent in the exploration of the neighbourhood, during which Baker demonstrated that the Nile flowed through the Albert Nyanza—of whose size he formed an exaggerated idea—he started upon his return journey, and reached Khartum after many checks in May 1865. In the following October he returned to England with his wife, who had accompanied him throughout the whole of the perilous and arduous journey. In recognition of the achievements by which Baker had indissolubly linked his name...
BAKER, T.—BAKER CITY

with the solution of the problem of the Nile sources, the Royal Geographical Society awarded him its gold medal, and a similar distinction was bestowed on him by the Paris Geographical Society. In August 1866 he was knighted. In the same year he published The Albert N'yanza, Great Basin of the Nile, and Explorations of the Nile Sources, and in 1867 The Nile Tributaries of Abyssinia, both books quickly going through several editions. In 1868 he published a popular story called Cast up by the Sea. In 1896 he attended the prince of Wales, afterwards King Edward VII., in a tour through Egypt. In the same year, at the request of the khedive Ismail, Baker undertook the command of a military expedition to the equatorial regions of the Nile, with the object of suppressing the slave-trade there and opening the way to commerce and civilization. Before starting from Cairo with a force of 1,000 Egyptian troops—many of them discharged convicts—he was given the rank of pasha and major-general in the Ottoman army. Lady Baker, as before, accompanied him. The khedive appointed him governor-general of the new territory for four years at a salary of £10,000 a year; and it was not until the expiration of that time that Baker returned to Cairo, leaving his work to be carried on by the new governor, Colonel Charles George Gordon. He had to contend with innumerable difficulties—the blocking of the river by sand, the bitter hostility of officials interested in the slave-trade, the armed opposition of the natives—but he succeeded in planting in the new territory the foundations upon which others could build up an administration. He returned to England with his wife in 1874, and in the following year purchased the estate of Sandford Orleigh in South Devon, where he made his home for the rest of his life. He published his narrative of the central African expedition under the title of Ismailia (1874). Cyprus as I saw it in 1879 was the result of a visit to that island. He spent several winters in Egypt, and travelled in India, the Rocky Mountains and Japan in search of big game, publishing in 1890 Wild Beasts and their Ways. He kept up all which bore an vigorous correspondence with many of his colleagues upon Egyptian affairs, strongly opposing the abandonment of the Sudan and subsequently urging its reoccupation. Next to these, questions of maritime defence and strategy chiefly attracted him in his later years. He died at Sandford Orleigh on the 30th of December 1893.

BAKER, THOMAS (1656-1740), English antiquary, was born on the 14th of September 1656 at Lancaster, Durham. He was the grandson of Colonel Baker of Crook, Durham, who won fame in the civil war by his defence of Newcastle against the Scots. He was educated at the free school at Durham, and proceeded thence in 1672 to St John's College, Cambridge, where he afterwards obtained a fellowship. Lord Crew, bishop of Durham, collated him to the rectory of Long-Newton in his diocese in 1687, and intended to give him that of Sedgfield with a prebend had not Baker insisted on his dismissal before refusing to read James II's Declaration of Indulgence. The bishop who disgraced him for this refusal, and who was afterwards specially excepted by William's Act of Indemnity, took the oaths to that king and kept his bishopric till his death. Baker, on the other hand, though he had opposed James, refused to take the oaths to William: he resigned Long-Newton on the 1st of August 1690, and retired to St John's, in which he was protected till the 20th of January 1716-1717, when he and one and twenty others were deprived of their fellowships. After the passing of the Registering Act in 1723, he could not be prevailed on to comply with its requirements by registering his annuity of £40, although that annuity, left him by his father, with £20 per annum from his elder brother's collieries, was now his whole subsistence. He retained a lively sense of the injuries he had suffered; and inscribed himself in all his own books, as well as in those which belonged to the college, in his own hand, Rescissus ejectus, and in some Rector ejectus. He continued to reside in the college as commoner-master till his sudden death from apoplexy on the end of July 1740. The whole of his valuable books and manuscripts he bequeathed to the university. The only works he published were, Reflections on Learning, showing the Insufficiency thereof in its several particulars, in order to evince the usefulness and necessity of Revelation (London, 1709-1710) and the preface to Bishop Fisher's Funeral Sermon for Margaret, Countess of Richmond and Derby (1708)—both without his name. His valuable manuscript collections relative to the history and antiquities of the university of Cambridge, amounting to thirty-nine volumes in folio and three in quarto, are divided between the British Museum and the public library at Cambridge;—the former possessing twenty-three volumes, the latter sixteen, in folio and three in quarto.

The life of Baker was written by Robert Masters (Camb., 1784), and by Horace Walpole in the quarto edition of his works.

BAKER, VALENTINE [Baker Pasha] (1837-1887), British soldier, was a younger brother of Sir Samuel Baker (q.v.). He was educated at Gloucester and in Ceylon, and in 1848 entered the Ceylon Rifles as an ensign. Soon transferred to the 12th Lancers, he saw active service with that regiment in the Kaffir War 1872-1873. In the Crimean War Baker was present at the action of Traktir (or Tchernaya) and at the fall of Sevastopol, and in 1859 he became major in the 10th Hussars, succeeding only a year later to the command. This position he held for thirteen years, during which period the highest efficiency of his men was reached, and outside the regiment he did good service to his arm by his writings. He went through the wars of 1866 and 1870 as a spectator with the German armies, and in 1873 he started upon a famous journey through Khorasan. Though he was unable to reach Khiva the results of the journey afforded a great deal of political, geographical and military information, especially as to the advance of Russia in central Asia. In 1874 he was back in England and took up a staff appointment at Aldershot. Less than a year later Colonel Baker's career in the British army came to an untimely end. He was arrested on a charge of indecent assault upon a young woman in a railway carriage, and was sentenced to a year's imprisonment and a fine. His dismissal from the service was an inevitable consequence; it must be stated, however, that the view taken of the circumstances by good authorities was that Baker's conduct, when judged by conventional standards, admitted of considerable extenuation. He himself never opened his mouth in self-defence. Two years later, having meanwhile left England, he entered the service of Turkey in the war with Russia. At first in a high position in the gendarmerie, he was soon transferred to Mehmet's staff, and thence took over the command of a division of infantry. With this division Baker sustained the brilliant rearguard action of Tashkessen against the troops of Gourko. Promoted Pérès (lieutenant-general) for this feat, he continued to command Suleiman's rearguard with distinction. After the peace he was employed in an administrative post in Armenia, where he remained until 1882. In this year he was offered the command of the newly formed Egyptian army, which he accepted. On his return from his duties in Egypt he briefly entered Parliament, and in 1893 obtained the command of the Egyptian police. In this post he devoted by far the greater amount of his energy to the training of the gendarmerie, which he realized would be the reserve of the purely military forces.

When the Sudan War broke out, Baker, hastening with 3,500 men to relieve Tokar, encountered the enemy under Osman Digna at El Teb. His men became panic-stricken at the first rush and allowed themselves to be slaughtered like sheep. Baker himself with a few of his officers succeeded by hard fighting in cutting a way out, but his force was annihilated. British troops soon afterwards arrived at Suakin, and Sir Gerald Graham took the offensive. Baker Pasha accompanied the British force, and guided it in its march to the scene of his defeat, and at the desperately-fought second battle of El Teb he was wounded. He remained in command of the Egyptian police until his death in 1893. His works may be mentioned under Defences (1860), War in Bulgaria, a Narrative of Personal Experience (London, 1879), Clouds in the East (London, 1876).

BAKER CITY, a city and the county-seat of Baker county, Oregon, U.S.A., about 337 m. E. by S. of Portland. Pop. (1890,
BAKEWELL—BAKING 229

2664; (1900) 6663 (1017 foreign-born); (1910) 6742. The city is served by the Oregon Railroad & Navigation Company, and by the Stumpert Valley railway, a short line (62 m.), extending from Baker City to Austin, Oregon. Baker City lies in the valley of Powder river, at the base of the Blue Mountains, and has an elevation of about 3440 ft. above the sea. It is the largest city in eastern Oregon, and is the centre of important mining, lumber, farming and live-stock interests. It was laid out as a town in 1865, became the county-seat in 1868, and was chartered as a city in 1874. The county and the city were named in honour of Edward Dickinson Baker (1811-1861), a political leader, orator and soldier, who was born in London, England, was taken to the United States in 1815, was a representative in Congress from Illinois in 1845-1846 and 1849-1851, served in the Mexican War as a colonel (1846-1847), became a prominent lawyer in California and later in Oregon, was a Republican member of the United States Senate in 1860-1861 and was killed at Ball's Bluff, Virginia, on the 21st of October 1861, while serving as a colonel in the Federal army.

BAKEWELL, ROBERT (1725-1795) English agriculturist, was born at Dishley, Leicestershire, in 1725. His father, a farmer at the same place, died in 1760, and Robert Bakewell then took over the management of the farm. For many years he had been familiar with the farm, and he had already acquired a wide theoretical knowledge of agriculture and stock-breeding; and this knowledge he now put to practical use at Dishley. His main object was to improve the breed of sheep and oxen, and in this he was highly successful, his new Leicestershire breed of sheep attaining within little more than half a century an international reputation, while the Dishley cattle (also known as the new Leicestershire long-horn) became almost as famous. He extended his breeding experiments to horses, producing a new and particularly useful type of farm-horse. He was the first to establish the trade in ram-letting on a large scale, and founded the Dishley Society, the object of which was to ensure purity of breed. The value of his own stock was quickly recognized, and in one year he made 1200 guineas from the letting of a single ram. Bakewell's agricultural experiments were not confined to stock-breeding. His reputation stood high in every detail of farm-management, and as an improver of grass land by systematic irrigation he had no rival. He died on the 1st of October 1795.

BAKEWELL, ROBERT (1768-1843) English geologist, was born in 1768. He was an able observer, and deserving of mention as one of the earliest teachers of general and practical geology. His Introduction to Geology (1813) contained much sound information, and reached a fifth edition in 1838. The second edition was translated and published in Germany, and the third and fourth editions were reprinted in America by Professor Silliman of Yale College. Bakewell as author also of an Introduction to Mineralogy (1816), and of Travels comprising Observations made during a Residence in the Tarentaise, &c. (2 vols., 1823). He died at Hampstead on the 15th of August 1843.

BAKEWELL, a market-town in the western parliamentary division of Derbyshire, England, on the river Wye, 25 m. N.N.W. of Derby, on the Midland railway. Pop. of urban district (1901) 2850. The church of All Saints is mentioned in Domesday, and tradition ascribes the building of its nave to King John, while the western side of the tower must be older still. Within are some admirable specimens of encaustic tiles, and several monuments of the Vernon and Manners families; while an ancient ruinous rood-stone stands in the churchyard. Zinc and copper are worked in the neighbourhood. The cotton manufacture was established in the town by Sir Richard Arkwright. Bakewell is noted for a chalybeate spring, of use in cases of chronic rheumatism, and there are baths attached to it. A kind of jam-cake, called a "Bakewell pudding," gives another sort of fame to the place. The almshouses, known as St John's hospital, were founded in 1602; and in 1637 a free grammar school was endowed by Lady Grace Manns. Among modern buildings may be mentioned the Bakewell and High Peak Institute, and the town hall and museum. On Castle Hill, in the vicinity, are the remains of an earthwork, said to have been raised by Edward the Elder in 924. Within the parish are included the mansions of Burton Closes and Castle Hill. Two miles from the town, amidst beautiful gardens and meadows, is Haddon Hall. To the east lies the magnificent domain of Chatsworth. The scenery of the neighbourhood, in both the Wye and the Derwent valleys, is very beautiful; the village of Eyam (pronounced Eem) near the Derwent may be noticed as specially picturesque. The plague of 1665, carried hither from London, almost depopulated this village, and the name of the rector, William Mompesson, attracted wide notice on account of his brave attempts to combat the outbreak.

BAKCHI-SARAI (Turk. for "garden-palace"), a town of Russia, in the government of Taurida, situated in a narrow gorge in the Crimea, 20 m. by rail S.S.W. of Simferopol. From the close of the 15th century down to 1783 it was the residence of the Tatars of the Crimea; and its streets wear a decidedly oriental look. The principal building, the palace, or Khan-sarai, was originally erected in 1549 by Abdul-Sahal-Ghirai, destroyed in 1736, and restored at Potemkin's command for the reception of Catherine II. Attached to it is a mausoleum, which contains the tombs of many of the khans. There are in the place no fewer than thirty-six mosques. The population consists for the most part of Turks. Turchi manufactures morocco, sheep-skin cloaks, and agricultural implements, spades and cutters. Pop. (1857) 12,055. Two and a half miles to the east is Chufut-Kaleh (or Jews' city), formerly the chief seat of the Karaites Jews of the Crimea, situated on lofty and almost inaccessible cliffs; it is now deserted except by the rabbi. Between Bakchichi-sarai and Chufut-kaleh is the Eupseksinsky monastery, clinging like a swallow's nest to the face of the cliffs, and the scene of a great pilgrimage on the 15th (29th) of August every year.

BAKHMET, a town of Russia, in the government of Ekaterinoslav, near the river from which it derives its name, 136 m. E. of the town of Ekaterinoslav. It owed its origin in the latter half of the 17th century to the discovery of salt-springs, and now produces coal, salt, alabaster and quicksilver, and manufactures steel rails. Pop. (1857) 19,416.

BAKHTIARI, one of the great nomadic tribes of Persia, whose camping-grounds are in the hilly district, known as the Bakhtiari province. This province extends from Chaharmahal (west of Isfahan) in the E. to near Shushter in the W., and separated from Luristan by the former. Bakhtiari numbers about 92,500 and Luristan 92,000, but only 12,955. The Kirdi tribe, with which the Bakhtiari are divided, into the two great divisions Haft-lang and Chahar-lang, and a number of branches and clans, and were known until the 15th century as the "Great Lurs," the "Little Lurs" being the tribes settled in the district now known as Luristan, with Khoremsaberd as capital. According to popular tradition the Lurs originally came from Syria in the 10th century, but it is now held that they were in Persia long, perhaps fifteen centuries, before. They speak the Lur language, a Persian dialect. The Bakhtiari number about 38,000 or 40,000 families, under 200,000 souls, while the area of the district occupied by them is about 25,000 sq. m. In the middle of the 10th century they could put 20,000 well-equipped horsemen into the field, but in consequence of misrule and long-lasting feuds between the different branches, which the government often fostered, or even instigated, the district has become poor, and it would now be difficult to find 4000 horsemen. The province is under the governor-general of Arabistan, and pays a yearly tribute of about £5000. The chiefs of the Bakhtiari in 1867 had obtained the oprah's permission for improving the road between Shushter or Ahvaz and Isfahan, an iron suspension bridge with a span of 120 ft. was erected over the Karun river at Gudar D. Buélte; another, with a span of 70 ft., over the Bázút river at Pul-i Amārāt; and a stone bridge over the Karun at Do-pu-lán.

BAKING, the action of the verb "to bake," a word, in various forms, common to Teutonic languages (cf. Ger. backen), meaning to cook by dry heat. "Baking" is thus primarily applied to
BAKIS—BAKU

the process of preparing bread, and is also applied to the hardening by heat or "firing" of pottery, earthenware or bricks. (See BREAD, CERAMICS and BRICK.)

BAKIS (i.e. "speaker," from bākī), a generic name for the inspired prophets and dispensers of oracles who flourished in Greece from the 8th to the 6th century B.C. Sudins mentions three: a Boeotian, an Arcadian and an Athenian. The first, who was the most famous, was said to have been inspired by the nymphs of the Corycian cave. His oracles, of which specimens are extant in Herodotus and Pausanias, were written in hexameter verse, and were considered to have been strikingly fulfilled. The Arcadian was said to have cured the women of Sparta of a fit of madness. Many of the oracles which were current under his name have been attributed to Onomacritus.

Herodotus viii. 20, 77, ix. 43; Pausanias iv. 27, ix. 17, x. 12; School of Arabic architecture of the 9th century. (See Göttingen, Opuscula Academica (1886).

BAKÓCZ, TAMÁS, CARDENAL (1444—1521), Hungarian ecclesiastic and statesman, was the son of a wagoner, adopted by his uncle, who trained him for the priesthood and whom he succeeded as rector of Tété (1480). Shortly afterwards he became one of the secretaries of King Matthias I., who made him bishop of Györ and a member of the royal council (1490). Under Wladislaus II. (1490—1516) he became successively bishop of Eger, the richest of the Hungarian sees, archbishop of Esztergom (1497), cardinal (1500), and titular patriarch of Constantinople (1516). From 1490 to his death in 1521 he was the leading statesman of Hungary and mainly responsible for her foreign policy. It was solely through his efforts that Hungary did not accede to the league of Cambray, was consistently friendly with Venice, and formed a family compact with the Habsburgs. He was also the only Magyar prelate who seriously aspired to the papal throne. In 1515, on the death of Julius II., he went to Rome for the express purpose of bringing about his own election as pope. He was received with more than princely pomp, and all but succeeded in his design, thanks to his extraordinary adroitness and the command of an almost unlimited bribing-fund. But Venice and the emperor played him false, and he failed. He returned to Hungary as papal legate, bringing with him the bull of Leo X. proclaiming a fresh crusade against the Turks. But the crusade degenerated into a jacquerie which ravaged the whole kingdom, and much discredited Bakócze. He lost some of his influence at first after the death of Wladislaus, but continued to be the guiding spirit at court, till age and infirmity confined him almost entirely to his house in the last three years of his life. Bakócze was a man of great ability but of no moral principle whatever. His whole life was a tissue of treachery. He was false to his benefactor Matthias, false to Matthias's son János Corvinus (g.v.), whom he chicaned out of the throne, and false to his accomplice in that transaction, Queen Beatrix. His rapacity disgusted even an age in which every one could be bought and sold. His attempt to incorporate with other dioceses of Transylvania with his own primatial province was one of the principal causes of the spread of the Reformation in Hungary. He left a fortune of many millions. His one redeeming feature was a love of art; his own cathedral was a veritable Pantheon.

See Vilmos Fraknol, Tamás Bakócze (Hung.) (Budapest, 1886). (R. N. B.)

BAKRI [Abū 'Ubayd 'Abdallāh ibn 'Abd ul-'Azīz al-Bakrī], (1040—1094), Arabian geographer, was born at Cordova. His best-known work is the dictionary of geographical names which occur in the poets, with an introduction on the seats of the Arab tribes, has been edited by F. Wüstefeld (Göttingen, 1876—1877). Another of his works was a general geography of the world, which exists in manuscript. The part referring to North Africa was edited by M. de Siane (Algiers, 1857). See C. Brockelmann's Gesch. der Arab. Literatur, (Weimar, 1898), vol. i. p. 476.

BAKU, a government of Russian Transcaucasia, stretching along the west coast of the Caspian Sea from 40° 50' to 38° 30' N. lat., and bounded on the W. by the government of Elisavetpol and the province of Daghestan, and on the S. by Persia. It includes the Kuba plain on the north-east slope of the Caucasus; the eastern extremity of that range from the Shad-dagh (13,900 ft.) and the Bazarduz (14,277 ft.) to the Caspian, where it terminates in the Apsheron peninsula; the steppes of the lower Kura and Aras on the south of the Caucasus, and a narrow coast-belt between the Anti-Caucasus and the Caspian. The last-mentioned region lies partly round the Kizil-agach Bay, opening to the south. Area of government, 15,772 sq. m. Both slopes of the Caucasus are very fertile and well irrigated, with fine forests, fields of rice and other cereals, and flourishing gardens. The steppes of the Kura are also fertile, but require artificial irrigation, especially for cotton. In addition to agriculture and cattle-breeding, the vine and mulberry are extensively grown. The Apsheron peninsula is dry and bare of vegetation; but within it are situated the famous petroleum wells of Baku. These, which go down to depths of 700 to 1700 ft., yield crude naphtha, from which the petroleum or kerosene is distilled; while the heavier residue (masal) is used as lubricating oil and for fuel, for instance in the locomotives of the Transcaspian railway. Whereas in 1863 the output was only 5,500 tons of crude naphtha, in 1904 it amounted to 8,033,600 tons; but business was much injured by a serious fire in 1905. The oil-fields lie around the town of Baku: the largest, that of Bakakhany-Sabunchi-Komna (6 sq. m.), is 83/4 m. north of the town; that of Bibi-Eybat, is 53/4 m. south; the "black town" (Nohel's) is 2 m. south-east; and beyond the last names is the "white town" (Rothschild's). The lighter oil is conveyed to Batum on the Black Sea in pipes, and is there shipped for export; the heavier oils reach the same port and the ports of Novorossiysk and Poti, also on the Black Sea, in tank railway-cars. At Surakhami, 13 m. east of the town, is the now disused temple of the Parsee fire-worshippers, who were attracted thither by the natural fountains of inflammable gas.

The government is divided into six districts, the chief towns of which are Baku (the capital of the government), Geok-chai (pop. 22,477 in 1897), Kuba (15,346), Lenkoran (8,078), Salyamy (10,168), in district of Jevat, and Shemakha (20,008). The population numbered 828,571 in 1897, of whom the major part were Tatars; other races were Russians, the Iranian tribes of the Tates (89,376), and Talysh (34,904), Armenians (52,233) and the Caucasian mountaineers known as Kurins.

BAKU, the chief town of the government of the same name, in Russian Transcaucasia, on the south side of the peninsula of Apsheron, in 40° 21' N. and 49° 56' E. It is connected by rail with the south Russian railway system at Beslan, the junction for Vladivkovsk (400 m.), via Derbent and Petrovsk, with Batum (560 m.) and Poti (536 m.) on the Black Sea via Tiflis. A long stone quay next the harbour is backed by the new town climbing up the slopes behind. To the west is the old town, consisting of steep, narrow, winding streets, and presenting a decidedly oriental appearance. Here are the ruins of a palace of the native khans, built in the 16th century; the mosques of the Persian shahs, built in 1595 and now converted into an arsenal; near the sea the "maiden's tower," transformed into a lighthouse; and not far from it remains of ancient walls projecting above the sea, and showing traces of Achaemenian architecture. The town is one of the most ancient in the world. From the 9th to the 16th centuries. Beside the harbour are engineering works, dry docks and barrack stores and workshops belonging to the Russian Caspian fleet. Besides the petroleum refineries the town possesses oil-works (for fuel), flour-mills, sulphuric acid works and tobacco factories. Owing to its excelent harbour Baku is a chief depot for merchandise coming from Persia and Transcahsia—raw cotton, silk, rice, wine, fish, dried fruit and timber—and for Russian manufactured goods. The climate is extreme, the mean temperature for the year being 58° F., for January 38°, for July 80°; annual rainfall 9-4 in. A wind of exceptional violence blows sometimes from the N.N.W. in winter. Pop. (1860) 13,351; (1877) 112,233; (1900) 175,133. The town is mentioned by the Arab geographer, Masudi, in the 11th century. From 1150 it was in the possession of the Persians. The Russians captured it from them in 1733, but restored it in 1735; it was occupied by the Russians in 1860. In 1904—1905,
in consequence of the general political anarchy, serious conflicts took place here between the Tatars and the Armenians, and two-thirds of the Balakhan and Bibi-Eybat oil-works were burned.

See Marvin, The Region of the Eternal Fire (ed. 1891) and J. D. Henry, Bakunin, an Eventful History (1900).

BAKUNIN, MIKHAIL (1814-1876). Russian anarchist, was born of an aristocratic family at Torjok, in the government of Tver, in 1814. As an officer of the Imperial Guard, he was service in his commission from a disgust of despotism aroused by witnessing the repressive methods employed against the Poles. He proceeded to Germany, studied Hegel, and soon got into touch with the leaders of the young German movement in Berlin. Thence he went to Paris, where he met Proudhon and George Sand, and also made the acquaintance of the chief Polish exiles. From Paris he journeyed to Switzerland, where he resided for some time, taking an active share in all socialistic movements. While in Switzerland he was ordered by the Russian government to return to Russia, and on his refusal his property was confiscated. In 1848, on his return to Paris, he published a violent tirade against Russia, which caused his expulsion from France. Bakunin's revolutionary movement of 1848 gave him the opportunity of entering upon a violent campaign of democratic agitation, and for his participation in the Dresden insurrection of 1849 he was arrested and condemned to death. The death sentence, however, was commuted to imprisonment for life, and he was eventually handed over to the Russian authorities, by whom he was imprisoned and finally sent to eastern Siberia in 1855. He received permission to remove to the Amur region, whence he succeeded in escaping, making his way through Japan and the United States to England in 1861. He spent the rest of his life in exile in western Europe, principally in Switzerland. In 1869 he founded the Social Democratic Alliance, which, however, dissolved in the same year, and joined the International (q.v.). In 1870 he attempted a rising at Lyons on the principles afterwards exemplified by the Paris Commune. At the Hague congress of the International in 1872 he was outvoted and expelled by the Marx party. He retired to Lugano in 1873 and died at Bern on the 13th of June 1876.

Nothing can be clearer or more frank and comprehensive in its destructiveness than the revolutionary anarchism of Bakunin. He rejects all the ideal systems in every name and shape, from the idea of God downwards; and every form of external authority, whether emanating from the will of a sovereign or from universal sufragé. “The liberty of man,” he says in his Dieu et I État (published posthumously in 1882) “consists solely in this, that he obeys the laws of nature, because he has himself recognized them as such, and not because they have been imposed upon him externally by any foreign will whatsoever, human or divine, collective or individual.” In this way will the whole problem of freedom be solved. That natural laws be ascertained by scientific discovery, and the knowledge of them be universally diffused among the masses. Natural laws being thus recognized by every man for himself, he cannot but obey them, for they are the laws also of his own nature; and the need for political organization, administration and legislation will at once disappear. Nor will he admit of any privileged position or class, for “it is the peculiarity of privilege and of every privileged position to kill the intellect and heart of man. The privileged man, whether he be privileged politically or economically, is a man deprived in intellect and heart.” “In a word, we object to all legislation, all authority, and all influence, privileged, patented, official and legal, even when it has proceeded from universal suffrage, convinced that it must always turn to the profit of a dominating and exploiting minority, against the interests of the immense majority enslaved.” Bakunin's methods of realizing his revolutionary programme are not less frank and destructive than his principles. The revolutionist, as he would recommend him to be, is a consecrated man, who will allow no private interests or feelings, and no scruples of religion, patriotism or morality, to turn him aside from his mission, the aim of which is by all available means to overthrow the existing society. (See Anarchism.)

BA-KWIRI, a Bantu nation of German Cameroon, West Africa. According to tradition they are migrants from the eastward. The "Brushmen," for that is the meaning of their name, are grouped in about sixty separate clans. They are a lively intelligent people, brave fighters and daring hunters, and in their love of songs, music and elocution are superior to many negro races. Their domestic affections are strongly developed. Their chief physical peculiarity is the great disparity between the size and complexion of the sexes, most of the women being much shorter and far lighter in colour than the men. The Ba-Kwiri are generous and open-handed among themselves; but the law of blood for blood is mercilessly fulfilled, even in cases of accidental homicide. Their religion is ancestor-worship blended with witchcraft and magic. They believe in good and evil spirits, those of the forests and seas being especially feared. In common with their neighbours the Dualla (q.v.) the Ba-Kwiri possess a curious drum language. By drum-tapping news is conveyed from clan to clan. Slaves and women are not allowed to master this language, but all the initiated are bound to repeat it so as to pass the messages on. The Ba-Kwiri have also a horn language peculiar to themselves.

BA-BAAM, a district of the Red Sea province of Yemens. It is bounded on the north by Zangab, on the east by the Shaffarm mountains, on the south by the Persian Gulf, and on the west by the Gulf of Tadjura. The principal town is the Babain (q.v.).

Balaam, the son of Beor, was a Gentile seer; he appears in the history of the Israelites during their sojourn in the plains of Moab, east of Jordan, at the close of the Forty Years' wandering, shortly before the death of Moses and the crossing of the Jordan. Israel had conquered two kings of eastern Palestine—Shish, king of the Amorites, and Og, king of Bashan. Balak, king of Moab, became alarmed, and sent for Balaam to curse Israel; Balaam came after some hesitation, but when he sought to curse Israel Yahweh compelled him to bless them.

The main passage concerning Balaam in Num. xxii-xxvi.; it consists of a narrative which serves as a framework for seven oracular poems, the first four being of some length and the last three very brief. The story is doubtless based on ancient traditions, current in various forms; the Old Testament references are not usually connected.

The narrative in Num. xxxi, ff. is held to be compiled with editorial additions from the two ancient documents (900-700 B.C.) commonly denoted by the symbols J and E. The distribution of the material between the two documents is uncertain; but some such scheme as the following is not improbable. The references to portions of which is especially uncertain are placed in brackets ().

The present narrative, therefore, is not really a single continuous story, but may be resolved into two older accounts. In combining these two and using them as a framework for the poems, the compilers have altered, added and omitted. Naturally, when both documents made statements which were nearly identical, one might be omitted; so that neither account need be given in full in the composite passage. The two older accounts,
as far as they are given here, may have some weight thus: restorations of supposed omissions are given in square brackets. 22-35a to "Balaam," also "Go" and "So Balaam went." Nevertheless Balaam sets out with two servants to go to Balak, but the Angel of Yahweh meets him. At first the Angel is only seen by the ass, which arouses Balaam's anger by its efforts to avoid the Angel. The ass is miraculously enabled to speak to Balaam. Yahweh at last enables Balaam to see the Angel, who tells him that he would have slain him but for the ass. Balaam offers to go back, but is told to go on.

Speaking animals are a common feature of folklore: the only other case in the Old Testament is the serpent in Eden. Maimonides suggested that the episode of the Angel and the conversation with the ass is an account of a vision: similar views have been held by E. W. Hengstenberg and other Christian scholars. Others, e.g. Volz, see Balaam as the "impious Prophet of the Euphrates" (Balaam?), regard the account of the ass speaking as figurative; the ass brayed, and Balaam translated the sound into words. The ordinary literal interpretation is more probable; but it does not follow that the author of the Pentateuch intended the story to be taken as historical in its details. It need hardly be said that the exact accuracy of such narratives is not an essential part of the Christian faith; no such doctrine is laid down by the creeds and confessions.

Balaam meets Balak and they go together [and offer sacrifices]. Balaam, however, blesses Israel by divine inspiration; Balak remonstrates, but Balaam reminds him of his message and again blesses Israel. Then Balaam is sent back home. (For the relation of the poems to Balaam's narrative, see below.)

(ii) E. xxii. 36, 37 to Pethor, which is by the river," 9-10, 12-16, 19-21, 374a, to "unto me," 38. Balak, king of Moab, alarmed at the conquests of Israel, sends the princes of Moab to Balaam at Pethor on the Euphrates, that he may come and curse Israel.

A. Jeremias, Das Alte Testament im Lichte des alten Orients, p. 278, adopts Marqart's view that the "Rivers" (nahar) is the so-called Amuq, or Euphrates, the southern frontier of Judea. So too Winckler, in the new edition of E. Schrader's Die Keilinschriften und das Alte Testament. It has been usual to keep nahar and take it in its ordinary sense when used absolutely, i.e. the Euphrates, and to identify Pethor with a Pšir, as a tributary of the Euphrates, mentioned in an inscription of Shalmaneser I. Deut. xxii. 4 places Pethor in Mesopotamia.

God appears to him in a dream and forbids him to go. The princes return and report to Balak, who sends them back to put further pressure on Balaam. God in another dream permits him to go, on condition that he speaks what God tells him. He goes with the princes of Moab. Balak meets them, and Balaam warns him that he can only speak what God tells him.

xxii. 40, 41, xxiii. 1-6, 11-17. Balak offers sacrifices, but Yahweh inspires Balaam with a blessing on Israel. Balak reproaches Balaam, and Balaam explains. They try to get a more favourable result by sacrificing on a different spot, and by placing Balaam on the top of Pisgah to view Israel, but he is again compelled to bless Israel. Further remonstrances and explanations [Balaam goes home]. (For the relation of the poems to Balaam's narrative, see below.)

Deut. xxiii. 3-6 summarizes Balaam's account of this incident, adding, however, that the Annamites were associated with the Moabites, possibly an imperfect reminiscence of the reference to Ammon in J. Joshua, in his farewell speech to the Israelites, also refers to this episode. The Priestly Code has a different story of Balaam, in which he advises the Midianites how they may bring disaster on Israel by seducing the people. 1 Quoted Neh. xiii. 1. 2 Josh. xxiv. 9, 10. E. cf. Micah vi. 5. 3 Num. xxxi. 8 (quoted Josh. xiii. 16). These references are not necessarily inconsistent with JE; but they are probably based on an independent tradition. The date of the Priestly Code is ca. 400 B.C.

from their loyalty to Yahweh. Later on he is slain in battle, fighting in the ranks of Midian.

It is often supposed that the name of the king of Edom, Bela, son of Beor, is a corruption of Balaam, and that, therefore, one form of the tradition made him a king of Edom.

The Poems fall into two groups: the first four, in xxiii. 1-xxiv. 19, are commonly regarded as ancient lyrics of the early monarchy, perhaps in the time of David or Solomon, which JE and E inserted in their narrative. Some recent critics, however, are inclined to place them in the post-exilic period, in which case a late editor has substituted them for earlier, probably less edifying, oracles. But the features which are held to indicate late date may be due to editorial revision.

The first two are found in an E setting, and therefore, if ancient, formed part of E.

The First, xxiii. 7-10, prophesies the unique exaltation of Israel, and its countless numbers.

The Second, xxiii. 18-24, celebrates the moral virtue of Israel, the monarchy and its conquests.

Again the second couple is connected with J.

The Third, xxiv. 3-9, also celebrates the glory and conquests of the monarchy.

Agag, in verse 7, can hardly be the Amalekite king of 1 Sam. xvi.; Amalek was too small and obscure. The Septuagint and other Greek Versions and Sam. Pent. have Gog, which would imply a post-exilic date, cf. Ezek. xxxix. Probably both Agag and Gog are textual corruptions. Of has been suggested, but does not seem a great improvement.

The Fourth, xxiv. 14-19, announces the coming of a king, possibly David, who shall conquer Edom and Moab.

The remaining poems are usually regarded as later additions; thus the Oxford Hexateuch on Num. xxiv. 20-24. "The three concluding oracles seem irrelevant here, being concerned neither with Israel nor Moab. It has been thought that they were added to bring the cycle up to seven."

The Fifth, xxiv. 20, deals with the ruin of Amalek. It is of uncertain date; if the historical Amalek is meant, it may be early; but Amalek may be symbolic.

The Sixth, xxiv. 21 f., deals with the destruction of the Kenite state by Assyria; also of uncertain date, Assyria being, according to some, the ancient realm of Nineveh, according to others the Seleucid kingdom of Syria, which was also called Assyria.

The Seventh, xxiv. 23 f., speaks of the coming of ships from the West, to attack Assur and "Eber"; it may refer to the conquest of Persia by Alexander the Great. An interesting, but doubtful, emendation makes this poem describe the ruin of Shamal, a state in N. W. Syria.

In the New Testament Balaam is cited as a type of avarice; in Rev. iii. 14 we read of false teachers at Pergamum who held the "teaching of Balaam, who taught Balak to cast a stumbling-block before the children of Israel, to eat things sacrificed to idols, and to commit fornication."

Balaam has attracted much interest, alike from Jews, Christians and Mahomedans. Josephus paraphrases the story more suaviter, and speaks of Balaam as the best prophet of his time, but with a disposition ill adapted to resist temptation. Philo describes him in the Life of Moses as a great magician; elsewhere he speaks of "the sophist Balaam, being, i.e. symbolizing, a vain crowd of contrary and warring opinions," and again as "a vain people"; both phrases being based on a mistaken etymology of the name Balaam. The later Targums and the Talmudic authors represent him as a typical sinner; and there are the usual worthless Rabbinical fables, e.g. that he was blind of one eye; that he was the Elisha of Job; that, as one of Pharaoh's counsellors, he was governor of a city of Ethiopia, and rebelled against Pharaoh; Moses was sent against him by Pharaoh at the head of an army, and stormed the city and put Balaam to flight, &c. &c.
Curiously enough, the Rabbinical (Yalkut) identification of Balaam with Laban, Jacob's father-in-law, has been revived from a very different standpoint, by a modern critic. The Mahomedans, also, have various fables concerning Balaam. He was one of the Anakim, or giants of Palestine; he had a number of books of Abraham, where he was called Yahweh, by virtue of which he predicted the future, and got from God whatever he asked. It has been conjectured that the Arabic wise man, commonly called Luqman (q.v.), is identical with Balaam. The names of their fathers are alike, and "Luqman" means desovler, swallowor, a meaning which might be got out of Balaam by a popular etymology.

If we might accept the various theories mentioned above, Balaam would appear in one source of the E as an Edomite, in another as an Ammonite; in I as a native of the south of Judah or possibly as an Arabean; in the tradition followed by the Priestly Code probably as a Midianite. All these peoples either belong to the Hebrew stock or are closely connected with it. We may conclude that Balaam was an ancient figure of traditions originally common to all the Hebrews and their allies, and afterwards appropriated by individual tribes; much as there are various St Georges.

The chief significance of the Balaam narratives for the history of the religion of Israel is the recognition by J and E of the genuine inspiration of a non-Hebrew prophet. Yahweh is as much the God of Balaam as he is of Moses. Probably the original tradition goes back to a time when Yahweh was recognized as a deity of a circle of connected tribes of which the Israelite tribes formed a part. But the retention of the story without modification may imply a continuous recognition through some centuries of the idea that Yahweh revealed his will to nations other than Israel. Apparently the Priestly Code ignored this feature of the story.

Taking the narratives as we now have them, Balaam is a companion figure to Jonah, the prophet who wanted to go where he was not sent, over against the prophet who ran away from the mission to which he was called.

BALADHURU (Abu-l-'Abbās Ahmad ibn Yahyā ibn Ǧibrīl al-Baladhurī), Arabian historian, was a Persian by birth, though his sympathies seem to have been strongly with the Arabs, for 'Abūl-'Abbās refers to one of his works in which he refuted the Shī'ī slaves (see Abū Ubaīda). He lived at the court of the caliphs al-Mutawakkil and al-Musta'īn and was tutor to the son of al-Mu'tazz. He died in 892 as the result of a drug called baladhur (hence his name). The work by which he is best known is the Fatḥ al-‘Ulūm (Conquests of Lands), edited by M. J. de Goeje as Liber expugnationis regionum (Leiden, 1870; Cairo, 1901). This work is a digest of a larger one, which is now lost. It contains an account of the early conquests of Mahomet and the early caliphs. Baladhurī is said to have spared no trouble in collecting traditions, and to have visited various parts of north Syria and Mesopotamia for this purpose. Another great historical work of his was the Ansāb al-‘Āṣrāf (Genealogies of the Nobles), of which he is said to have written forty parts when he died. Of this work the eleventh book has been published by W. Ahlwardt (Greifswald, 1883), and another part is known in manuscript (see Journal of the German Oriental Society, vol. xxxvii. pp. 382–406). He also made some translations from Persian into Arabic. (G. W. T.)

BALAGHAT (i.e. "above the ghats or passes," the highlands), a district of British India in the Nagpur division of the Central Provinces. The administrative headquarters are at the town of Burha. The district contains an area of 3,132 sq. m. It forms the eastern portion of the central plateau which divides the province from east to west. These highlands, formerly known as the Raigarh Bichia tract, remained desolate and neglected until 1866, when the district of Balaghat was formed, and the country opened to the industrious and enterprising peasantry of the Wainganga valley. Geographically the district is divided into three distinct parts: (1) The southern lowlands, a slightly undulating plain, comparatively well cultivated and drained by the Wainganga, Bagh, Deo, Ghisri and Son rivers; (2) the long narrow valley known as the Mau Taluka, lying between the hills and the Wainganga river, and comprising a long, narrow, irregular-shaped lowland tract, intersected by hill ranges and peaks covered with dense jungle, and running generally from north to south. (3) The lofty plateau, in which is situated the Raigarh Bichia tract, comprising irregular ranges of hills, broken into numerous valleys, and generally running from east to west. The highest points in the hills of the district are as follows:—Peaks above Lanja, 2,300 or 2,500 feet; Tepagarh hill, about 2,600 ft.; and Bhainsaghat range, about 3,000 ft. above the sea. The principal rivers in the district are the Wainganga, and its tributaries, the Bagh, Nahra and Uskai; a few smaller streams, such as the Masmor, the Mahkara, &c.; and the Banjar, Halon and Jamunia, tributaries of the Nerbudda, which drain a portion of the upper plateau. In the middle of the 19th century the upper part of the district was an impenetrable waste. About that time one Lachmann Naik established the first village on the plateau, and a handsome Buddhist temple of cut stone, belonging to some remote period, is suggestive of a civilization which had disappeared before historic times. The population in 1901 was 326,521, showing a decrease of 15% in the decade, due to the effects of famine. A large part of the area is still covered with forest, the most valuable timber-tree being sal. There are few good roads. The Gondia-Jubbulpore line of the Bengal-Nagpur railway traverses the Wainganga valley in the west of the district. The district suffered very severely from the famine of 1867–1869. It suffered again in 1900, when in April the number of persons relieved rose above 100,000.

BALAGUER, VICTOR (1824–1901), Spanish politician and author, was born at Barcelona on the 11th of December 1824, and was educated at the university of his native town. His precocity was remarkable; his first dramatic essay, Pepin el jarobado, was placed on the Barcelona stage when he was fourteen years of age, and at nineteen he was publicly "crowned" after the production of his second play, Don Enrique el Daddinor. From 1843 to 1868 he was the chief of the Liberal party in Barcelona. He was also a handsome minister of the interior, a capable, discreet and benevolent premier and editor of El Conseller did much to promote the growth of local patriotism in Catalonia. But it was not till 1857 that he wrote his first poem in Catalan—a copy of verses to the Virgin of Montserrat. Henceforward he frequently adopted the pseudonym of "El Trovador de Montserrat"; in 1859 he helped to restore the "Juegos Florales," and in 1861 he was proclaimed mestre de gay saber. He was removed to Madrid, took a prominent part in political life, and in 1867 emigrated to Provence. On the expulsion of Queen Isabella, he returned to Spain, represented Manresa in the Cortes, and in 1871–1872 was successively minister of the colonies and of finance. He resigned office at the restoration, but finally followed his party in rallying to the dynasty; he was appointed vice-president of congress, and was subsequently a senator. He died at Madrid on the 14th of January 1901. Long before his death he had become alienated from the advanced school of Catalan nationalists, and endeavored to explain away the severe criticism of Castile in which his Historia de Catalunya y de la Corona de Aragon (1866–1869) abound. This work, like his Historia politico y literaria de los trovadores (1878–1879), is inaccurate, partial, and unscholarly; but both books are attractively written and have done great service to the cause which Balaguer once upheld. As a poet he is imitative: reminiscences of Quintana are noticeable in his patriotic songs, of Zorrilla in his historical ballads, of Byron in his lyrical poems. He wrote too hastily to satisfy artistic canons; but if he has the faults he has also the merits of a pioneer, and in Catalonia his name will endure.
BALAKIREV—BALANCE

BALAKIREV, Mili Alexeievich (1836–1910), Russian musical composer, was born at Nijni-Novgorod on the 31st of December 1836. He had the advantage as a boy of living with Tchaikovsky, author of a Life of Musica; he knew the band, and from whom Balakirev obtained a valuable education in music. At eighteen, after a university course in mathematics, he went to St Petersburg, full of national ardour, and there made the acquaintance of Glinka. Round him gathered César Cui (b. 1835), and others, and in 1862 the Free School of Music was established, by which, and by Balakirev's personal zeal, the modern school of Russian music was largely stimulated. In 1869 Balakirev was appointed director of the imperial chapel and conductor of the Imperial Musical Society. His influence as a conductor, and as an organizer of Russian music, give him the place of a founder of a new movement, apart even from his own compositions, which though few in number are remarkable in themselves. His works consist largely of songs and collections of folk-songs, but include a symphony (first played in England in 1901), two symphonic poems ("Russia" and "Tamara"), and four ouvertures, besides pianoforte pieces. His orchestral works are of the "programme-music" order, but are brilliant examples of the highly coloured, elaborate style characteristic of modern Russian composers, and developed by Balakirev's discipies, such as Borodin and Rimsky-Korsakov.

BALAKLAVA, a village in the Crimea, east of Sevastopol, famous for a battle in the Crimean War. The action of Balaklava (October 25th, 1854) was brought about by the advance of 9th Light Dragoons, under General Liprandi, to attack the allied English, French and Turkish forces besieging Sevastopol. The ground on which the engagement took place was the Vorontsov ridge (see CRIMEAN WAR), and the valleys on either side of it. Liprandi's corps formed near Traktor Bridge, and early on the 25th of October its advanced guard moved southward to attack the ridge, which was weakly occupied by Turkish battalions behind slight entrenchments. The two nearest British divisions were put into motion as soon as the firing became serious, but were prevented by their orders from descending to once in the plain, and the Turks had to meet the assault of greatly superior numbers. They made a gallant resistance, but the Russians quickly cleared the ridge, capturing several guns, and their first line was followed by a heavy mass of cavalry which crossed the ridge and descended into the Balaklava plain. At this moment the British cavalry division under the earl of Lucan was in the plain, but their commander was prevented from engaging the Russians by the tenor of his orders. One of his brigades, the Heavy 4th and 5th Dragoon Guards, 1st, 2nd and 6th Dragoons) under Brigadier-General J. Y. Scarlett, was in the Balaklava plain; the other, the Light Brigade under Lord Cardigan (4th and 15th Light Dragoons now Hussars, 8th and 17th Hussars and the Lancers) in the valley to the north of the Vorontsov ridge. All these regiments were very weak in numbers. The Russian cavalry mass, after crossing the ridge, moved towards Balaklava; a few shots were fired into it by a Turkish battery and a moment later the Heavy Brigade charged. The attack was impeded at first by obstacles of ground, but in the mêlée the weight of the British troops gradually broke up the enemy, and the charge of the 4th Dragoon Guards, delivered against the flank of the Russian mass, was decisive. The whole of the Russian cavalry broke and fled to the ridge. This famous charge occupied less than five minutes from first to last, and at the same time some of the Russian squadrons, attempting to charge the 3rd Highlanders (who were near Balaklava) were met by the steady volleys of the "thin red line," and fled with the rest. The defeated troops retreated past the still inactive Light Brigade, on whose left a French cavalry brigade was now posted. The Russians were at this juncture reinforced by a mixed force on the Fedkukhine heights; Liprandi's infantry occupied the captured ridge, and manned the guns taken from the Turks. The cavalry defeated by the Heavy Brigade was re-formed in the northern valley behind the field guns, and infantry, cavalry and artillery were on both the Fedkukhine and the Vorontsov heights. Thus, in front of the Light Brigade was a valley over a mile long, at the end of which was the enemy's cavalry and twelve guns, and on the ridges on either side there were in all twenty-two guns, with cavalry and infantry. It was under these circumstances that an order was given to move the British headquarters, which led to the charge for which above all Balaklava is remembered. It was carried to Lord Lucan by Captain L. E. Nolan, 15th Hussars, and ran as follows:—"Lord Raglan wishes the cavalry to advance rapidly to the front and try to prevent the enemy carrying away the guns . . . French cavalry is on your left." Lucan, seeing no attempt on the part of the enemy to move guns, questioned Nolan, who is said to have pointed down the valley to the artillery on the plain; whereupon Lucan rode to Lord Cardigan, the commander of the Light Brigade, and repeated Lord Raglan's order and Nolan's explanation. The Light Brigade then advanced straight to its front, and soon came under fire from the guns on both flanks. Nolan was killed as he rode across the front of the brigade, perhaps with the intention of changing its direction to the Vorontsov ridge. Five minutes later the guns in front began to fire with telling effect. The pace was increased, though the "charge" was not sounded, and Cardigan and those of his men who remained mounted, rode up to and through the Russian line of guns. Small parties even charged the Russian cavalry in rear and on either flank. The French 4th Chasseurs d' Afrique made a charging charge which drove the Russians off the Fedkukhine heights, though at considerable loss. Lucan had meanwhile called up the Heavy Brigade to support the Light, but it lost one regiment and was quickly withdrawn, and when the two formed bodies of the Light Brigade found their way back, the 3rd Light Dragoons mustered but ten mounted men at the evening parade; the brigade as a whole had lost 247 men and 497 horses out of a total strength of 673 engaged in the charge, which lasted twenty minutes from first to last. The two divisions which now approached the field were again halted, and Liprandi was left undisturbed on the Vorontsov ridge and in possession of the captured guns. The result of the day was thus unfavourable to the allies, but the three chief incidents of the engagement—the two cavalry charges and the fight of the 3rd Highlanders—gave to it all the prestige of a victory. The impression created by the conduct of the Light Brigade was forcibly expressed in Tennyson's well-known ballad, and in spite of the equally celebrated remark of the French general Bosquet, "C'est magnifique mais ce n'est pas la guerre," it may be questioned whether the moral effect of the charge did not outweigh the very serious loss in trained men and horses involved.

BALSALKA, a stringed instrument said to have retained its primitive form unchanged, very popular in Russia among the peasants, more especially in Ukraine. The instrument has a triangular soundboard to which is glued a vaulted back, forming a body having a triangular base, enabling it to stand upright. To this body is added a fretted neck stringed with two, three or four strings, generally so tuned as to produce a minor chord when sounded together. The strings are generally plucked with the fingers, but the peasants obtain charming "glissando" effects by sweeping the strings lightly one after the other with the fingers or side of the hand. The Balalaika is common to the Slav races, who use it to accompany their folk-songs and dances. It is also to be seen in the hands of gypsies at rural festivities and fairs.

BALANCE (derived through the Fr. from the Late Lat. bilanitia, an apparatus for weighing, from bi, two, and lanx, a scale), a term originally used for the ordinary beam balance or weighing machine with two scale pans, but extended to include (with or without adjectival qualification) other apparatus for measuring and comparing weights and forces. In addition to beam and spring balances (see WEIGHING MACHINES), apparatus termed "torsion balances," in which forces are measured or compared by their twisting moment on a wire, are used, especially in gravitational, electrostatic and magnetic experiments (see GRAVITATION and ELECTROMETER). The term also connotes the idea of equality or equalization; e.g. in the following expressions: "balance," in bookkeeping, the amount which equalizes the debit and credit accounts; "balance wheel,"
in horology, a device for equalizing the relaxing of a watch or clock spring (see Clock); the "balancing of engines," the art of minimizing the total vibrations of engines when running, and consisting generally in the introduction of masses which induce vibrations opposed to the vibrations of the essential parts of the engine.

**Balance of Power**, a phrase in international law for such a "just equilibrium" between the members of the family of nations as should prevent any one of them from becoming sufficiently strong to enforce its will upon the rest. The principle involved in this, as Hume pointed out in his *Essay on the Balance of Power*, is as old as history, and was perfectly familiar to the ancients both as political theorists and as practical statesmen. In its essence it is no more than a precept of commonsense born of experience and the instinct of self-preservation; for, as Polybius very clearly puts it (lib. i. cap. 83): "Nor is such a principle to be despised, nor should so great a power be allowed to any one as to make it impossible for you afterwards to dispute with him on equal terms concerning your manifest rights."

It was not, however, till the beginning of the 17th century, when the science of international law took shape at the hands of Grotius and his successors, that the theory of the balance of power was first put forth as a principle of diplomacy. According to this the European states formed a sort of federal community, the fundamental condition of which was the preservation of the balance of power, i.e. such a disposition of things that no one state or potentate should be able absolutely to predominate and prescribe laws to the rest; and, since all were equally interested in this settlement, it was held to be the interest, the right and the duty of every power to interfere, even by force of arms, when any of the conditions of this settlement were infringed or assailed by any other member of the community. This principle, once formulated, became an axiom of political science. It was impressed as such by Fénelon, in his *Instructions*, on the young duke of Burgundy; it was proclaimed to the world by Frederick the Great in his *Anti-Machiavel*; it was re-stated with admirable clearness in 1806 by Friedrich von Gentz in his *Fragmente on the Balance of Power*. It formed the basis of the coalitions against Louis XIV. and Napoleon, and the occasion, or the excuse, for most of the wars which desolated Europe between the congress of Münster in 1648 and that of Vienna in 1814. It was during this period that the 19th century it was observed by the series of national upheavals which have remodelled the map of Europe; yet it underlay all the efforts of diplomacy to stay or to direct the elemental forces let loose by the Revolution, and with the restoration of comparative calm it has once more emerged as the motive for the various political alliances of which the ostensible object is the preservation of peace (see Europe: History).

An equilibrium between the various powers which form the family of nations is, in fact,—as Professor L. Oppenheim (*International Law*, i. 73)—justly points out—essential to the very existence of any international law. In the absence of any central authority, the only sanction behind the code of rules established by custom or defined in treaties, known as "international law," is the capacity of the powers to hold each other in check. Were this to fail, nothing could prevent any state sufficiently powerful from ignoring the law and acting solely according to its convenience and its interests.

See, besides the works quoted in the article, the standard books on International Law (q.v.).

**Balance of Trade**, a term in economics belonging originally to the period when the "mercantile theory" prevailed, but still in use, though not quite perhaps in the same way as at its origin. The "balance of trade" was then identified with the sum of the precious metals which a country received in the course of its trading with other countries or with particular countries. There was no doubt an idea that somehow or other the amount of the precious metals received represented profit on the trading, and each country desired as much profit as possible. Princes and sovereigns, however, with political aims in view, were not close students of mercantile profits, and would probably have urged the acquisition of the precious metals as an object of trade even if they had realized that the country as a whole was exporting "money's worth." In order to buy the precious metals which were desired for political objects. The "mercantile theory" was exploded by Adam Smith's demonstration that gold and silver were only commodities like others with no special virtue in them, and that when they would come into a country when there was a demand for them, according to the amount, in proportion to other demands, which the country could afford to pay; but the ideas in which the theory itself has originated have not died out, and the idea especially of a "balance of trade" to which the rulers of a country should give attention is to be found in popular discussions of business topics and in politics, the general notion being that a nation is prosperous when its statistics show a "trade balance" in its favour and unprosperous when the reverse is shown. In modern times the excess of imports over exports or of exports over imports, shown in the statistics of foreign trade, has also come to be identified in popular speech with the "balance of trade," and many minds are no doubt imbued with the ideas (1) that an excess of imports over exports is bad, and (2) an excess of exports over imports is the reverse, but it would be a mistake to regard these as "favourable," and the latter as "favourable" trade balance. In the former case it is urged that a nation so circumstanced is living on its capital. Exact remedies are not suggested, although the idea of preventing or hampering foreign imports as a means of developing home trade and of thus altering the supposed disastrous trade balance is obviously the logical inference from the arguments. A consideration of these ideas and of recent discussions about imports and exports, appears accordingly to be needed, although the "mercantile theory" itself is exploded.

The phrase "balance of trade," then, appears to be an application of a trader's language in his own business to the larger affairs of nations or rather of the aggregate of individuals in a nation engaged in foreign trade. A trader in his own books sets his sales against his purchases, and the amount by which the former exceed the latter is his trade balance or profit. What is true of the individual, it is assumed, must be true of a nation or of the aggregate of individual traders in a nation engaged in the foreign trade. If their collective sales amount to more than their collective purchases, the balance of trade will be in their favour, and they will have more money on hand. Conversely, if their purchases amount to more than their sales, they will have to pay money, and they will presumably be living on their capital. The argument fails, however, in many ways. Even as regards the experience of the individual trader, it is to be observed that he may or may not receive his profit, if any, in money. As a rule he does not do so. As the profit accrues he may invest it either by employing labour to add to his machinery or warehouses, or by increasing his stock-in-trade, or by adding to his book debts, or by purchase of stocks or shares outside his regular business. At the end of a given period he may or may not have an increased cash balance to show as the result of his profitable trading. Even if he has an increased cash balance, according to the modern system of business, this might be a balance at his bankers', and they in turn may have invested the amount so that there is no stock of the precious metals, of "hard money," anywhere to represent it. And the argument fails still further when applied to the transactions between nations, or rather, to use the phrase already employed, between the aggregate of individuals engaged in foreign trade. It is quite clear that if a nation or the individuals of a nation do make profit in their foreign trading, the amount may be invested as it accrues—in machinery, or warehouses, or stock-in-trade, or book debts, or stocks and shares purchased abroad, so that there may be no corresponding "balance of trade" to bring home. There is no doubt also that what may be is in reality what largely happens. A prosperous foreign trade carried on by any country implies a continuous investment by that country either abroad or at home, and there may or may not be a balance receivable in actual gold and silver.
In another particular, the argument also fails. In the aggregate of individual trading with various countries, there may sometimes be purchases and sales as far as the individuals are concerned, but not purchases and sales as between the nations. For example, goods are exported from the United Kingdom, ammunition and stores and ships, which appear in the British returns as exports, and which have really been sold by individual British traders to individuals abroad; but these sales are not set off by any purchases on the other side which come into the international account, as the set-off is a loan by the people of one country to the people or government of another. The same with the export of railway and other material when goods are exported for the purpose of constructing railways or other works abroad. The sales are made by individuals in the United Kingdom to individuals abroad; but there is no set-off of purchases on the other side. Mutatis mutandis the same explanation applies to the remittance of goods by one country to another, or by individuals in one country to individuals in another to pay the interest or repay the capital of loans which have been received in former times. These are all cases of the movement of goods irrespective of individual sales and purchases, though the movements themselves appear in the international records of imports and exports, and therefore it seems to be assumed, though without any warrant, in the international records of the balance of trade. There is yet another failure in the comparison. The individual trader would include in his sales and purchases services such as repairs performed by him for others, and similar services which others do for himself; but no similar accounts are kept of the corresponding portions of international trade such as the earning of freights and commissions, although in strictness, it is obvious, they belong as much to international trade as the imports and exports themselves, which cannot therefore show a complete balance of trade.

The illusions which may result then from the confusion of ideas between a balance of trade or profit, and a balance of cash paid or received, and from the identification of an excess of imports over exports or of exports over imports with the balance of trade itself, though they are not the same things, hardly need description. The believers in such illusions are not entitled to any hearing as economists, however, much they may be accepted in the market-place or among politicians.

The "balance of trade" and the "excess of imports over exports" are thus simply pitfalls for the amateur and the unwise. On the statistical side, moreover, there is a good deal more to be urged in order to impress the student with care and attention. The records of imports and exports themselves may vary from the actual facts of international purchases and sales. The actual values of the goods imported and paid for by the nation may vary from the published returns of imports, which are, by the necessity of the case, only estimated values. And so with the exports. The actual purchases and sales may be something very different. A so-called sale may prove abortive through its not being paid for at all, the debtor failing altogether. In any case the purchases of a year may not be paid for by the sales of the year, and the "squaring" of the account may take a long time. Again, the actual transactions may have been set off as not to give an approximately correct account as far as the records go. Thus in the plan followed in the United Kingdom imports are valued as at the port where they arrive and exports at the port where they are despatched from—a plan which so far places them on an equal footing for the purpose of striking a balance of trade. But in the import and export records of the United States a different plan is followed. The imports are no longer valued as at the port of arrival with the freight and other charges included, but as at the port of shipment. The results on the balance of trade drawn out must accordingly be quite different in the two cases. With other countries similar differences arise.

To deduce then from records of imports and exports any conclusions as to the excess of imports or exports at different times is a work of enormous statistical difficulty. Excellent illustrations will be found in J. Holt Schooling's British Trade Book (1908).

The country which presents the most interesting questions in connexion with the study is the United Kingdom, with its largely studied foreign trade. Its annual imports and exports, excluding bullion, averaged 500 millions sterling, and the bullion one year with another is 100 millions more. Such facts, moreover, between the middle and end of the 19th century gradually rose from a small figure to 180 millions sterling annually, and occasioned the popular discussion referred to respecting an "adverse" balance of trade, and particularly the belief existing in many quarters that the nation is living on its capital. The result has been a new investigation of the subject, so as to bring out and present the credits to which the country is entitled in its trade as a shipowner and commission merchant, and to exhibit at the same time the magnitude of British foreign investments, which cannot be less than 2000 millions sterling and must bring in an enormous annual income. Other countries such as France, Germany, Belgium, Holland, Denmark, Norway and Sweden, are in the same condition, though their foreign trade is not on the same scale, and similar rules apply to the reading of their import and export accounts. The United States is a conspicuous instance of a country which in the first decade of the 20th century was in the position of a borrower, instead of a lender, of exports, though there were signs of a change in the opposite direction. New countries generally, such as Canada, Australia and the South American countries, resemble the United States. Comparisons are made difficult by the want of uniformity in the methods of stating the figures, but that different countries have to be grouped according as they are indebted or creditor countries is undeniable, and no study of the trade statistics is possible without recognition of the underlying economic circumstances.

In conclusion it may be useful to repeat the main propositions laid down as to the balance of trade. (1) A "balance of trade" to the individual trader, from whose experience the phrase comes, is not necessarily, as is supposed, a balance received or receivable in the precious metals. It may be invested as it accrues—in machinery, or warehouses, or stock-in-trade, or in book debts, or in stocks and shares or other property outside the trader's business, as well as in cash. (2) What is true of the individual trader is also true of the aggregate of individuals engaged in the foreign trade of a country. Cash is only one of the forms in which they may elect to be paid. (3) The imports and exports recorded in the statistical returns of a country do not correspond with the purchases and sales of individual traders, as the sales especially may be set off by loans, while the so-called imports may include remittances of interest and of capital repaid. (4) When capital is repaid the country receiving it need not be living on it, but may be investing it at home. (5) The foreign trading of countries may also comprise many transactions, such as the earning of freights and commissions, which ought to appear in a proper account showing a balance of trade, as similar transactions appear in an individual trader's account, but which are not treated as imports or exports in the statistical returns of a nation's foreign trade. (6) Import and export returns themselves are not the same as accounts of purchases and sales; the values are only estimates, and must not be relied on literally without comparison with the consumption in the country. These estimates in different countries are not in all cases taken at the same point, there being important variations, for instance, in this respect between the returns of two great countries, the United Kingdom and the United States, which are often compared, but are really most difficult to compare. (8) The United Kingdom is a conspicuous instance of a country which has a great excess of imports over exports in consequence of its large lending abroad in former times; while its accounts are specially affected by the magnitude of its services as a trading nation carrying passengers and goods all over the world, which do not result, however, in so-called "exports." The United States, on the other hand, is a conspicuous instance of an indebted nation, which has or had until lately few or no sums to its credit in foreign trade except the visible exports. (6) The various countries of the world naturally fall into groups. The nations of western Europe, such as France, Germany, Belgium, Holland, Sweden and Norway, fall into a
group with Great Britain as creditor nations, while Canada, Australasia and the South American countries fall into a group with the United States as undeveloped and indebted countries. So also of other countries, each belongs naturally to one group or another. (10) The excess of imports or exports may vary indefinitely at different times according to a creditor country is receiving or lending at the time, or according as a debtor country is borrowing or paying off its debts at the time, but the permanent characteristics are always to be considered.

(R.G.N.)

**Balanoglossus**, the general name given to certain peculiar, ovate, worm-like animals which live an obscure life under stones, and burrow in the sand from between tidal-marks down to the abyssal regions of the sea. Their colour is usually some tone of yellow with dashes of red, brown and green, and they frequently emit a pungent odour. The name has reference to the tongue-shaped muscular proboscis by which the animal works its way through the sand. The proboscis is not the only organ of locomotion, being assisted by the successor of the body, the buccal segment or collar. By the waves of contraction executed by the proboscis accompanied by inflation of the collar, progression is effected, sometimes with marvellous rapidity. The third body region or trunk may attain a great length, one or two feet, or even more, and is also muscular, but the tritural muscles are of subordinate importance in locomotion, serving principally to promote the peristaltic contractions of the body by which the food is carried through the gut. The sensory impressions of alimentation are closely associated with that of locomotion, somewhat as in the burrowing earthworm; in the excavation of its burrows the sand is passed through the body, and any nutrient matter that may adhere to it is extracted during its passage through the intestine, the exhausted sand being finally ejected through the vent at the orifice of the burrow and appearing at low tide as a worm cast. In accordance with this manner of feeding, the mouth is kept permanently open and prevented from collapsing by a pair of skeletal corona belonging to an anterior segment, the collar (or collar-gut), the body of which lies within the narrow neck of the proboscis; the latter is inserted into the collar and surrounded by the anterior free flap of this segment of the body.

When first discovered by J. F. Eschscholtz at the Marshall Islands in 1825, Balanoglossus was described as a worm-like animal belonging to the Echinoderma of Holothurians or sea-cucumbers. In 1865 Kowalevsky discovered that the organs of respiration consist of numerous pairs of gill-slits leading from the digestive canal through the thickness of the body-wall to the exterior. On this account the animal was subsequently placed by Gegenbaur in a special class of Ventres, the Enteropneusta. In 1883-1886 Bateson showed by his embryological researches that the Enteropneusta exhibit chordate (vertebrate) affinities in respect of the coelomic, skeletal and nervous systems as well as in regard to the respiratory system, and, further, that the gill-slits are formed upon a plan similar to that of the gills of Amphioxus, being subdivided by tongue-bars which depend from the dorsal borders of the slits.

**Collum and pore-canals.**—In correspondence with the tri-regional differentiation of the body in its external configuration, the collar (body-cavity, perivisceral cavity) is divided into three portions completely separated from one another by septa:—(1) proboscis-coelom, or first body-cavity; (2) the collar-coelom, or second body-cavity; (3) trunclal coelom, or third body-cavity. Of these divisions of the collar the first two communicate with the exterior by means of a pair of ciliated pore-canals placed at the posterior end of their respective segments. The proboscis-pores are highly variable, and frequently divided by a transverse wall in the same manner as the collar pore-canals of the proboscis unite to open by a common median orifice, and sometimes their communication with the proboscis-coelom appears to be occluded, and finally the pore-canals may be quite independent. The pore-canals of the collar appear for the first time in the third month; this is probably owing to the fact that they have become adapted to a special function, the inhalation of water to render the collar turbid during progression. There are reasons for supposing that the trunclal coelom is a third primitive cavity, which at one time communicated with the body-cavity, but on the unification of the proboscis-collum coelom appears to have become occluded, thus resulting in a vestige probably corresponding to the main body-cavity of the vertebrates. The various peculiarities in the form of the proboscis-gut is due to the presence of three main subsections in continuity with one another:—(1) proboscis-gut (Eicheldamm, stomochord, vide infra); (2) collar-gut (buccal cavity, throat); (3) trunclal gut extending from the collar to the body-cavity.

**Stomochord.**—The proboscis-gut appears as an outgrowth from the anterior dorsal wall of the collar-gut, and extends forward into the basal (posterior) region of the proboscis, through the neck into the proboscis, ending blindly in front. Although an integral part of the gut, it has ceased to assist in alimentation, but the epithelium undergoes various functional and histological changes. The nuchal skeleton appears in the notochord of the true ciliated column, but it is not directly comparable with the latter structure, being related to it solely by way of substitution. On account of the presence and mode of origin (from the gut-wall) of this organ Bateson introduced the term hemichorda as a phyletic name for this region of the gut.

As the proboscis-gut appears to have undoubtedly skeletal properties, and as it also has topographical relations with the mouth, it has been designated in English by the non-committal term stomochord. It is not a simple diverticulum of the collar-gut, but a complex structure possessing paired lateral pouches and a ventral convexity (ventral caecum) which rests in a concavity at the front end of the body (the nuchal skeleton (fig. 3)). In some species (Spengelidae) there is a long cavity in the stomochord which communicates with the proboscis-gut.

The nuchal skeleton is a non-cellular laminated thickening of the gutter membrane underlying that portion of the stomochord which lies between the above-mentioned pouches and the orifice into the throat. To this point we shall confine our attention to the anterior end of the body, the collar-gut which is in continuity with the wall of the stomochord (fig. 3).

**Nervous System.**—At the base of the epidermis (which is in general ciliated) there is over the entire surface of the body a layer of nerve-glia, occurring immediately outside the epidermis and separating the epidermis from the subjacent musculature. The nervous system is thus essentially epidermal in position and diffuse in distribution; but an interesting concentration of nerve-cells is often found in the stomochord, by taken as the origin of the trunclal nerve of the collar, the stomochord, closed in from the outside, opens in front and behind by anterior and posterior neuropores. This is the collar nerve-tube. Sometimes the central canal is wide and uninterrupted between the neuropores, in which case the number of small closed medullary cavities, and in others again it is obsolete. In one family, the **Ptychochorda**, the medullary tube of the collar is connected at intermediate points with the epidermis by pairs of variable number of unpaired outgrowths from its lateral wall, generally containing an axial lumen derived from and in continuity with the central canal. These hollow roots terminate blindly in the dorsal epidermis of the collar, and place the nervous layer of the collar directly in contact with the fibres of the collar nerve-tube. The exact significance of these roots is a matter for speculation, but it seems possible that they are epiphyseal structures remotely comparable with the epiphysial (pineal) complex of the cranial vertebrates. In accordance with this view there would be also some evidence in favour of regarding the collar nerve-tube of the Balanoglossus as the equivalent of the cerebral vesicle only of Amphioxus and the Ascidian tadpole, and also of the primary forebrain of vertebrates.

The thickening of the diffuse nervous layer of the epidermis occur in certain regions and along certain lines. In the neck of the proboscis the fibrous layer is greatly thickened, and other thickening of this layer occurs in the dorsal and ventral middle lines of the collar. By this means, the collar nerve-tube becomes separated from the epidermal nerve-tract is continued in front into the ventral wall of the collar nerve-tube, and at the point of junction there is a circular commissural thickening following the posterior rim of the collar and affording a special connexion between the dorsal and ventral nerve-tracts. From the ventral surface of the collar nerve-tube numerous motor fibres may be seen passing to the subjacent musculature. These fibres are not aggregated into roots.
Gill-slits.—The possession of gill-slits is as interesting a feature in the organization of Balanoglossus as is the presence of tracheae in *Peripatus*. These gill-slits occupy a vast extent of the anterior portion of the trunk, commencing immediately behind the collar-trunk septum. The branchial bars which constitute them are of two kinds:—(1) Septal bars between two contiguous clefts, corresponding to the primary bars in *Amphioxus*; (2) Tongue-bars. The chief resemblances between Balanoglossus and *Amphioxus* in the structure of the gill-slits may be stated briefly as follows:—(a) the presence of two kinds of branchial bars in all species and also of small cross-bars (synapta) in many species; (b) numerous gill-slits, from forty to more than a hundred pairs; (c) the addition of new gill-slits by fresh perforation at the posterior end of the pharynx throughout life. The chief differences are, that (a) the tongue-bar is the essential organ of the gill-slit in Balanoglossus, and exceeds the septal bars in bulk, while in *Amphioxus* the reverse is the case; (b) the tongue-bar contains a large coelomic space in Balanoglossus, but is solid in *Amphioxus*; (c) the skeletal rods in the tongue-bars of the pharynx of Balanoglossus are longer, and their presence is a peculiarity, and *Amphioxus*; (d) the tongue-bar of Balanoglossus does not fuse with the ventral border of the cleft, but ends freely below, thus producing a continuous U-shaped cleft. The meaning of this singular contrast between the two animals may be that we have here an instance of an interesting gradation in evolution. From serving as the essential organ of the cleft the tongue-bar may have undergone reduction and modification, becoming a secondary bar in *Amphioxus*, subordinate to the primary bars in size, vascularization and development; finally, in the cranate vertebrates it would then have completed its involution, the suggestion having been made that the tongue-bars are represented by the thymus-primordia.

Gill-pouches and Gill-pores.—Only rarely do the gill-slits open freely and directly to the exterior (fig. 1). In most species of *Balanoglossus* each gill-slit may be said to open into its own atrial chamber or gill-pouch; this in its turn opens to the exterior by a minute gill-pore. These pouches are, therefore, as many gill-pores as there are gill-slits and as many gill-pores as pouches. The gill-pores occur on each side of the dorsal aspect of the funnel and the branchial groove, the respiratory current of water is therefore conducted to the exterior by different means from that adopted by *Amphioxus*, and this difference is so great that the theory which seeks to explain it has to postulate radical changes of structure, function, and topography.

Excretory and Vascular Systems.—It seems likely that the coelomic pouches correspond to the gill-pouches, but in the existing Enteropneust the pore-canals (especially the collar canals) have, as we have seen, acquired new functions or become vestigial, and the function of excretion is now mainly accomplished by a structure peculiar to the *Enteropneust.* called the gomerulonema. This is a complex placed on either side of the anterior portion of the stomochord, projecting into the proboscis-cocloem. The vascular system of the body is quite peculiar, consisting of lacunae and channels destitute of endothelium, and surrounded with thin-walled basement membrane of the body-wall, of the gut-wall and of the mesenteries. The blood, which is a non-corpuscular fluid, is propelled forwards by the contractile dorsal vessel and collected into the central blood-sinus; this lies over the stomach, and is surrounded by three sides by a closed vessel, in which it is enclosed by efferent vessels which enter into a larger vessel, the sub-intestinal vessel in the trunk. The vascular system does not lend itself to morphological comparison between such widely different animals as *Balanoglossus* and *Amphioxus*, and the reader is referred to the memoirs cited at the end of this article for further details.

Reproductive System.—The sexes are separate, and when mature are sometimes distinguished by small differences of colour in the genital region. Both male and female gonads consist of more or less lobulated hollow sacs connected with the epidermis by short ducts. In their disposition they are either uniserial, biserial or multiserial. They occur in the branchial region, and also extend to a variable distance behind it. In exceptional cases they may be either confined to the branchial region or excluded from it. When

**Balanoglossus** are double; (d) the tongue-bar in Balanoglossus does not fuse with the ventral border of the cleft, but ends freely below, thus producing a continuous U-shaped cleft. The meaning of this singular contrast between the two animals may be that we have here an instance of an interesting gradation in evolution. From serving as the essential organ of the cleft the tongue-bar may have undergone reduction and modification, becoming a secondary bar in *Amphioxus*, subordinate to the primary bars in size, vascularization and development; finally, in the cranate vertebrates it would then have completed its involution, the suggestion having been made that the tongue-bars are represented by the thymus-primordia.

Gill-pouches and Gill-pores.—Only rarely do the gill-slits open freely and directly to the exterior (fig. 1). In most species of *Balanoglossus* each gill-slit may be said to open into its own atrial chamber or gill-pouch; this in its turn opens to the exterior by a minute gill-pore. These pouches are, therefore, as many gill-pores as there are gill-slits and as many gill-pores as pouches. The gill-pores occur on each side of the dorsal aspect of the funnel and the branchial groove, the respiratory current of water is therefore conducted to the exterior by different means from that adopted by *Amphioxus*, and this difference is so great that the theory which seeks to explain it has to postulate radical changes of structure, function, and topography.

Excretory and Vascular Systems.—It seems likely that the coelomic pouches correspond to the gill-pouches, but in the existing Enteropneust the pore-canals (especially the collar canals) have, as we have seen, acquired new functions or become vestigial, and the function of excretion is now mainly accomplished by a structure peculiar to the *Enteropneust.* called the gomerulonema. This is a complex placed on either side of the anterior portion of the stomochord, projecting into the proboscis-cocloem. The vascular system of the body is quite peculiar, consisting of lacunae and channels destitute of endothelium, and surrounded with thin-walled basement membrane of the body-wall, of the gut-wall and of the mesenteries. The blood, which is a non-corpuscular fluid, is propelled forwards by the contractile dorsal vessel and collected into the central blood-sinus; this lies over the stomach, and is surrounded by three sides by a closed vessel, in which it is enclosed by efferent vessels which enter into a larger vessel, the sub-intestinal vessel in the trunk. The vascular system does not lend itself to morphological comparison between such widely different animals as *Balanoglossus* and *Amphioxus*, and the reader is referred to the memoirs cited at the end of this article for further details.

Reproductive System.—The sexes are separate, and when mature are sometimes distinguished by small differences of colour in the genital region. Both male and female gonads consist of more or less lobulated hollow sacs connected with the epidermis by short ducts. In their disposition they are either uniserial, biserial or multiserial. They occur in the branchial region, and also extend to a variable distance behind it. In exceptional cases they may be either confined to the branchial region or excluded from it. When
which the genital pleurae are quite obsolete, and yet lateral septa occur (e.g. Ptychodera ruficollis), seeming to indicate that the pleural folds have in such cases been secondarily suppressed.

Development.—The development of Balanoglossus takes place according to two different schemes, known as direct and indirect, correlated with the occurrence in the two kinds of ova, large and small. Direct development, in which the adult form is attained without striking metamorphosis by a gradual succession of stages, offers the family Ptychodera and Spengelidae, containing two families of Enteropneusta, Ptychoderae and Spengelidae, with species of which probably all pursue an indirect course of development, culminating in a metamorphosis by which the adult form is attained. In these cases the larva, called Tornaria, is pelagic and transforms into a free-swimming larva, the ciliated and turbinal band, often drawn out into convoluted bays and lappets. In addition to this ciliated band the form of the Tornaria is quite characteristic and unlike the adult. The Tornaria larva offers sufficient to larva of Echinodermata (star-fishes, sea-cucumbers, and, when first discovered was so described. It is within the bounds of possibility that Tornaria actually does indicate a remote affinity on the part of the Enteropneusta to the Echinoderma, not only on account of its external form, but also by reason of the possession of a dorsal water-pore communicating with the anterior body-cavity. In the direct development Bateson showed that the three divisions of the coelom arise as pouches (constrictions from the archenteron or primitive gut, thus resembling the development of the mesoblastic somites of Amphiura. It would appear that while the direct development throws light upon the special plan of organization of the Enteropneusta, the indirect development affords clue to their possible derivation. In cases where this key by itself is insufficient for the rigorous definition of the circumscribed group like the Enteropneusta, which presents such a comparatively uniform plan of composition and of external form, should follow two such diverse methods of development.

Direct species of Balanoglossus are known, distributed among all the principal marine provinces from Greenland to New Zealand. The species which occurs in the English Channel is Ptychodera sertanis. The Ptychoderae and Spengelidae are tropical or subtropical, while the Balanoglossidae are predominantly arctic and temperate in their distribution. One of the most singular facts concerning the geographical distribution of Enteropneusta has recently been brought to light by Tattersall's discovery of Balanoglossus semi-stricto, on the coast of New Zealand hardly distinguishable from one occurring off Japan. Finally, Glandiceps absyrtica (Spengelidae) was dredged during the second Champlin expedition in the Atlantic Ocean near the Sea of Brazil and Peru, off part of South America.

BALARD, ANTOINE JEROME (1822-1876), French chemist, was born at Montpellier on the 30th of September 1802. He started as an apothecary, but taking up teaching he acted as chemical assistant at the faculty of sciences of his native town, and then became professor of chemistry at the royal college and school of pharmacy and at the faculty of sciences. In 1826 he discovered in sea-water a substance which he recognized as a previously unknown element and named bromine. The reputation brought him by this discovery he further increased his success to L. J. Thénard in the chair of chemistry at the faculty of sciences of Paris, and in 1851 he was appointed professor of chemistry at the Collège de France, where he had M. P. E. Berthelot first as pupil, then as assistant and finally as colleague. He died in Paris on the 30th of April 1876. While the discovery of bromine and the preparation of many of its compounds was his most conspicuous piece of work, Balard was an industrious chemist on both the pure and applied sides. In his researches on the bleaching compounds of chlorine he was the first to advance the view that bleaching-powder is a double compound of calcium chloride and hypochlorite; and he devoted much work to the problem of economically obtaining soda and potash from sea-water, whose efforts were nullified by the discovery of the much richer sources of supply afforded by the Stasentin deposits. In organic chemistry he published papers on the decomposition of ammonium oxide, with formation of oxamic acid, on amyyl alcohol, and on the difference in constitution between nitric and sulphuric ether.

BALA SERIES, in geology, a series of dark slates and sandstones with beds of limestone which occur in the neighbourhood of Bala, Merionethshire, North Wales. It was first described by A. Sedgwick, who considered it to be the upper part of his Cambrian System. The series is now placed at the top of the Ordovician System, above the Llandeilo beds. The Bala limestone is from 20 to 40 ft. thick, and is recognizable over most of North Wales; it is regarded as the equivalent of the Coniston limestone of the Lake District. The series in the type area consists of the Hirnant limestone, a thin inconstant bed, which is separated by 1400 ft. of slates from the Bala limestone, below this are more slates and volcanic rocks. The latter are represented by large contemporaneous deposits of tuff and jeticus lava which in the Snowdon District are several thousand feet thick. In South Wales the Bala Series contains the following beds in descending order:—the Trinuclea beds, the White Beds, the Llanbedr beds, the Greenhouse beds, the Bethesda beds, the Lower and Middle parts of the Llanberis Beds, the Rockingham Beds, the Llanberis Beds, the Lower and Middle parts of the Llanberis Beds, and the Upper part of the Llanberis Beds. The typical graptolites are, in the upper part, Dicellograsus acarus and D. complanatus; in the lower part, Pleurograpthus linearis and Dicranograpthus Cingani. In Shropshire this series is represented by the Cardac and Chibury Series; in southern Britain by the Hartfell and Ardmill Series, and by similar rocks in Ireland. See CARDAC SERIES and ORDOVICIAN SYSTEM.

BALASH (in the Greek authors, Balas; the later form of the name Vologaeses), Sassanian king in A.D. 484-488, was the brother and successor of Peroz, who had died in a battle against the Hephthalites (White Huns) who invaded Persia from the east. He put down the rebellion of his brother Zareh, and was praised as a mild and generous monarch, who made concessions to the Christians. But as he did nothing against his enemies, he was, after a reign of four years, deposed and blinded, and his nephew, Kavad I., raised to the throne.

BALASORE, a town and district of British India, in the Orissa division of Bengal. The town is the principal one and the administrative headquarters of the district, and is situated on the right bank of the river Burabalg, about 5 m. from the sea-coast as the crow flies and 16 m. by the river. There is a station on the East Coast railway. The English settlement of Balasore, formed in 1842, and that of Pipil in its neighbourhood seven years earlier, became the basis of the future greatness of the British in India. The servants of the East India Company here fortified themselves in a strong position, and carried on a brisk investment in country goods, chiefly cottons and muslins. They flourished in spite of the oppressions of the Moghomedan governors, and when needed asserted their claims to respect by arms. In 1688, affairs having come to a crisis, Captain William Heath, commander of the company's ships, bombarded the town. In the 18th century Balasore rapidly declined in importance, on account of a dangerous bar which formed across the mouth of the river. At present the bar has 12 to 15 ft. of water at spring-tides, but not more than 2 or 3 ft. at low water in the dry season. Large ships have to anchor outside in the open roadstead. The town still possesses a large maritime trade, despite the shifting-up of the river mouth.

The district forms a strip of alluvial land between the hills and the sea, varying from about 9 to 34 m. in breadth; area, 2085 sq. m. The hill country rises from the western boundary line. The district naturally divides itself into three well-defined tracts—(1) The salt tract, along the coast; (2) The arable tract, or rice country; and (3) the submuntane tract, or jungle lands. The salt tract runs the whole way down the coast, and forms a desolate strip a few miles broad. Towards the beach it rises into sandy ridges, from 50 to 80 ft. high, sloping inland and covered with a
vegetation of low scrub jungle. Sluggish brackish streams creep along between banks of fetid black mud. The sandhills on the verge of the ocean are carpeted with creepers and the wild convolvulus. Inland, it spreads out into prairies of coarse long grass and scrub jungle, which harbour wild animals in plenty; but throughout this vast region there is scarcely a hamlet, and only patches of rice cultivation at long intervals. From any part of the salt tract one may see the boundary of the inner arable part of the district fringed with long lines of trees, from which every morning the villagers drive their cattle out into the saliferous plains to graze. The salt tract is purely alluvial, and appears to be of recent date. Towards the coast the soil has a distinctly saline taste.

Salt used to be largely manufactured in the district by evaporation, but the industry is now extinct. The arable tract lies beyond the salt lands, and embraces the chief part of the district. It is a long dead-level of rich fields, with a soil lighter in colour than that of Bengal or Behar; much more friable, and apt to split up into small cubes with a rectangular cleavage. A peculiar feature of the arable tract is the Páts (literally cups) or depressed lands near the river-banks. They were probably marshes that have partially silted up by the yearly overflow of the streams. These páts bear the finest crops. As a whole, the arable tract is a treeless region, except around the villages, which are encircled by fine mango, pipal, banyan and tamarind trees, and intersected with green shady lanes of bamboo. A few palmyras, date-palms and screw-pines (a sort of aloe, whose leaves are armed with formidable triple rows of hook-shaped thorns) dot the expanse or run in straight lines between the fields. The submontane tract is an undulating country with a red soil, much broken up into ravines along the foot of the hills. Masses of laterite, buried in hard ferruginous clay, crop up as rocks or slabs. At Kopari, in Kila Ambohata, about 2 sq. m. are almost paved with such slabs, dark-red in colour, perfectly flat and polished like plates of iron. A thousand mountain torrents have scooped out the finest of the primitive ravines, clothed with an ever-verdure of prickly thorns, stunted grahoned shrubs, and here and there a noble forest tree. Large tracts are covered with sal jungle, which nowhere, however, attains to any great height.

Balasonde district is watered by six distinct river systems: those of the Subanreka, the Burabalong, the Jamka, the Kansbans and the Dhamara.

The climate greatly varies according to the seasons of the year. The hot season lasts from March to June, but is tempered by cool sea-breezes; from June to September the weather is close and oppressive; and from October to February the cold season brings the north-easterly winds, with cool mornings and evenings. Almost the only crop grown is rice, which is largely exported by sea. The country is exposed to destructive floods from the hill-rivers and also from cyclonic storm-waves. The district is traversed by the three main rivers, which have innumerable branches, and by the East Coast railway from Calcutta to Madras. The seaports of Balasore, Chandbili and Dhamara conduct a very large coasting trade. The exports are almost confined to rice, which is sent to Ceylon, the Maldivies and Mauritius. The imports consist of cotton twist and piece goods, mineral oils, metals, betel-nuts and salt. In 1901 the population was 1,071,977, an increase of 9% in the decade.

**BALASORO.**

**BALATON (PLATINESS).** The largest lake of middle Europe, in the south-west of Hungary, situated between the counties of Veszprém, Zala and Somogy. Its length is 48 m., average breadth 3/4 to 43 m., greatest breadth 7/2 m., least breadth a little less than 1 m. It covers 266 sq. m. and has an extreme depth of 149 ft. Its northern shores are bordered by the beautiful basaltic cones of the Bakony mountains, the volcanic soil of which produces grapes yielding excellent wine; the southern consist partly of a marshy plain, partly of downs. The most beautiful point of the lake is that where the peninsula of Tihany projects in the waters. An ancient church of the Benedictines is here situated on the top of a hill. In a tomb therein is buried Andrey I. (d. 1061), a king of the Hungarian Arpadian dynasty. The temperature of the lake varies greatly, in a manner resembling that of the sea, and many connect its origin with a sea of the Miocene period, the external parts of which are said to have covered the Hungarian plain. About fifty streams flow into the lake, which drains into the Danube and is well stocked with fish. It often freezes in winter. Lake Balaton is of growing importance as a bathing resort.

**BALAYAN,** a town and port of entry of the province of Batangas, Luzon, Philippine Islands, at the head of the Gulf of Balayan, about 55 m. S. by W. of Manila. Pop. (1903) 8493. Subsequently in October 1903, Calatagan (pop. 2654) and Tuy (pop. 2430) were annexed. Balayan has a healthful climate, and is in the midst of a fertile district (with a volcanic soil), which produces rice, cane-sugar, cacao, coffee, pepper, cotton, Indian corn, fruit (oranges, bananas, mangoes, &c.) and native dyes. Horses and cattle are raised for market in considerable numbers. The fisheries are important. The native language is Tagalog.

**BALBI,** ADRIAN (1782–1848), Italian geographer, was born at Venice on the 25th of April 1782. The publication of his Prospetto politico-geografico dello stato attuale del globo (Venice,
1808) obtained his election to the chair of professor of geography at the college of San Michele at Murano; in 1811-1813 he was professor of physics at the Lyceum of Fermo, and afterwards became attached to the customs office at his native city. In 1820 he visited Portugal, and there collected materials for his Essai statistique sur le royaume de Portugal et d’Algourse, published in 1822 at Paris, where the author resided from 1821 until 1832. This was followed by Variétés politiques et statistiques de la monarchie portugaise, which contains some curious observations respecting that country under the Roman sway. In 1826 he published the first volume of his Atlas ethnographique du globe, ou classification des peuples anciens et modernes d’après leurs langues, a work of great erudition. In 1832 appeared the Abrégé de Géographie, which, in an enlarged form, was translated into the principal languages of Europe. Balbi retired to Padua and there died on the 14th of March 1848. His son, Eugenio Balbi (1812-1854), followed a similar career, being professor of geography at Pavia, and publishing his father’s Scritti Geografici (Turin, 1841), and original works in Geo, ossia le terra (Trieste, 1854-1867) and Saggio de geografia (Milan, 1858).

**BALBO, CESARE, COUNT** (1759-1853), Italian writer and statesman, was born at Turin on the 21st of November 1759. His father, Prospero Balbo, who belonged to a noble Piedmontese family, held a high position in the Sardinian court, and the_INTEGER_ of Italy from foreign domination. His mother, a member of the Azeglio family, died when he was three years old; and he was brought up in the house of his great-grandmother, the countess of Bugino. In 1778 he joined his father at Paris. From 1808 to 1814 Balbo served in various capacities under the Napoleonic empire at Florence, Rome, Paris and in Illiria. On the fall of Napoleon he entered the service of his native country. While his father was appointed minister of the interior, he entered the army, and undertook political missions to Paris and London. On the outbreak of the revolution of 1821, of which he disapproved, although he was suspected of sympathizing with it, he was forced into exile; and though not long after he was allowed to return to Piedmont, all public service was denied him. Reluctantly, and with frequent endeavours to obtain some appointment, he gave himself up to literature as the only means left him to influence the destinies of his country. This accounts for the fitfulness and incompleteness of so much of his literary work, and for the practical, and in many cases temporary, element which runs through even his most elaborate productions. The great object of his labours was to hasten securing the Italian independence. To this end he had no expectation and no desire; but he was devoted to the house of Savoy, which he foresaw was destined to change the fate of Italy. A confederation of separate states under the supremacy of the pope was the genuine ideal of Balbo, as it was the ostensible one of Gioberti. But Gioberti, in his Primate, seemed to neglect the first essential of independence, which he accordingly inculcated in his Spontaneous or Hopes of Italy, in which he suggests that Austria should seek compensation in the Balkans for the inevitable loss of her Italian provinces. Preparation, both military and moral, alertness and patience were his constant theme. He did not desire revolution, but reform; and thus he became the leader of a moderate party, and the steady opponent not only of despotism but of democracy. At last in 1848 his hopes were to some extent satisfied by the constitution granted by the king. He was appointed a member of the commission on the electoral law, and became first constitutional prime-minister of Piedmont, but only held office a few months. With the ministry of d’Azeglio, which soon after got into power, he was on friendly terms, and had been continued the active defence of his political principles till his death on the 3rd of June 1853. The most important of his writings are historical-political, and derive at once their majesty and their weakness from his theocratic theory of Christianity. His style is clear and vigorous, and not unfrequently terse and epigrammatic. He published Quattro Novelle in 1830; Storia d’Italia sotto i Barbari in 1831; Vita di Dante, 1839; Meditazioni Storiche, 1842-1843; Le Speranze d’Italia, 1844; Pensieri sulla Storia d’Italia, 1858; Della Monarchia rappresentativa in Italia (Florence, 1857).

**BALBO, VASCO NUÑEZ DE** (c. 1475-1517), the discoverer of the Pacific, a leading figure among the Spanish explorers and conquerors of America, was born at Jerez de los Caballeros, in Estremadura, about 1475. Though poor, he was by birth a gentleman (hidalgo). Little is known of his life till 1501, when he followed Rodrigo de Bastidas in his voyage of discovery to the western seas. He appears to have settled in Hispaniola, and took to cultivating land in the neighbourhood of Salavtiera, but with no great success, as his debts soon became oppressive. In 1509 the famous Ojeda (Hojeda) sailed from San Domingo with an expedition and founded the settlement of San Sebastian. He had left orders with Enciso, an adventurous lawyer of the town, to fit out two ships and convey provisions to the new settlement. Enciso set sail in 1510, and Balbo, whose debts made the town unpleasant to him, managed to accompany him by concealing himself, it is said, in a cask of “virtuab for the voyage,” which was conveyed from his farm to the ship. The expedition reached San Sebastian to find Ojeda gone and the settlement in ruins. While Enciso was undecided how to act, Balbo proposed that they should sail for Darien, on the Gulf of Uraba. He had touched when with Bastidas. His proposal was accepted and a new town was founded, named Sta Maria de la Antigua del Darien; but quarrels soon broke out among the adventurers, and Enciso was deposed, thrown into prison and finally sent off to Spain with Balbo’s ally, the alcaldé Zamudio. Being thus left in authority, Balbo began to conquer the surrounding country, and by his bravery, courtesy, kindness of heart and just dealing gained the friendship of several native chiefs. On one of these excursions he heard for the first time, from the cacique Comogre, of the ocean on the other side of the mountains and of the gold of Peru. Soon after his return to Darien he received letters from Zamudio, informing him that Enciso had complained to the king, and had obtained a sentence condemnation Balbo and summoning him to Spain. In his despair at this message Vasco Nuñez resolved to attempt some great enterprise, the success of which he trusted would conciliate his sovereign. On the 1st of September 1513 he set out with one hundred and ninety Spaniards (Francisco Pizarro among them) and one thousand natives; on the 25th or 26th of September he reached the summit of the range, and sighted the Pacific. At once he sent four of his men, together with two others who were sent on to reconnoitre the coast, to Pavia, and two light brigantines were built, launched and armed. With these Vasco Nuñez now took possession of the Pearl Islands, and, having not been for the weather, would have reached the coast of Peru. But his career was stopped by the jealousy of Pedrarias, who pretended that Balbo proposed to throw off his allegiance, and enticed him to Acla, near Darien, by a crafty message. As soon as he had him in his power, he threw
him into prison, had him tried for treason, and forced the judge to condemn him to death. The sentence was carried into execution on the public square of Acla in 1517. From a reckless adventurer, Balboa had developed into an able general, an excellent colonial administrator, and a statesman of mature judgment and brilliant foresight.

BALBRIGGAN, a market-town and seaport of Co. Dublin, Ireland, in the north parliamentary division, 21° 30' m. N.N.E. of Dublin by the Great Northern railway. Pop. (1891) 2136. The harbour, though dry at low tides, has a depth of 14 ft. at high-water springs, and affords a good refuge from the east or southeast gales. There are two piers, and a railway viaduct of eleven arches crosses the harbour. The town has considerable manufactures of cottons and hosiery, "Balbriggan hose" being well known. The industry was founded by Baron Hamilton in 1761. There is some coast trade in grain, &c., and sea-fishery is prosecuted. Balbriggan is much frequented as a watering-place in summer.

BALBUS, literally "stammerer," the name of several Roman families. Of the Acilii Balb., one Manius Acius Balbus was consul in 150 B.C., another in 114. To another family belonged T. Ampius Balbus, a supporter of Pompey, but afterwards associated with Caesar (cf. Cic. ad Fam. vi. 12 and xii. 70). We know also of Q. Antonius Balbus, praetor in Sicily in 82 B.C., and Marcus Atius Balbus, who married Julia, a sister of Caesar, and had a daughter Atia, mother of Augustus. The most important name was the two Corneli Balbi, natives of Gades (Cadiz).

1. LUCIUS CORNELIUS BALBUS (called Major to distinguish him from his nephew) was born early in the last century B.C. He is generally considered to have been of Phoenician origin. For his services against Sertorius in Spain, the Roman citizenship was conferred upon him and his family by Pompey. Becoming friendly with all parties, he had much to do with the formation of the First Triumvirate, and was one of the chief financiers in Rome. He was careful to ingratiate himself with Caesar, whom he accompanied when praetor to Spain (61), and to Gaul (58) as chief engineer (praefectus fabrum). His position as a naturalized foreigner, his influence and his wealth naturally made Balbus many enemies, who in 56 put up a native of Gades to prosecute him for illegally assuming the rights of a Roman citizen, a charge directed against the triumphal equality with himself. Cicero, Pompey and Crassus all spoke on his behalf, and he was acquitted. During the civil war he endeavoured to get Cicero to mediate between Caesar and Pompey, with the object of preventing him from definitely siding with the latter; and Cicero admits that he was dissuaded from doing so, against his better judgment. Subsequently, Balbus became Caesar's private secretary, and Cicero was obliged to ask for his good offices with Caesar. After Caesar's murder, Balbus seems to have attached himself to Octavian; in 43 or 42 he was praetor, and in 40 consul—an honour then for the first time conferred on an alien. The year of his death is not known. Balbus kept a diary of the chief events in his own and Caesar's life (Suetonius, Caesar, 81). The 8th book of the Bell. Gall., which was probably written by his friend Hirtius at his instigation, was dedicated to him.

2. LUCIUS CORNELIUS BALBUS (called Minor), nephew of the above, received the Roman citizenship at the same time as his uncle. During the civil war, he served under Caesar, by whom he was entrusted with several important missions. He also took part in the Alexandrian and Spanish wars. He was rewarded for his services by being admitted into the college of pontiffs. In 43 he was questor in Further Spain, where he amassed a large fortune by plundering the inhabitants. In the same year he crossed over to Bogud, king of Mauretania, and is not heard of again until 21, when he appears as proconsul of Africa. Mommsen thinks that he had incurred the displeasure of Augustus by his conduct as praetor, and that his African appointment after so many years was due to his exceptional fitness for the post. In 19 Balbus defeated the Garamantes, and on the 27th of March in that year received the honour of a triumph, which was then for the first time granted to one who was not a Roman citizen by birth, and for the last time to a private individual. He built a theatre in the capital, which was dedicated on the return of Augustus from Gaul in 13 (Dio Cassius liv. 25; Pliny, Nat. Hist. xxxvi. 12. 60). Balbus appears to have given some attention to literature. He wrote a play of which the subject was his visit to Lentulus in the camp of Pompey at Dyrrhachium, and, according to Macrobius (Saturnalia, i. 6), was the author of a work called Byggeskild, dealing with the gods and their worship.

See Velleius Paterculus ii. 53; Cicero, ad Att. viii. 9; and on both the above the exhaustive articles in Fauly-Wissowa, Realencyclo-pädie, iv. pt. 1 (1900).

BALCONY (Ital. balcone from balco, scaffold; cf. O. H. Ger. balcho, beam, Mod. Ger. Balken, Engl. balk), a kind of platform projecting from the wall of a building, supported by columns or console brackets, and enclosed with a balustrade. Sometimes balconies are adapted for ceremonial purposes, e.g. that of St Peter's at Rome, whence the newly elected pope gives his blessing urbi et orbi. Inside churches balconies are sometimes provided for the singers, and in banqueting halls and the like for the musicians. In theatres the "balcony" was formerly a stage-box, but the name is now usually confined to the part of the orchestra not within the dress circle and below the gallery.

BALDE, JAKOB (1604-1668), German Latinist, was born at Ennsheim in Alsace on the 3th of January 1604. Driven from Alsace by the marauding bands of Count Mansfeld, he fled to Ingolstadt where he began to study law. A love disappointment, however, turned his thoughts to the church, and in 1624 he entered the Society of Jesus. Continuing his study of the humanities, he became in 1628 professor of rhetoric at Innsbruck, and in 1635 at Ingolstadt, whither he had been transferred by his superiors in order to study theology. In 1633 he was ordained priest. His lectures and poems had now made him famous, and he was summoned to Munich where, in 1638, he became court chaplain to the elector Maximilian I. He remained in Munich till 1650, when he went to live at Landshut and afterwards at Amberg. In 1654 he was transferred to Neuberg on the Danube, as court laureate and confessor to the count palatine. In the opinion of his contemporaries, Balde revived the glories of the Augustan age, and Pope Alexander VII. and the scholars of the Netherlands combined to do him honour. Herder regarded him as a greater poet than Horace. While such judgments are naturally exaggerated, there is no doubt that he takes a very high place among modern Latin poets. He died at Neuberg on the 30th of August 1668.

A collected edition of Balde's works in 4 vols. was published at Cologne in 1650; a complete edition in 8 vols. at Munich, 1729; also a good selection by J. Spach (Paris and Strassburg, 1871). An edition of his Latin lyrics appeared at Regensburg, 1559; and there are translations into English and into his finer odes, by J. Schrott and M. Schleich (Munich, 1870). See G. Westermayer, Jacobus Balde, sein Leben und seine Werke (1868); J. Bach, Jakob Balde (Freiburg, 1904).

BALDER, a Scandinavian god, the son of Odin or Othin. The story of his death is given in two widely different forms, by Saxo in his Gesta Danorum (ed. Holder, pp. 69 ff.), and in the prose Edda (Gylfaginning, cap. 49).

See F. Kauffmann, "Balder, Mythus and Sage" (Strassburg, 1902). For other works, see Teutonic Peoples, § 7.

BALDERICH, the name given to the author of a chronicle of the bishops of Cambrai, written in the 11th century. This Gesta episcoporum Cambracensium was for some time attributed to Balderic, archbishop of Noyon, but it now seems tolerably certain that the author was an anonymous canon of Cambrai. The work is of considerable importance for the history of the north of France during the 11th century, and was first published in 1615.

**Baldi, Bernardino** (1533–1617), Italian mathematician and miscellaneous writer, was descended of a noble family of Urbino, in which city he was born on the 6th of June 1533. He pursued his studies at Padua with extraordinary zeal and success, and is said to have acquired, during the course of his life, no fewer than sixteen languages, though according to Tiraboschi the inscription on his tomb limits the number to twelve. The appearance of the plague at Padua obliged him to retire to his native city, whence he was, shortly afterwards, called to act as tutor to Ferrante (Ferdinand) Gonzaga, from whom he received the rich abbey of Guastalla. He held office as abbot for twenty-five years, and then retired to his native town. In 1612 he was employed by the duke as his envoy to Venice, where he distinguished himself by the congratulatory oration he delivered before the Venetian senate on the election of the new doge, Andrea Memmo. Baldi died at Urbino on the 12th of October 1617. He was, perhaps, the most universal genius of his age, and is said to have written upwards of a hundred different works, the chief part of which have remained unpublished. His various works give satisfactory evidence of his abilities as a theologian, mathematician, geographer, antiquary, historian and poet. The *Crónica dei Matematici* (published at Urbino in 1709) is an abridgment of a larger work, on a subject which he yearly renewed and, in which he intended to contain the lives of more than two hundred mathematicians. His life has been written by Affò, Mazzuchelli and others.

**Baldinger, Ernst Gottfried** (1738–1804), German physician, was born near Erfurt on the 13th of May 1738. He studied medicine at Erfurt, Halle and Jena, and in 1761 was entrusted with the superintendence of the military hospitals connected with the Prussian encampment near Torgau. He published in 1765 a treatise *De Milium Morbis*, which met with a favourable reception. In 1768 he became professor of medicine at Jena, whence he removed in 1773 to Göttingen, and in 1785 to Marburg, where he died of apoplexy on the 21st of January 1804. Among his pupils were S. T. Sömmering and J. F. Blumenbach. Some eighty-four separate treatises are mentioned as having proceeded from his pen, in addition to numerous papers scattered through various collections and journals.

**Baldinucci, Filippo** (1624–1696), Italian writer on the history of the arts, was born at Florence. His chief work is entitled *Ragionamenti dei Pintori e degli Architettura* (dal 1260 sino al 1760), and was first published in six vols. 4to, 1681–1728. The capital defect of this work is the attempt to derive all Italian art from the schools of Florence. A good edition is that by Ranalli (5 vols. 8vo, Florence, 1845–1847). Baldinucci’s whole works were published in fourteen vols. at Milan, 1808–1812.

**Baldness** 1 (technically alopecia, from ἀλώπης, a fox, foxes often having bald patches on their coats), the result of loss of hair, particularly on the human scalp. So far as remediable alopecia is concerned, two forms may be distinguished: one the premature baldness so commonly seen in young men, due to alopecia seborea, the other alopecia areata, now regarded as an epidemic disease.

Alopecia seborea is that premature baldness so constantly seen, in which the condition steadily advances from the forehead backwards, until only a fringe of hair is left on the head. It is always due to the underlying disease seborrhoea, and though it progresses steadily if neglected, is yet very amenable to treatment. The two drugs of greatest value in this trouble are sulphanilamide and salicylic acid, some eighteen grains of each added to an ounce of vaseline making a good application. This should be rubbed well into the scalp daily for a prolonged period. Where the greasiness is objected to, the following salicylic lotion may be substituted, though the vaseline application has probably the greater value:

| AC. salicyl. 5i—vi; | Ol. ricini 5i—vi; | Ol. ros. geran. 5i; | Spt. vini ad 3v. |
